SCIENTIFIC AND TECHNICAL MOBILIZATION

TUESDAY, MARCH 30, 1943

UNITED STATES SENATE,
SUBCOMMITTEE ON SCIENTIFIC AND TECHNICAL
MOBILIZATION OF THE COMMITTEE ON MILITARY AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to call, at 2:30 p. m., in room 104–B, Senate Office Building, Senator Harley M. Kilgore (chairman) presiding.

Present: Senators Kilgore (chairman) and Wallgren.

Also present: Henry H. Collins, Jr., and Herbert Schimmel, of the committee staff.

Witness present: Hon. Thurman Arnold; also present: Robert M. Hunter and Joseph Borkin.

Senator KILGORE. The committee will come to order.

This is the first meeting of the subcommittee on S. 702 of the Committee on Military Affairs. I want to introduce S. 702 at this point and have it made part of the record.

(S. 702 was marked "Exhibit No. 1" and follows:)

EXHIBIT No. 1

[S. 702, 78th Cong., 1st sess.]

A BILL To mobilize the scientific and technical resources of the Nation, to establish an Office of Scientific and Technical Mobilization, and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

DECLARATION OF POLICY

SECTION 1. The Congress hereby recognizes that the full development and application of the Nation's scientific and technical resources are necessary for the effective prosecution of the war and for peacetime progress and prosperity, and that serious impediments thereto consist in—

the unassembled and uncoordinated state of information concerning existing scientific and technical resources;

the lack of an adequate appraisal, and the unplanned and improvident training, development, and use, of scientific and technical personnel, resources, and facilities in relation to the national need;

the consequent delay and ineffectiveness in meeting the urgent scientific and technical problems of the national defense and essential civilian needs;

the trend toward monopolized control of scientific and technical data and other resources with lack of access thereto in the public interest; and

the absence of an effective Federal organization to promote and coordinate, in the national interest, scientific and technical developments.

Digitized by Google

The purposes of this Act accordingly are—

(1) to appraise the current use of scientific and technical knowledge, facilities, and personnel, and to develop comprehensive national programs for the maximum use of science and technology in the national interest in periods of peace and war;

(2) to mobilize for the prosecution of the war all scientific and technical facilities and personnel;

(3) to facilitate after the war the transition of the national economy from the tasks of war to peacetime enterprise;

(4) to assemble, coordinate, and develop for use, in the public interest, all scientific and technical data and facilities; to facilitate access to scientific and technical information and literature and to aid and encourage the writing and publication thereof;

(5) to promote the full and speedy introduction of the most advanced and effective techniques—for the benefit of agriculture, manufacturing, distribution, transportation, communication, and other phases of productive activity; for economical and efficient Federal, State, and local government; and for the national defense and general welfare;

(6) to aid, encourage, and protect the research and enterprise of inventors, scientists, technicians, scientific and educational institutions, research laboratories and Government establishments engaged in scientific and technical work, and to make their resultant discoveries and data more readily available, and without discrimination, to all sections of industry, agriculture, and the public, in order to aid the war effort at the present time and in or order to promote full employment and higher standards of living after the war;

(7) to discover and develop substitutes for strategic and critical materials, and to promote the most beneficial use of agricultural, mineral, and other natural resources;

(8) to promote interest in scientific and technical education, and to provide for all qualified persons the means of scientific and technical training and employment;

(9) to provide guidance in scientific and technical matters to the President, the Congress, and all Federal, State, and local government agencies and establishments, and to contribute guidance and, in all proper cases, financial and other assistance to solution of the technical and scientific problems of industry, agriculture, and of any agency or establishment or individual inventor;

(10) to promote the maintenance and expansion of free enterprise by making available to smaller businesses the benefits of scientific advancement;

(11) to standardize, when in the public interest, scientific and technical designs, practices, and specifications; and

(12) to establish a national scientific and technical office to assure maximum cooperation and integration of the facilities and personnel of governmental and private agencies, institutions, and employers for the above purposes, and to coordinate the activity of these facilities and personnel, where necessary, in the national interest.

This Act may be cited as the "Science Mobilization Act."

DEFINITIONS

SEC. 2. As used in this Act—

(a) "Scientific and technical facilities" shall include real property and personal property, tangible and intangible, used or intended to be used for scientific or technical purposes, programs, research, projects, and developments and shall include further all methods, processes, procedures, techniques, designs, specifications, patents, inventions, and scientific or technical information or knowledge of every description used or intended to be used for scientific or technical purposes in research and development or in the production or supply of war or civilian goods or services.

(b) "Scientific and technical personnel" shall include all persons, excepting physicians and dentists, who have completed any course of study in any college or university in any branch of science or its practical application or who have had not less than an aggregate of six months' training or employment in any scientific or technical vocation.

(c) "Agency or establishment" shall mean any agency, board, department, office, bureau, or other body of the Federal or any State or local government,

Digitized by Google

or any person, firm, or partnership engaged in business for profit, or any corporation, profit or nonprofit, association, school, college, and university.

ESTABLISHMENT OF INDEPENDENT OFFICE

SEC. 3 (a) There is hereby created, as an independent agency of the Federal Government, the Office of Scientific and Technical Mobilization (hereinafter referred to as "the Office") which shall be administered by an Administrator to be appointed by the President, by and with the advice and consent of the Senate, and to serve at the pleasure of the President. The Administrator shall receive a salary at the rate of $12,000 a year. The Administrator shall appoint, fix the compensation, and define the authority and duties of such officers, employees, attorneys, and agents as he shall deem necessary to carry out the purposes and provisions of this Act and to transact the business of the Office. Such appointments shall be made in accordance with the provisions of the civil-service laws and regulations and the Classification Act of 1923, as amended: *Provided*, That when the Administrator determines it to be necessary in order to effectuate the purposes and provisions of this Act he may waive these requirements. The Office may make such reimbursement as it may deem necessary and proper for the traveling, subsistence, or other expenses incurred in the performance of official duties by its officers, employees, attorneys, agents, and by other persons or members of committees, boards, or other bodies designated by it to carry out such duties. The Office shall be located in or near the District of Columbia, but the Administrator may establish such branch offices outside the District of Columbia areas as may be required to carry out the purposes of the Act.

(b) Any person employed on a full-time basis by the Office shall receive no salary, wages, or other compensation from any source except the Office.

(c) There is hereby established within the Office a National Scientific and Technical Board (hereinafter referred to as the "Board") consisting of the Administrator, who shall be Chairman, and six other members, to be appointed by the President, and to include one representative each for industry, agriculture, labor, the consuming public, and two additional members at large who shall be scientists or technologists. Each such member shall receive compensation at the rate of $10,000 a year. The Board and its several members shall perform such duties under the direction and control of the Administrator as he may assign to them; they shall have access to all information of the Office relating to the administration thereof.

(d) There is hereby created a National Scientific and Technical Committee consisting of the Board, one representative each for each of such Federal departments as the President shall designate, four additional representatives of the consuming public, three additional scientists or technologists, and six additional members representing labor and six additional members representing management, including small business), in the major fields of production and service to be appointed by the President and to serve without compensation, to advise and consult with the Administrator, who shall be the Chairman thereof, upon the basic policies governing the administration of this Act. Such committee shall meet regularly, not less than once a month.

(e) There is hereby transferred to the Office the powers and personnel of the National Roster of Scientific and Specialized Personnel of the War Manpower Commission, together with its records, furniture, and equipment, and all its unexpended balances of appropriations or other funds available to carry out its powers and duties.

POWERS OF THE OFFICE

SEC. 4. To effectuate the purposes of this Act, the Office shall be vested with the following powers and duties which it shall exercise and perform under the direction and control of the Administrator:

(a) To take and keep a census of scientific and technical facilities, requirements, and personnel in the United States and its possessions and to provide archives for all scientific and technical material coming into the possession of the Government or any agency or department thereof.

(b) To formulate and promote projects and programs for the development and use of scientific and technical facilities and personnel and, when necessary, to initiate and carry out such projects.

(c) To foster and develop scientific and technical methods, to promote their application in the national welfare, either within the Office or by other auspices

Digitized by Google

public or private, and to promote and provide training and participation in science and in its application.

(d) To ascertain and assess scientific and technical developments in relation to, and to study their impact upon, the national welfare, or any particular category thereof.

(e) To solicit and to receive aid and support from any source for the advancement of scientific and technical methods.

(f) To coordinate the scientific and technical data, methods, and facilities of, or available to, all agencies and departments of the Federal Government.

(g) To foster international cooperation in scientific discovery and the application thereof; to acquire information with respect thereto from other countries and their nationals; to exchange scientific and technical personnel and information with such countries; and to engage in other suitable forms of international collaboration relating to science and technology.

(h) To make available, upon request, to the President, to the Congress, and to other persons or establishments (upon such conditions as the Administrator shall prescribe), technical guidance and assistance and any record or other data necessary therefor.

(i) To review specifications, standards, and designs of military and civilian products and services and their methods of production and supply and to recommend suitable simplifications and changes therein.

(j) To finance by loan, grant, exchange, purchase, or otherwise the operations or functions, or any of them, authorized by this Act, and, for the same purposes, to make or acquire any contract, guaranty, indemnity, stipulation, lease, or other instrument, to acquire, improve, and alter real and personal property, and to enter into any other transaction necessary or appropriate for the performance of its duties or powers.

(k) To acquire patents and patent rights, and to authorize the use thereof, subject to the provisions of section 7 of this Act, and to authorize the use or other disposition of any other property belonging to, or controlled by, the Office, upon such terms and conditions and for such compensation as the Administrator shall determine, which compensation shall be payable to the Office.

(l) To establish a system of merit awards to be granted to any agency, establishment, or person making any outstanding scientific or technical contribution to the national defense or the general welfare.

(m) To make, amend, and rescind appropriate rules and regulations to carry out the purposes of this Act and all the powers and duties vested in the Office, which rules and regulations shall have the force and effect of law.

(n) To avail the Office of the information, services, facilities, officers, and employees of any Federal establishment in carrying out the purposes and provisions of this Act.

(o) To conduct such research and investigation touching upon the use and development of scientific and technical facilities and personnel as the Office may deem necessary and appropriate to carry out the purposes of this Act.

MOBILIZATION OF PERSONNEL

SEC. 5. To mobilize scientific and technical manpower for the prosecution of the war and otherwise to carry out the purposes of this Act—

(a) Section 10 (a) of the Selective Training and Service Act of 1940, as amended, is further amended by adding at the end thereof the following:

"Any provision of this Act to the contrary notwithstanding—

"(1) whenever the Administrator of the Office of Scientific and Technical Mobilization deems it necessary, to carry out the purposes of the Science Mobilization Act, that occupational deferments be granted to persons engaged in any particular scientific or technical occupation or having or receiving any scientific or technical training, he shall certify to the Chairman of the War Manpower Commission that (1) such occupation or training is of a scientific or technical character, and (2) that it is critical in the war effort; and such Chairman shall thereupon approve or disapprove each such certification. In event of such approval, such Administrator shall thereafter determine, subject to such rules, quotas, schedules, and procedures as the Chairman of the War Manpower Commission may prescribe, the facts and circumstances pertinent to the occupational deferment of any person within the scope of such certification and whether any such deferment should be made;

"(2) any determination respecting occupational deferment made by the Administrator of the Office of Scientific and Technical Mobilization in accordance with

Digitized by Google

the authority of this section, as amended, shall be conclusive upon all civilian local boards and any other civilian agencies functioning under this Act."

(b) During the existence of a state of war and for six months thereafter, the Administrator is authorized to prescribe and promulgate appropriate rules, regulations, procedures, and methods, subject to direction by the Chairman of the War Manpower Commission, for the training, classification, and employment of all scientific and technical personnel by any person, agency, or establishment, public or private.

MOBILIZATION OF FACILITIES

SEC. 6. To mobilize scientific and technical facilities for the defense of the United States and otherwise to effectuate the purposes of this Act—

(a) (1) During the existence of a state of war, whenever the Administrator determines, subject to review by the President, that (1) the use of any scientific or technical facility, or of any license, easement, privilege, or other right therein, is needed for the defense of the United States or the prosecution of the war; (2) such need is immediate and impending and such as will not admit of delay or adequate fulfillment by resort to any other source of supply; and (3) all other means of obtaining the use of such facility or of any right therein, upon fair and reasonable terms, for the defense of the United States or the prosecution of the war have been exhausted, he is authorized to requisition such facility and any right therein and to dispose of the same in such manner, not inconsistent with this Act, as he may determine to be necessary for the defense of the United States or the prosecution of the war upon the payment of fair and just compensation for such property to be determined in the same manner as provided in Public Law Numbered 274, Seventy-seventh Congress, as amended, except that the Administrator, subject to review by the President, shall make all determinations in the first instance, respecting fair value of such facility and right: *Provided*, That the requisitioning power herein granted shall not extend to any patent itself but shall be confined to licenses or any other right therein respecting user, together with the right to grant sublicenses.

(2) Whenever the Administrator determines that such facility or any right therein requisitioned pursuant to subsection (1) of this section is no longer needed for the defense of the United States or the prosecution of the war, he shall return the same to the person from whom it was requisitioned if such person desires return of the property or facility, in the same manner as provided respecting returns of requisitioned property in sections 1 and 2 of Public Law Numbered 274, Seventy-seventh Congress, as amended, except that no such return shall be required of the Administrator until six months after the termination of the state of war and that any determination of fair value made in connection with such return shall be made by the Administrator in the first instance, subject to review by the President.

(3) The Administrator shall include in his reports directed to be made under section 11 of this Act a separate part with respect to his operations under this subsection.

(b) During the existence of a state of war, the Administrator is authorized to conduct investigations of and concerning the scientific and technical facilities used or capable of use in war or essential civilian production or supply with the view to ascertaining and evaluating the factors affecting efficiency in such production or supply. The Administrator shall submit to the producers and suppliers concerned, and to all appropriate Federal establishments, his recommendations of any improvements disclosed by his investigations to be necessary or desirable for the national defense or the prosecution of the war.

(c) The Administrator is authorized to represent any agency or establishment before the War Production Board or any other appropriate Federal establishment upon any application for allocation of, and priority ratings for, any critical material and equipment for use in scientific and technical research and development. All such applications shall be made only by and through the Office pursuant to appropriate regulations to be prescribed by the Administrator and approved by the Chairman of the War Production Board.

PROTECTION OF THE PUBLIC INTERESTS IN DISCOVERIES AND DEVELOPMENTS FINANCED BY THE UNITED STATES

SEC. 7. (a) Any provision of law to the contrary notwithstanding, the Office is hereby vested with the exclusive right to use, and with the exclusive right to license others to use, (1) any invention, discovery, patent, or patent right which has heretofore resulted, or shall hereafter result, from research or invention for

Digitized by Google

the carrying on of which the United States or any department, agency, or establishment thereof either has heretofore contributed at any time since the declaration of national emergency on May 27, 1941, or shall hereafter contribute, any money, credit, physical facilities, or personnel; and (2) any invention, discovery, patent, or patent right which is at the time of the enactment of this Act, or shall hereafter become, to any extent the property of the United States or of any department, agency, or establishment thereof.

(b) The Office is authorized, subject to such rules and regulations relating thereto as the Administrator may adopt, to grant to any deparment, agency, or esablishment of the United States a nonexclusive license to use any invention, discovery, patent, or patent right which has been vested in the Office by virtue of the provisions of subsection (a) of this section.

(c) The Office is authorized to grant to others than a department, agency, or establishment of the United States a nonexclusive license to use any invention, discovery, patent, or patent right which has been vested in the Office by virtue of the provisions of subsection (a) of this section upon such terms and conditions, including payment to the Office of a fee or charge for user, as the Administrator may prescribe: *Provided*, (1) That no such license shall be granted unless the Administrator shall first be satisfied and shall find that no monopoly, monopolistic practice, or unfair competitive advantage will be promoted thereby, and (2) that the charge for user prescribed by the Administrator shall either be a uniform nominal fee or a charge graduated to the volume of production resulting from user, or such other scale of charges that shall be necessary or desirable in order to effectuate the purpose of the preceding provisions.

(d) Any owner or assignee of, or any person having an interest in, any invention, discovery, patent, or patent right which has been vested in the Office by virtue of the provisions of subsection (a) of this section shall be paid fair and just compensation for any deprivation of property right resulting from such vesting, to be determined in the same manner as provided in Public Law Numbered 274, Seventy-seventh Congress, as amended, except that the Administrator, subject to review by the President, shall make all determinations in the first instance respecting fair and just compensation: *Provided*, That the Office is also authorized to make suitable compensation, as determined by the Administrator with the approval of the Board, to individual inventors or discoverers or to individuals contributing to inventions or discoveries including employees of the Federal Government, as a reward for their inventions or discoveries or for their contributions thereto when such inventions or discoveries are deemed by the Administrator to be in the national interest and when they are vested in the Office by the provisions of subsection (a) above.

(e) Except as otherwise specifically provided in this Act, neither the Administrator nor any other department, agency, or establishment of the United States shall sell, assign, grant, or otherwise dispose of any invention, discovery, patent, patent right, license, or license right, which has been or shall become vested, acquired, or retained by them or any of them and any transaction or arrangement in violation of this subsection shall be void and of no effect.

(f) The Administrator is hereby authorized and directed (1) to prescribe and promulgate appropriate rules and regulations which shall thereupon have the force and effect of law for the enforcement of the provisions of this section, and (2) to require and incorporate in all licenses, sublicenses, and other instruments and writings made in pursuance of provisions of this Act, such terms and conditions as shall apply the intent and purpose of this section to the facts and circumstances of the particular transaction.

INFORMATION

SEC. 8. (a) It shall be the duty of all persons and establishments, when so requested by or in behalf of the Administrator, to furnish, to the best of their knowledge, any information, data, or record concerning scientific and technical facilities during the existence of a state of war and concerning scientific and technical personnel at all times. Any person or establishment refusing or willfully failing to furnish the same or willfully making any false or fraudulent statement in answer to any such request shall, upon conviction thereof, be fined not more than $5,000 or imprisoned for not more than one year, or both.

(b) The Administrator is hereby directed to maintain the secrecy or restricted character, as the case may be, of any information or data coming into his possession or control under this Act, which is declared to be secret or restricted by other provision of law or the secrecy or restriction of which the Administrator

Digitized by Google

deems otherwise essential to maintain in the public interest. There is hereby established a committee to consist of one member each representing the War Department, the Navy Department, the Office, and any such other Federal establishments as the President may designate which shall advise the Administrator respecting any matter or measure necessary to carry out the purpose of this section.

FUNDS AND FINANCES

SEC. 9. (a) The sum of $200,000,000 is hereby authorized to be appropriated to carry out the provisions and purposes of this Act. Further sums are authorized to be appropriated as may be necessary and proper for the same purposes. Such sums or any part thereof, together with any moneys realized or received by the Administrator from his exercise of any power granted to him by this Act, may be designated and used at his direction as a revolving fund or otherwise to carry out any power so granted.

(b) Further to effectuate the purposes of this Act, the Administrator is authorized, whenever he deems it necessary and expedient, to create or to organize a corporation or corporations as instrumentalities for the more effective exercise and performance of his own powers and duties or those of the Office, or any part thereof. The Administrator may make loans to, or purchase in whole or in part from time to time, the capital stock of any such corporation for any purpose within the powers of the corporation, and on such terms and conditions as the Administrator may determine: *Provided*, That such capital stock shall be purchased and owned only by the Office.

SUBPENAS AND PENALTIES

SEC. 10. For the purposes of any investigations authorized by this Act, the Administrator and any official designated by him may administer oaths and affirmations, subpena witnesses, take evidence, and require the production of books, papers, and other documents which the Administrator or such officer deems to be relevant or material to the inquiry. Such attendance of witnesses and the production of such documentary evidence may be required from any place in the United States or any Territory or possession thereof at any designated place of hearing. In cases of contumacy by, or refusal to obey a subpena served upon any person, the district court for any district in which such person is found, resides, or transacts business, upon application by or on behalf of the Administrator, shall have jurisdiction to issue an order requiring such person to appear and give testimony or to appear and produce documents, or both; and any failure to obey such order of the court may be punished as a contempt thereof. Witnesses subpenaed under this section shall be paid the same fees and mileage as are paid witnesses in the district courts of the United States. No person shall be excused from complying with any requirements under this section because of his privilege against self-incrimination, and the immunity provisions of the Compulsory Testimony Act of February 11, 1893 (U. S. C., 1934 edition, title 49, sec. 46), shall apply with respect to any individual who specifically claims such privilege. Any person who willfully violates any order, rule or regulation promulgated by the Administrator under the authority of this Act shall, upon conviction thereof, be fined not more than $5,000 or imprisoned for not more than one year, or both.

PERIODIC REPORTS

SEC. 11. The Administrator shall render a report in writing to the President and to the Congress in January of each year summarizing the activities of the Office in the calendar year just ended and reporting on the status and progress of science and on scientific and technical problems affecting the public interest together with such recommendations as he may deem appropriate within the purposes of this Act. During a state of war, he shall make interim reports quarterly during each of the months of January, April, July, and October.

SEVERABILITY CLAUSE

SEC. 12. If any clause, sentence, paragraph, or part of this Act shall be adjudged by any court of competent jurisdiction to be invalid, such judgment shall not affect, impair, or invalidate the remainder thereof but shall be confined in its operations to the clause, sentence, paragraph, or part thereof directly involved in the controversy in which such judgment shall have been rendered.

Senator KILGORE. We have invited the members of the Patents Committee of the House of Representatives to be present for the hearings on S. 702. It will probably be impossible for them to attend today because of the debate now going on on the tax bill, but I hope that they will be present at future meetings.

Congressman Wright Patman has introduced a similar resolution in the House of Representatives, and I hope that he will also be able to be present at the future hearings on this bill.

At this time I want to include in the records of this subcommittee the hearings held in the last Congress on S. 2721, which was similar to the present bill in purpose, but which has been amended in accordance with those hearings and the amendments included in S. 702.

The first witness for today is Judge Arnold, who has been summoned.

STATEMENT OF THURMAN ARNOLD, JUDGE OF THE UNITED STATES COURT OF APPEALS AND FORMER ASSISTANT ATTORNEY GENERAL IN CHARGE OF THE ANTITRUST DIVISION

Senator KILGORE. Judge, I want you to identify yourself for the record and then go along in your own way. The committee will be glad to have any information in reference to patents and patent monopoly, and their effect upon the national economy, both in war and in peace, and also any comments you have to make on this bill if you have had an opportunity to read it, and any suggestions you may have tending to improve it because, frankly, that is the purpose of the subcommittee hearings—improvements in the pending legislation.

Judge ARNOLD. Thank you, Mr. Chairman.

I identify myself as judge of the United States Court of Appeals and former Assistant Attorney General in charge of the Antitrust Division.

As judge, I have no information on this bill at all, but in the Antitrust Division we made extensive studies on patents and the patent question. Since I would be disqualified in any event in cases coming before the court with respect to the investigations in the cases which I tried as the head of the Antitrust Division, I see no reason why I cannot give you as extensive a review of my experience as you care to hear.

I think I will first read a short general statement which I have prepared, and then I will go ahead more or less extemporaneously.

Senator KILGORE. For the benefit of the record, may I state that the principal reason that the committee had for summoning you was the fact that while you were head of the Antitrust Division we had summoned you in the rubber investigation conducted by the Defense Investigating Committee, and I felt at that time you indicated you had information in your hands which would make you a very valuable witness on this bill.

Judge ARNOLD. Thank you, Senator. I assumed that I was summoned to testify before this committee because of my experience with the abuse of patent privileges by domestic and international cartels. To sum up that experience, I think it can be said that the evidence is overwhelming that practically all our shortages in basic materials and in chemicals—the very things that are necessary to give us

Digitized by Google

strength in war and wealth in peace—are due to the control of research and invention by domestic and international cartels. If the committee cares to go into detailed hearings, it will find that the production and distribution of such vital products as magnesium, zinc, rubber, aviation gasoline, beryllium, titanium, electrical equipment, plastics, dyestuffs, machine tools, fuels, communications, and a variety of others necessary for both our war effort and our industrial progress have been impeded and delayed, and in some cases totally blocked, because private groups dominated industrial research.

To break that control, to free our economy in the new industrial age which every forward-looking technician believes is coming, as well as to speed up the war effort, we must break up the patent pools which put barriers against independent initiative in research and invention.

But this alone is not enough. The patent itself is only an instrument of aggressive warfare to stop invention by persons not employed by our great cartels. The control of the "know how", the knowledge of results of basic experimentations, is even more important than patents. Out of that control patent monopolies get their start. It is the foundation on which patent pools are built. This bill is designed to break the corner on research and experimentation now enjoyed by private groups.

Of course, private research should be encouraged. But it cannot be expected to turn over to the public the results of research on which it has spent great sums. Their duty to their stockholders compels them to keep a corner on such research if they can. Private research should be encouraged. But only the Government can preserve opportunity for the inventors and technicians who do not choose to work exclusively for the benefit of a private group necessarily trying to get control of the market if it can.

This bill, S. 702, attacks, I think, the root of the evils of patent monopoly. It recognizes what has been an obvious fact for years; that opportunity for invention by independent inventors is the cornerstone of industrial progress. It recognizes that that opportunity has been denied because the funds to develop the talent of our inventors have been forthcoming only from the groups which seek to get a corner on industrial progress. The bill gives the Government authority to promote such research and make it available to the people as a whole, large corporations as well as small, without discrimination or favor.

Inventions are no longer made in garrets by poor people. They are not possible without the wide dissemination of the results of research and experiment so that each new inventor can stand on the shoulders of those who went before him. And so a great industrial bottleneck has been created because experimentation has been possible only for those who have the financial backing of great corporations. This industrial bottleneck has become narrower and narrower during the past 20 years until the independent inventor for want of a laboratory in which to test his ideas has gone the way of the buffalo. This bill for the first time gives that laboratory to the inventors of the Nation who are not employed by the cartels.

Parenthetically, Senator, I would like to say that my memory of the T. N. E. C. hearings is that you will find that the decline of small

Digitized by Google

business enterprises in this country closely parallels the concentration of industrial research. I do not have the exact pages in mind, but I think you will find it if you study the T. N. E. C. report.

Industrial research is the most vital kind of education we have. Research must be free to the public if it is to accomplish its purpose. Through inertia and ignorance of what was going on we have permitted the control of the industrial education of our technicians to fall into the hands of cartel groups. We have assumed that the state could not afford to subsidize this kind of education. By this neglect of what I think is a vital function of government we have created a situation where the best inventive brains of our country are compelled to work for salaries paid by corporations that can have no interest in giving to others the fruits of their research.

Cartels have not tried to suppress experimentation. They have tried only to corner it. They have kept the savings of new techniques for themselves instead of passing them on to consumers. This has been going on for years and we have just waked up to it. It was not until 1939 that prosecutions and senatorial investigations began to uncover the patent cartels in all the necessities of life. The great synthetic rubber and gasoline patent cartel was formed back in 1929. That cartel was holding back the production of rubber until it could get the new product completely under its control. It was hiding its techniques during the preliminary stages even from the Army and Navy. Had this bill been in effect before the war the Army and Navy would have been as far advanced in the technique of rubber as is Standard Oil. That knowledge would have been spread to the independent industries that were trying in vain to get licenses under Standard Oil domination. The operation of the rubber cartel was not discovered until 1942. Today millions of citizens lack transportation, and the war effort is slowed down, because this cartel had a corner on the technique and the research in rubber.

This bill attacks the fundamental bottleneck by spreading knowledge of modern experimentation and the free use of the results of that experimentation to every competing industry. To allow the conditions which created our patent cartels to continue during and after the war would be the same kind of tragedy as if we permitted private groups to dominate engineering education or even liberal education.

There will be pressure against this bill by great industrial organizations whose control is threatened by the new enterprise and the new initiative which will be liberated by the opportunities which the bill creates.

But I know of no bill before Congress which is so important, not only to promote technical development during the war but also to further industrial development after the war.

Today vast sums are being spent in research and technical development of our national productive plant. Necessarily most of the money is spent with the very corporations whose business policy is to control the market through patents. Such a business policy compels these groups to hold back new inventions until they have received their money from obsolete equipment. It compels them to tie up their inventors with contracts which prevent wide use of new techniques. The bill prevents this domination from being perpetuated after the war at the expense of the taxpayer during the war. It frees

Digitized by Google

industrial progress from private domination of research and experimentation after the war.

Now I am going to give you some brief and, I think, familiar examples of the suppression of research from competing industry and from the public. They are all found in various hearings at which I have testified and in articles which I have written, but I think it may be useful to have a few of them in this record.

I think one of the most amusing ones, not economically important but a perfect illustration of the kind of attitude which the corner on research creates in those who have it, is in a document which was introduced before the Bone committee. It is a memorandum from the files of the General Electric Co., and concerns flashlight bulbs. I will read it into the record.

I quote:

Two or three years ago we proposed a reduction in the life of flashlight lamps from the old basis on which one lamp was supposed to outlast three batteries, to a point where the life of the lamp and the life of the battery under service conditions would be approximately equal. Some time ago, the battery manufacturers went part way with us on this and accepted lamps of two-battery lives instead of three. This has worked out very satisfactorily.

We have been continuing our studies and efforts to bring about the use of one-battery-life lamps. I think you will be interested in the attached analysis which Messrs. Prideaux and Egeler have worked up covering the various points involved in going to the one-battery-life basis. If this were done, we estimate it would result in increasing our flashlight business approximately 60 percent. We can see no logical reason either from our standpoint or that of the battery manufacturer why such a change should not be made at this time.

Messrs. Parker and Johnson now have this matter up with the battery manufacturers and I would urge that every assistance be given them to put it over.

Senator KILGORE. The purpose was to shorten the life of the flashlight bulbs and thereby increase the sales of the product?

Judge ARNOLD. Yes. Now, I am not going to start throwing bricks at somebody who wants to increase the profits of his corporation, but I am pointing out that you cannot expect private business to formulate policies except to profit themselves. I have never felt that this thing was cured by denunciation of these corporations. Obviously their every interest is for their own share of the profits. The answer is your bill, because I don't suppose that the public knew anything about flashlight bulbs. There wasn't any way that they could find out about them.

That is a minor example but it is a perfect illustration of a familiar human attitude. When you turn to something vastly more important, fluorescent lighting, you see these same influences.

I will quote several more documents from the Bone committee, because they are illustrative of how, in order to preserve obsolete equipment and get the money out of obsolete equipment, technological advance is held back.

This is a letter from Howard M. Sharp, manager of the lighting bureau of the Buffalo, Niagara & Eastern Power Corporation of Buffalo, to Mr. Ward Harrison, of the General Electric Co. It is signed by Mr. Sharp as manager of the lighting bureau of that company, and it reads as follows:

DEAR WARD: Increasingly I seem to become the "father confessor" on fluorescent lighting as far as the utility men are concerned. This concerns one of the displays dealing with fluorescent lighting in your G. E. building at the New York

Digitized by Google

World's Fair. I must confess that although I have been in your exhibit twice I did not see this particular display.

It appears that 20 watts of fluorescent lighting are compared with 20 watts of incandescent lighting, the sign purporting to read something to the effect "See the difference between equal wattages of fluorescent and mazda lighting." Of course, the readings on the foot candle meters show dramatic differences.

If this demonstration is as explained to us, I think it does violate the spirit of the understanding that our group had in Cleveland. As a matter of fact, I would think it violated the fundamental concept of the lamp department that advances in the lighting are should not be at the expense of wattage, but should give the customer more for the same money. I hope you can find a way to change this exhibit, so that it does not give misleading impressions to the crowd who will see it.

And here is the answer:

When Miss Winters showed me the attached letter from Howard Sharp I immediately got in touch with Al Reas with regard to the demonstration at the fair. Apparently this particular demonstration was temporarily loaned for use at the fair and is now being returned to the exhibit shop. Therefore, by removing this particular exhibit, Sharp and the other utility men need have nothing to worry about.

Now there, Mr. Chairman, is a thing which runs through American business. Wherever you see patent control developing new techniques which will create financial dislocations if they are put on the market and impair the value of old techniques, you see the new technique stopped.

Senator KILGORE. The purpose of that was to keep the public from seeing that the average cost of lighting by fluorescent methods is cheaper than lighting by mazda methods?

Judge ARNOLD. That is right. The Antitrust Division has brought a suit against General Electric and others charging a conspiracy to control fluorescent lighting. That suit has been postponed until after the war, at the direction of the Secretaries of War and Navy.

The reasons I attribute for this conspiracy are first that fluorescent lighting burns less electricity, and therefore the utilities did not like it, and, secondly, that it makes obsolete the mazda lamp, and therefore the General Electric Co. did not like it.

Had your bill been passed at that time, we would not be so short of industrial lighting today. It is obvious that a Government bureau or a Government authority investigating fluorescent lighting would have discovered this thing at once.

I do not expect industry to act against its own interests. Therefore this is the kind of situation which makes competing Government research essential to progress.

Senator KILGORE. The saving of wattage would have been a saving to the public, but not only that, it would have given us more electricity to use during the war by reducing the load for domestic and lighting purposes?

Judge ARNOLD. That is right. We are so short of fluorescent lighting today that civilian supplies have been cut off, and there is nothing more important in the war effort than electrical equipment.

The point is that while the Antitrust Division can investigate and prosecute cases of this kind such prosecutions are after the suppression has occurred. Had your bill been law, I do not think that this suppression of fluorescent lighting could have occurred, because electricity would certainly have been one of the things the research agency set up by the bill would be investigating.

Digitized by Google

Now I offer for the record a condensed statement of the whole fluorescent suppression, which was introduced before the Bone committee. If you want to reprint it, all right; if not, it can be used just for reference.

(The material referred to was marked "Exhibit No. 2" and appears on p. 28.)

Judge ARNOLD. The Standard Oil rubber is another and very familiar example. Standard Oil entered into a patent cartel with the German Dye Trust. Standard Oil was afraid of competition from synthetic gasoline, so they wanted to get control through the use of patents of synthetic gasoline, and the German Dye Trust wanted to control synthetic rubber, and so they split that control with Germany, and I think that the result is known to everyone.

Here is how the thing worked. The Dow Chemical and the Goodyear Rubber Co. wanted to develop synthetic rubber in 1938. Had they been allowed to do so, no one can estimate the progress that would have been made, because there was no shortage of critical materials at that time. Standard Oil refused to give them patent licenses except on terms which prevented development.

The secret reason was given in a letter by Mr. Frank A. Howard, vice president of Standard Oil, which was that Germany did not want development in the United States.

I quote from this letter:

The thing that is really holding us up, however, is not the lack of a plan either from Goodyear or ourselves, but the inability of our partners to obtain permission of their Government to proceed with the development in the United States.

Standard Oil was sorry about this——

Senator KILGORE (interposing). Their partners were the I. G. Farben industries of Germany?

Judge ARNOLD. That is right.

Senator KILGORE. And I. G. Farben could not act without authority from the German Government?

Judge ARNOLD. That is right. And the German Government did not want I. G. Farben to develop this.

As I said, Standard Oil was sorry. I will read a memorandum of 1938 written by their executive committee:

Mr. Howard deplored the fact that the German Government's restrictions on I. G.'s [The German Dye Trust] freedom of action have prevented our [Standard] making material progress in the American field, particularly as there is some indication that the American rubber companies are making independent progress.

Nevertheless, they sympathized with Germany and decided to abide with the restrictions which Germany imposed. I quote again from another letter from Howard in 1938:

Until we have this permission, [from Germany] however, there is absolutely nothing we can do and we must be especially careful not to make any move whatever, even on a purely informal, personal, or friendly basis, without the consent of our friends. We know some of the difficulties they have, both from business complications and interrelation with the rubber and chemical trades in the United States and from a national standpoint in Germany, but we do not know the whole situation, and since under the agreement they have full control over the exploitation of this process, the only thing we can do is to continue to press for authority to act, but in the meantime loyally preserve the restrictions they have put on us.

Digitized by Google

That was their foreign policy with Germany. Their domestic policy was, of course, to maintain control.

For instance, on February 1, 1940, even after the defense emergency was actually realized, the Standard Oil document with reference to buna rubber reads as follows:

A high royalty rate (7.5 cents lb.) is fixed so as to make the operation practical for the rubber company only so long as the product is used as a relatively high cost specialty.

The only point in rehearsing this—which is familiar to everyone—is, I think, that if we are really going to clean up that situation, it is easier to do it by spreading the information and research about synthetic rubber than a great series of prosecutions afterwards. This thing could have been prevented.

Now, what happened when the rubber crisis was on us? You all know. There was not anybody in the Government who had the research, who could tell which experts were sound and which experts were unsound. The Government did the best they could. They formed one group to handle the thing, and then they had to form another group—they did not have the background to tackle that problem, and it was a long time even after the whole thing was discovered before it was straightened out.

The absurdity of the Government not having that information and having to go to the very people who are interested on the one side or the other for information on the patents is demonstrated by our rubber experience. When government reaches out into industry for expert advice, without a technically trained group of its own it receives nothing but contradictory claims and it does not have the research and the experimentation to determine which is sound and which is unsound.

I offer a short statement of the Standard Oil story.

(The material referred to was marked "Exhibit No. 3" and appears on p. 47.)

Judge ARNOLD. The whole story is already before the Truman committee.

Senator KILGORE. Yes.

Judge ARNOLD. Plastics are another example of the necessity of the research and experimentation by the Government which your bill provides. For your use if you need it, I introduce the testimony given by the Antitrust Division before the Senate Patents Committee.

(The material referred to was marked "Exhibit No. 4" and appears on p. 49.)

Judge ARNOLD. In plastics, even after the patent situation was cleared up, the question of the "know-how" came up. One of the companies whom we were investigating and were about to indict came in and offered to turn loose all of its patents and we said, "Well, why are you so generous?" And the head of the company said, "It won't do you any good; nobody can find out how to use them unless they come to see us." Which was true.

We then demanded that the information, the "know-how" be made free to the public in order to remedy what we claimed was a violation of the antitrust law. This was in connection with a suit against Roehm & Haas which is still pending.

Digitized by Google

I won't discuss the abstract question of whether an industrial concern should be compelled to furnish the "know-how" to other people. I only point out this, that if they are compelled to do so reluctantly, it is going to be very difficult to get it, and the short and easy answer is Government experimentation and Government education to bring the results of this tremendous scientific progress to industry as a whole.

I think I will introduce here a quotation from "Industrial Research and Changing Technology." It is on pages 45 and 46 of the report of the National Research Project on Reemployment Opportunities and Recent Changes in Industrial Techniques.

That report says:

According to the evidence presented, 13 companies employed one-third of the industrial-research personnel reported for 1938: 140 companies, representing less than 10 percent of the number reporting, employed two-thirds of the workers. The remaining third was employed by 1,582 concerns. About 150,000 industrial corporations were without research laboratories. In 9 leading industries one-fourth of those companies which operated laboratories employed between 55 and 90 percent of the research workers in the respective industries.

Now, that situation puts the domination of technical improvement in a very narrow bottleneck indeed.

Senator KILGORE. May I ask you a question at this point? From your experience, what do you believe is the basis of industrial monopoly as it now exists in the world?

Judge ARNOLD. Unquestionably, the domination of research techniques with and without patents. If the Antitrust Act were being passed today, it would not be called the antitrust law, but it would be called the "antipatent law". The trusts were the thing which was uppermost in monopoly control then as patents are now.

However, I don't think we should forget that the patent itself is merely the spearhead of monopoly domination. If you are going to attack the root of the problem, you must get a dissemination of research to the public. I think it is more important today than any other form of education. It is an educational function which the state owes to its technicians.

The effect of turning this thing loose through Government subsidies and research is shown by the war. Look at rubber. I suppose there are literally 50 known ways of making rubber, all of which are, at least to some extent, practicable, and yet in 1938 nobody had any idea whether it could be made at all.

Senator KILGORE. Recently on a visit to one of our new rubber plants—I believe it was United States Rubber, it was a polymerization plant—the management informed a subcommittee of which I was a member that the company, once the "know-how" and the right to use it, had been able to increase the production of a built plant 30 percent in 2 weeks of experimentation on their polymerization process by being able to run the stuff through the tanks faster. They were practical rubber people and they were able to use the "know-how" which they obtained from the Standard laboratory to push up the production 30 percent.

Judge ARNOLD. We have been accustomed to think of the power to restrict production as wealth. For instance, you have a research laboratory and power to limit anybody else from using that knowl-

Digitized by Google

edge. You sell stock in this power to restrict production, and then claim that anyone who wants to free the industry is taking away corporate property. The fundamental thing that was back of our 9,000,000 unemployed—idle capital and idle labor—was the fact that we have put money values on the power to restrict production, and have assumed that turning industry free was regimentation.

I made a little list, Senator, of the objections I have heard to this bill. And, incidentally, one of the first is that this bill regiments industry.

Senator KILGORE. I would like to get your reaction to that.

Judge ARNOLD. Well, I have heard that the regimentation of industry is supposed to come because your bill does not give the patents to the people who are employed by the Administrator. The charge is that the inventor's incentive is therefore taken away. I think I am safe in making the statement that the formal agreements in every single industrial corporation compel the inventor to sell his patent for $1 or some equally nominal amount.

Senator KILGORE. We were informed by representatives of the Army that in all of the research now being done at the expense of the United States Government in the various leased laboratories by the various corporations, the scientists are still operating under contracts with the laboratories which automatically give the laboratory or the corporation all patents by assignment. Is that correct?

Judge ARNOLD. Yes.

Senator KILGORE. That is, developments are being made at Government expense for an exclusive monopolistic patent after the war is over?

Judge ARNOLD. That is right. While we did not survey all the industries in the United States while I was in the Antitrust Division, I don't think we found a single contract in which the inventor got his patent.

Senator KILGORE. What would he get in lieu of it?

Judge ARNOLD. He would get $1 from the big corporations and $25 from the little ones. It was a nominal consideration, anyway.

Senator KILGORE. This bill provides that the inventor can be paid by the Director a reasonable value for the idea that he has developed. I think that is much better than the $1 or the $25 or the $45 which an inventor now gets, and would constitute more of an incentive.

Judge ARNOLD. I will say that thet large corporations did give bonuses for extra work. We did not find that. But the point is that the inventor's incentive was not the right to get a patent—the patents belonged to the corporation.

So much for the regimentation and the lack of incentive for the inventor—that argument against the bill is complete nonsense.

The next objection is that it puts science in a straitjacket—on the theory that if the Government starts any sort of research it will in some way impinge upon science.

I think probably the best answer to that is the magnificent work done by the Department of Agriculture. The reason that we have such magnificent Government research in agriculture and not in business is that the farmers never were organized, and so the big farmers did not attempt to get control of research development and research techniques. I think you should probably get a Department of Agriculture expert to testify on what they have done. It is simply start-

Digitized by Google

ling. And the benefit has been to the entire people instead of to a small privileged group.

The reason the Nation got that benefit from agricultural research is that we were not dealing with a cartelized industry in the first place. There were no special-privilege groups to claim that governmental research in agriculture was regimentation.

Senator KILGORE. Agricultural research was stimulated by the Government's activities, rather than put in a straitjacket?

Judge ARNOLD. It was. Not only was it stimulated, but private patents—mind you, this bill in no way interferes with private research—private patents on corn and seed and everything else multiplied. The private inventor could go to the Department of Agriculture and get all the information that was available from all of their research, and stand on their shoulders and get his own patents. So the Government research did not interfere with private research at all—rather it encouraged the private inventor. They are not called inventors in agriculture, but they really are. It did not restrict private initiative or stop the private inventor from getting patents.

Dr. SCHIMMEL. Would the development of hybrid corn be an example of what you are speaking of now?

Judge ARNOLD. Yes. There are a number of patents on hybrid corn. I believe orchids are patented. Roses are patented.

Senator KILGORE. Judge, I have here a clipping from the Washington Times-Herald, I think it is, under date of March 14, in which one Dr. Gustav Egloff, of Chicago, attacks the bill as totalitarian. Do you know who he is?

Judge ARNOLD. He is the research director of the Universal Oil Products Co., controlled by Shell and Texas. It is part of the C. R. A., which is the Catalytic Research Association. Among the members of the C. R. A. are Standard Oil of Indiana, Standard Oil of New Jersey, Shell, Texas, Kellogg, and, up until the war, I. G. Farben Industries of Germany.

Senator KILGORE. He is listed here as president of the American Institute of Chemists and spoke as such. That organization, of course, is the owner of a lot of exclusive patents?

Judge ARNOLD. That organization is a patent licensing organization. If I am not mistaken, they manufacture nothing. Of course I do not wish to impugn Dr. Egloff's sincerity—if I were the head of an organization which was dependent for its monopoly position upon keeping research from the public, I would think that anybody who interfered with that was a totalitarian. You see, these fellows get the idea, and perhaps I would myself if I had a patent pool—I don't happen to have any—that a patent pool is property. Now when the Government starts disseminating information it destroys the value of the exclusive information controlled by the pool. And therefore it takes away property. And the totalitarian states take away property. And therefore the bill is totalitarian. They are very sincere about it. They work themselves up into a high state of rage. They pound the table. But back of the whole thing is this: The bill will interfere with their special privileges.

In other words, if Dr. Egloff—if the Universal Oil Products Co.—should come and testify for this bill, I would look through the bill for a joker. And I say that without impugning their sincerity at

Digitized by Google

all. No doubt they would consider that they were acting in all sincerity.

Senator KILGORE. Judge, in reading this bill, have you found anything that interferes in the least with the patent rights of an individual or of a corporation to go ahead and develop an idea of their own—except that in time of national emergency the Government may require them to relinquish the "know-how" and pay them for it for use to protect the Government?

Judge ARNOLD. No, sir. There is not the slightest——

Senator KILGORE (interposing). These companies can go ahead operating under this bill on the patents they actually own without any trouble? It simply puts competitors into the field?

Judge ARNOLD. It allows thousands of individuals and small corporations to get into the picture. The large corporations will really have to put their research laboratories on their toes. And if these research laboratories are as good as I think they are, they will utilize the information which the Government experiments give them and go ahead at an increased pace. That is the only effect that it is going to have.

The only "property" it is going to take away is the corners on research which these people have.

The interesting thing is that these corners on research have happened only in industry, where they started out with a cartelized structure. Nobody has even suggested that the agricultural experimentation is totalitarian—that it takes away property.

Dr. SCHIMMEL. I gather from your statements that one of the most important purposes of industrial research now is to corner developments and to maintain them to create a monopolistic position?

Judge ARNOLD. I would put it more charitably than that. A great corporation builds up a research laboratory. This is not a question of ill will, but they have to make profits—they have dividends that have to be paid. I suppose if you were the head of that corporation, and spent that money, and then turned the information loose to the public or to your competitors, you would not be president or a director very long. It is inherent in the situation that they must attempt to maintain a corner. And I have no objection to their doing it, if at the same time there is some public agency which is investigating for the benefit of the smaller businessman.

Dr. SCHIMMEL. But isn't there a danger there that the big companies will stop encouraging any research if its monopolistic value is curtailed?

Judge ARNOLD. Quite the contrary. Not only will they not do that, but they will be compelled to move faster. A company gets big because it moves ahead of its competitors. Now, let us make the race fast enough so that these fellows will really run.

Edsel Ford, testifying in the T. N. E. C. hearings, said the reason that the Ford Motor Co. grew was that, "We kept ahead." The declining company is the one which gets itself into the position where it does not have to get ahead of its competitors. And then what does it do? It suppresses fluorescent lighting in order to pay off on obsolete equipment. Research turns around and goes the other way, because you have a situation where the financial reward lies in that direction.

I don't think that we should blame these companies for trying to

Digitized by Google

make money. I believe we should blame the Government for creating a situation where more money can be made by dominating a field and suppressing research than by keeping ahead of the other people.

Senator KILGORE. Last night I was told by the head of one of our biggest corporations that if by an act of God every plant they had and every piece of equipment and every record were all destroyed, but if they kept their research, their technical, supervisory, and administrative personnel as a unit, that it was his firm belief that he could raise enough money to rebuild the plant; but if they lost their personnel, regardless of the organization, he did not believe that they could operate the plant; the "know-how" in that outfit is worth more than all the equipment.

Judge ARNOLD. Of course, there is a school of what I call the security economists, with banker psychology, which says that unless feather beds are put under all of our industrial concerns so that they cannot lose money—so that they are not threatened by more efficient people coming up—they will disappear from business. Well, if I thought that of American business I would be very discouraged. But actually, as the war has shown, there is bubbling up all over America the most tremendous outburst of energy and ability. It is not true that American business needs a feather bed.

Senator KILGORE. Have you ever found that there is any feather bed under what we call small business?

Judge ARNOLD. Oh, no; that is supposed to be a "way of life" and not business—like farming.

Now, you suggested that I might criticize the bill, and I do have one objection to it. That is, while it may be implicit in the bill, it is not expressly set out that the Government should protect its licensees against what I call the patent blitzkrieg. I am going to introduce into the record one of our cases where we collected fines—a short case history to show what happens to small business when you permit them to be subjected to the expensive litigation which a large business can put on them, even though, as I will show a little later, of these patents that are taken out by American industry, probably only about 1 in 10 is valid. The only thing that keeps them good is the fact that they are able to throw the small businessman into years of litigation.

Here is this case history from the building industry, which is one of our most backward industries. It concerns the manufacture of air filters, which, incidentally, are today very much needed in national defense.

In 1924, the manufacture of air filters was in its infancy. In December of that year, an American patent was issued to a German citizen. It was a shaky patent, and it is a curious fact that the same device was declared invalid in Germany because of lack of invention. Company A got hold of this patent. Incidentally, I would like to put the indictment in the record. I am using letters of the alphabet to designate the different companies, rather than their real names.

As I said, company A got hold of this patent. It got together with company B who had another patent on air filters, and out of this came company C, a patent-holding company. Company C acquired two of its competitors, D and E. It was then big enough to begin the infringement-suit racket. The result was that under duress it absorbed companies F, G, H, I, J, and K.

Digitized by Google

Of course it did not take over all the outsiders. Company L was a little fellow not strong enough to defend an infringement suit and it was, therefore, ruthlessly destroyed.

These astounding results, based on an all-out patent offensive, were brought about despite the fact that the officials of company A were strongly of the opinion that the principal patent was invalid all the time. All in all, this patent pool acquired 105 patents. The only suit ever tried ended in a declaration that the particular patent was worthless. Most of the patents were never tested. The very purpose of such schemes is to avoid court tests. Finally, out of 16 competing manufacturers in 1925, all of them except 2 were either crushed or brought into the ring.

Recently these air-filter companies were indicted. They paid $88,000 fines, but they still have their patents which are today susceptible of being used again in the same way.

Now, let us assume that the Government is interested in air filters. Assume that the Government will license and protect these little companies against these patent schemes—this bill will have the effect of cleaning out these tens of thousands of patent combinations which now handicap industry because the validity of the patents never comes before a court.

If you can put into this bill a provision, very easily drawn, compelling the Department of Justice to defend the rights of licensees against infringement suits, I can assure you that not very many infringement suits will ever be brought. The small man needs that protection. I don't think you can call it the fault of the Patent Office, but, for instance, there are about 60,000 patents issued every year by the Patent Office. I had somewhere the figures of the tremendous number of patents which the individual Patent Office employee had to pass on. When application for patents flood the Patent Office they of course cannot keep up with them, and there is simply no way of preventing these patents from being issued.

Now, think of those 60,000 patents a year, and let us look for a moment at the patent policies which compel the applications to be made. I will take a patent policy which was brought out in the Hartford Empire suit. Here was the patent policy of Hartford Empire—I will quote it:

> (*a*) To cover the actual machines which we are putting out, and prevent duplication of them. * * *
> (*b*) To block the development of machines which might be constructed by others for the same purpose as our machines, using alternative means.
> (*c*) To secure patents on possible improvements of competing machines, so as to "fence in" those and prevent their reaching an improved state. * * *

Here was a patent policy aimed at blocking invention and preventing patents of others from reaching an improved state.

That is typical. Of course, that is not put on the application that goes to the Patent Office. And the Patent Office issues 60,000 patents every year.

Such patents could not even be applied for, in my opinion, if the Government had facilities for research and offered protection to its licensees. And so I think that it would clean up the existing patent muddle.

Dr. SCHIMMEL. In your study of fluorescent lighting, did you find that the whole development was held up a number of years?

Digitized by Google

Judge ARNOLD. Oh, yes.

Dr. SCHIMMEL. Even though they held up this development for years, didn't they at the same time do enough research so that if anybody else developed it, they would be able to come in with a patent infringement suit?

Judge ARNOLD. They now are. Even at the time that they were suggesting that their efforts in the war effort were so great that they could not indulge in any litigation at all, they were suing the Hygrade Sylvania in New York City to keep Hygrade Sylvania from making electrical equipment. So they were actually using this patent pool during the war to stop the development by others, while the antitrust suit was being continued.

Senator KILGORE. They said they did not have the time to defend, but they had plenty of time to attack.

Judge ARNOLD. That is right. They were expending all their energies on attacking and they did not have enough energy to defend. Of course, that is the policy. And the smaller fellow—Hygrade is a small company, but it is strong enough to defend that suit—the smaller fellow is usually put out of business.

If you care to subpena the Department of Justice records, or if you go through the Bone committee's file, you will find it make abundantly clear that not even the industry itself believes in these blocking and fencing patents.

For instance, we indicted Wayne Pump. The indictment was dismissed because of certain technical defects, but they were reindicted. They had patented the idea of a pump that computed the price of the gasoline sold. Of course, if you can get a patent on an idea you can control the industry.

I will read you a typical example of the many statements which the Department of Justice has on patent policy. In answer to a rather naive inquiry from one of the members of his staff, Mr. C. L. Bausch, of the Bausch & Lomb Optical Co., told why the company continued to pay royalties on worthless patents. He wrote:

> A great many of the patents that we are operating under are very weak and if we wished to, we could break them outselves and not pay royalties, but good business judgment, I believe, justifies the idea of paying royalties even on weak patents in order to maintain a price control picture that is helpful.

Here is another memorandum from Mr. Bausch. This, of course, is the optical cartel which practically stifled the development of military optical goods in this country. He wrote in September 1938:

> Of our sales in 1937 about half of the products sold were protected by patents, roughly $5,000,000 on which we paid an average of 5 percent royalty, $250,000 to outside sources for protection on our product and for buying the means of accomplishing price control. A great deal of money, but apparently justified by the figures in most cases.

Thirty-four million people in the United States need spectacles and cannot buy them because of the controlled price of spectacles. In the *Univis case* they had what I call an umbrella patent. The thing that they had invented was the position of the segment. It was very difficult for us to see any invention in that, but we were prosecuting them under the antitrust law, and the question did not arise. The thing that they had patented was the spectacles themselves. By getting a patent on the spectacles which contained this invention, they got control of the grinding, and the polishing, and all such unpatented arts. The

Digitized by Google

Supreme Court held that that was an illegal device and in violation of the antitrust law, but the point is that Government research and Government licensing would have made that cartel impossible from the beginning. It would not be a question of the Antitrust Division spending hundreds of thousands of dollars and going through these very difficult dissolution suits and years of investigation. The thing could not even start if Government research existed.

Senator KILGORE. Is that monopoly the basic reason for the fixation of prices by localities? I know that in one city you could get a pair of glasses for $15, but if you went to another the identical pair would be $20. Some place else they would be $25.

Judge ARNOLD. In Washington you can get them as low as $7.50. This is how they do it. The Ideal Optical Co. in 1938 announced spectacles for $7.50, just half of the prevailing Washington price. The spectacles were all right—I am wearing a pair of them now—because, of course, these are not expensive articles. And immediately their supply was cut off.

Senator KILGORE. But you might have a compound lens in one, you may have a more expensive lens.

Judge ARNOLD. The same is true of the compound lens. The Ful-Vue was a compound lens and the Univis was a compound lens.

Senator KILGORE. When you mention spectacles you mean the lenses themselves?

Judge ARNOLD. No; the whole thing is controlled. There are patents on the frame, and there are patents on the lenses, there are patents—well, let me read you a document from M. J. Root, of Shur-On, which is a member of the spectacle cartel. Here is the statement of patent policy. He wrote to a Shur-On employee as follows:

Frankly, the Ful-Vue patents are so weak that they are a tremendous task to uphold, because the American Optical Co. cannot be too severe in its tactics in keeping the licensees in line, because if they were forced to bring suit, the patents might be knocked out and the whole Ful-Vue license system would topple, and Ful-Vue and Hi Bo products could then be made by anybody at any price, and the nice margin of profit in this business would be lost.

That gives you the idea.

In other words, the Ideal Optical Co. is told that they cannot get supplies. And how much money can the Ideal Optical Co. spend in forcing those people to give them supplies, by suits for damages and all that sort of thing? And that is the picture.

I will give you one more example for the record. This is from the T. N. E. C. hearings, and concerns the Hartford Empire patent pool [reading]:

The Amsler Morton Co. has been manufacturing glass machinery ever since 1915. In 1934 it was told to stop or to sell out for what it considered an adequate price. Litigation commenced. Its customers were circularized advising them of the dangers of buying from the company. An infringement suit was begun against a customer named Swindell. I quote from the testimony of the treasurer of Amsler Morton:

"Q. Can you tell me how much the Swindell litigation cost your company?

"A. Well, it was tremendous for a small concern.

"Q. How much was it?

"A. It amounted to close to $50,000, and that doesn't take into consideration the expense of our organization.

* * * * * * *

"Q. I would like to ask you this: You told us, I believe, that you have sold only one lehr so far this year?

Digitized by Google

"A. That is correct.

"Q. That you sold no lehrs last year. What would you say the value of the glass-manufacturing machinery business is now? That is, your business.

"A. I will give you a comparison. In '28 we were doing $800,000 worth of business and last year we had $18,000 worth of business in the glass industry—quite a drop."

Their business dropped from $800,000 to $18,000 while the litigation was going on.

Just take that with the air-filter case. And take another example which I think might be useful, the *Masonite case*, which we won in the Supreme Court. There there was a number of hard-board manufacturers. The two leading ones got together. One of the favorite devices is a settlement of litigation. Here is the settlement of litigation device: A patent pool is of doubtful validity, so we do not form a patent pool, but I will sue you and then we settle the litigation and now we are together. In the *Masonite case*, at the end of the operations of that pool, there was only one Masonite hard-board manufacturer in the United States.

And there is a patent, curiously enough, on the use of anything in making hard board. One of the Justices of the Supreme Court in the argument of that case said, "Do you mean to say that under your patent you could prevent them from using sugarcane in making hard board?"

And they said, "Yes; it is a patent on any form, an idea patent."

The record shows that they did not believe in it very strongly, but that is not necessary in conducting the patent blitzkrieg.

Now, let us take that *Masonite case*. I think that it is an idea patent, and I don't believe it will be sustained on all materials. If the Government, operating under this bill, develops competing methods of making hard board, and will defend its licensees, you will keep that Masonite monopoly from dominating this new technique.

I would earnestly suggest that that sort of an amendment be made, and it will be very simple—just that the Government is directed to protect its licensees.

Now, I think we can take a leaf to some extent out of Germany's development of drugs. I was told by the head of Imperial Chemicals that the German ascendancy of drugs arose from the fact that they could not get any private industry in England interested in drugs. The fundamental invention that made I. G. Farben great was the product of an Englishman's brain. He could do nothing with it in England, and so he went over to Germany. The thing we need not take out of Germany's book is that Germany entered into a cartel between the company and the Government.

Senator KILGORE. In other words, they use cartels frequently in lieu of diplomacy?

Judge ARNOLD. Well, that is the essence of fascism—a complete partnership between Government and monopolies. But the point is that they subsidized research, and that is what made them strong. And, in turn, failure to conduct sufficient research was what handicapped the democracies.

Now, as to the international aspects of this, and I think this bill does have international aspects: I don't know what is going to happen after the war, but I would like to read from a pamphlet entitled, "A National Policy for Industry."

Digitized by Google

(The pamphlet referred to was marked "Exhibit No. 5" and appears on p. 80.)

Judge ARNOLD. The signatories are about 120 of the leading British businessmen. They include Lord McGowan and Lord Melchett of the Imperial Chemical cartel, and these people quite sincerely say as follows:

> Where similar products are manufactured in different countries, these international agreements (which necessarily imply that the parties to them are able to speak for the major share of the industry concerned) are essential to keep production equitably allocated between countries and companies, in tune with the maximum world demand attainable. They exercise a stabilizing influence against violent fluctuations and dislocating shifts of the currents of trade and thus have an essential part to play in post-war reconstruction, when international economic cooperation for the general benefit will be of the highest importance.

In other words, here is a substantial group which sees no salvation for the world outside of the operation of international cartels. I do not think we need concern ourselves with British policy. If they choose to form international cartels, that is all right, but the point is that now more than ever do we need to encourage our own research so that this development of products and this exchange of information between countries is not exclusively cornered by these international cartels. Let us hope they do a lot of research, but there is no good reason why we should delegate the entire power over research to these international groups.

Senator WALLGREN. I wonder if you have any further recommendations on this bill?

Judge ARNOLD. I read it, and it seems to me that that is the only recommendation I would make with respect to substance. I did not read it with the idea of evaluating technical details, because I think my testimony is of value only with respect to the monopoly aspects.

Senator WALLGREN. You are so thoroughly acquainted with all of these unfair practices, I wonder if you could inject something here which would help to straighten out this matter.

Judge ARNOLD. The whole problem is simple; it is just the problem of public education in industrial progress. The bill can be very simple, and I think this bill is.

Senator KILGORE. And the stimulation of competition?

Judge ARNOLD. That will necessarily follow.

Senator KILGORE. In other words, furnishing to the American businessman the same service that the Department of Agriculture furnishes to the American farmer?

Judge ARNOLD. That is right.

Senator WALLGREN. You do think this provision to protect licensees is very important?

Judge ARNOLD. Very important, because I can show you hundreds of instances of the patent blitzkrieg. I gave you only two, but there are hundreds. Of course, if the Government licenses somebody and then tells him to protect himself, he cannot stand the litigation expense.

Senator KILGORE. The theory there would be that we protect him somewhat like we do in wartime when we infringe on patents by the Government defending the suit?

Judge ARNOLD. That is right. Simply an addition to the provision in the bill licensing these patents to anyone. The Government, I think, should defend its position. For instance, the Govern-

Digitized by Google

ment might distribute the results of some of its research without trying to take out a patent because in its opinion it was not something on which a patent should be taken. And in that case the Government should protect the user from an infringement suit. If, on the other hand, they thought it was a patentable article they should protect the patent.

Senator WALLGREN. Let us say that we are setting up today a new research laboratory; for instance, I had an appropriation in the appropriation bill to create a metallurgical laboratory out west. If a Government employee patents a process, how would you handle that situation?

Judge ARNOLD. I presume you could make your own contract with the Government employees.

Senator KILGORE. The bill provides for that, and in general the directors shall pay him a bonus for his services commensurate with the value of the patent, and it shall not be patented by anybody then, and the Government reserves the right to license anybody to make it on the same basis.

Judge ARNOLD. You must also protect licensees who use discoveries made by the Government. If you protect them, most of these infringement suits would never be brought—not if the Department of Justice with adequate personnel were on the other side. If the Government lost, all right; at least we would have turned it over to a court of competent jurisdiction.

Senator KILGORE. If you remember, Judge, in the Nye committee investigation in regard to munitions, the fact was brought out that after the last war all of the research developed at the expense of the United States, or a large part of it was submitted to foreign manufacturing companies that were in cartels.

The same was true with armament equipment—torpedoes designed for the Navy were submitted to manufacturers in Germany under agreements for mutual exchange of information.

Judge ARNOLD. I think the remedy is not to expect a businessman to act other than as a businessman, but for the Government itself to turn loose this corner which has been developed.

I would like to see this bill referred to as the magna carta of science, because I think if it is passed it will be one of the greatest single events in the scientific development of this country. I feel that strongly about it. I believe it will not only open new vistas to Government, university, and industrial research but it will greatly stimulate all scientists and technologists. It will provide a focal point for all of them and weld all branches of science together with real and lasting benefit. I believe every man who recognizes the importance of our science, and that should include about everybody, should do all they can to support this bill.

I recognize the difficulties of the thousands of technicians that are tied up with special interests. You cannot expect them to come out and act in opposition to the interests of the companies they represent. I think the only reason that there won't be almost a unified support of the bill among scientists, as there is in agriculture, is the fact that so many of them have become tied up with large concerns whose interests are against the bill.

Senator WALLGREN. In other words, that statement of Dr. Egloff was really an endorsement of the bill?

Digitized by Google

Judge ARNOLD. I don't know Dr. Egloff personally, and I do not mean to be critical, but what other position could he take?

Senator KILGORE. He must protect his personal interest.

Judge ARNOLD. And I think he is quite sincere in identifying the public interest with private interest. It is very difficult to avoid that.

Mr. COLLINS. I understood you to say, Judge Arnold, earlier in the hearing, that statistics showed that 150,000 of the 180,000 small businesses had no research facilities at all?

Judge ARNOLD. I took that from a report which I identified.

Mr. COLLINS. I gathered from your discussion of small business there, that the relative decline of small business might be attributed in part to this technological and scientific bottleneck that they are getting into.

Judge ARNOLD. There is no question in my mind that wherever you turn in industrial development you will find that the scientific bottleneck has prevented them, with all of their energy and initiative, from getting to the top.

Senator KILGORE. I am informed that it has been a custom with a lot of these licensing monopolies or licensing outfits that even where they represent themselves as licensing freely to anyone they have a sliding scale so that the small manufacturer has to pay a commensurately larger royalty than does the big manufacturer, thereby eliminating the small manufacturers from any competition.

Judge ARNOLD. That is right. I testified on that in the Bone committee hearings as one of the patent devices.

For your information, I would like to introduce here my statement before the Bone committee—testimony on a different bill—describing the various methods by which patent control was accomplished.

(The material referred to was marked "Exhibit No. 6" and appears on p. 91.)

Judge ARNOLD. As illustrations, there are what I call the umbrella patent, the accordion patent, the patent pool, licenses to restrict use, licenses to restrict production—I think I have most of them in there if not all of them. I do not, however, describe the sliding scale device in that testimony. If you care to subpena the members of the Department of Justice, I think they have a good deal of information on the sliding scale, Senator.

Senator KILGORE. Then there is one phase of this bill that you might feel is dangerous, the proviso that, on page 17, line 4:

> No such license shall be granted unless the Administrator shall first be satisfied and shall find that no monopoly, monopolistic practice, or unfair competitive advantage will be promoted thereby;

and

> (2) that the charge for user prescribed by the Administrator shall either be a uniform nominal fee or a charge graduated to the volume of production resulting from user.

Judge ARNOLD. I don't think so. There is nothing per se wrong about a sliding scale. It is true that you can use a sliding scale in the manner which you suggest, of course. I see no objection to encouraging production by charging a man less royalties the more he produces.

Mr. COLLINS. Could it be used otherwise?

Digitized by Google

Judge ARNOLD. Of course, we would assume that the Government administrator did not have any interest in creating a monopoly. I notice that my former colleague, Mr. Borkin, thinks it is better to leave it out. I saw no objection when I read it over.

Mr. COLLINS. Do you know what the situation is with the patents now held by the Alien Property Custodian? Have they acquired a great block of them?

Judge ARNOLD. Of course they have, but with respect to that, comity with other Government departments would indicate that I would rather have them testify.

Dr. SCHIMMEL. This bill would require that those foreign patents that have been seized would become the permanent property of the United States. What would your opinion be as to this feature of the legislation?

Judge ARNOLD. I think that is a valuable feature.

Senator KILGORE. That would prevent any future change of administration of that office from permitting that big pool of patents to become a monopoly.

Judge ARNOLD. You remember what happened in the last war—the patents all got back into German hands almost immediately following the war. And there are very many agreements in the Department of Justice where they can show you instance after instance where the American firm—I would not care to testify extemporaneously on this but I will speak generally—where the American firm has a secret understanding with the Germans that although it has taken the patents as an American firm, nevertheless it is protecting their interests and they will get their equitable interests back after the war. We find that repeated, and you can get that for the record by subpenaing the Department of Justice, I am sure.

Dr. SCHIMMEL. Do you think there is still time to use a bill of this kind to spread techniques in order to prosecute the war more favorably? We have run into so many situations already.

Judge ARNOLD. I was talking to Mr. David Podell, the head of our Small Business Unit, and he gave me half a dozen instances which he wanted me to suggest to the committee, but I thought that I had better confine myself to what had happened before I was on the bench; and so I would suggest that you subpena Mr. Podell, and you will just find instance after instance. Of course, there never was a time when this thing was more necessary, and he can show you case after case after case. There are cases coming from the Department of Justice and from the Treasury, which has the power to suspend royalties in a monopolistic situation. There are complaints coming from there, and the thing piles up into a very formidable body of material—all instances of this kind.

Mr. COLLINS. Section 7 (c) provides that the Administrator is authorized to grant nonexclusive licenses under certain terms and conditions and that—

> no such license shall be granted unless the Administrator shall first be satisfied and shall find no monopoly, monopolistic practice, or unfair competitive advantage will be promoted thereby.

I would like to get your opinion on the desirability of that proviso. Is it true in your experience that the granting of a nonexclusive license to all comers might in itself result in monopoly by existing monopolies

Digitized by Google

in securing a license, and then in some way restricting monopoly through that acquisition?

Judge ARNOLD. I don't think that I have ever seen an actual instance where a nonexclusive license would promote monopoly. Nevertheless you can imagine a small, struggling concern getting hold of some new patent, and being unable to maintain itself if it is compelled to license a company that dominates the field. Rather than argue with people about that hypothetical situation, I would not advocate compulsory licensing on a hard and fast rule. One theory of patents is that they are intended to protect small, struggling concerns.

Senator KILGORE. It was like the tariff that was supposed to protect infant industries.

Judge ARNOLD. I mean that you should not tie your Administrator down too tight. I would just assume that if this bill is passed, you will have an administrator that will use good judgment. Of course, he would have to use good judgment—remember the infant industries which the tariff protected. The Administrator could conceivably protect some infant patent industries and abuse this provision.

Mr. COLLINS. On a nonexclusive licensing basis it would be possible to license corporations that might secure the license for other than the national interest. There might be alien corporations operating, or alien-controlled corporations operating in order to get a license. Do you think it would be necessary to have any language protecting the national interest in that respect?

Senator KILGORE. As long as the license were nonexclusive, I don't see how it could, even if it were granted.

Judge ARNOLD. I don't believe in giving this patent administrator a lot of general powers to protect defense, and to protect this, or that, or the other thing. Most of the patent rackets protect, you know.

Senator KILGORE. If there is nothing further, we certainly appreciate your coming here and giving us the benefit of your experience. We will now recess subject to the call of the chairman.

(Whereupon at 4:20 p. m., the hearing was recessed subject to the call of the chairman.)

EXHIBIT No. 2

STATEMENT OF JOHN W. WALKER BEFORE THE SENATE COMMITTEE ON PATENTS REGARDING THE ACTIVITIES OF GENERAL ELECTRIC CO. AND WESTINGHOUSE ELECTRIC & MANUFACTURING CO. WITH RESPECT TO THE DEVELOPMENT OF THE FLUORESCENT LIGHTING INDUSTRY

INTRODUCTION

I appear here in obedience to subpena duces tecum served upon me and upon my superior, Mr. Thurman Arnold, Assistant Attorney General. Pursuant to these subpenas, I have produced here this morning 68 exhibits relating to the development of the fluorescent lighting industry and the control exerted upon such development by General Electric, Westinghouse, and the public utilities. These exhibits are for the most part copies of communications and other documents furnished principally from the files of the General Electric Co., Westinghouse Electric & Manufacturing Co,. the Electrical Testing Laboratories, the Association of Edison Illuminating Companies, Edison Electric Institute, Buffalo, Niagara & Eastern Power Co., and Consolidated Edison Co. of New York.

These documents and the facts they disclose were revealed to the Government as a result of a general investigation, commenced by the Department of Justice in 1939, of the electric lamp and lighting industries. A part of the documents were obtained by inspection of the files of certain of the above-named companies undertaken with their consent, and the remainder of the documents were obtained pursuant to subpenas issued in November and December 1940 by a grand

Digitized by Google

jury sitting in the southern district of New York. Due to a shortage of manpower in the Department of Justice, the investigation was not continued after December 1940, and the documents and facts disclosed therein, which I have produced here, go up only to the end of 1940.

It may be mentioned that as a result of the geenral investigation of the electric lamp and lighting industries a civil suit was filed January 27, 1941, by the Government against General Electric and Westinghouse Electric & Manufacturing Co. and other companies, with respect to incandescent lamps, charging them with monopolizing, attempting to monopolize, conspiring to monopolize, and conspiring to restrain trade and foreign commerce all in violation of the Sherman Antirust Act and conspiring to restrain foreign commerce in violation of the Wilson Tariff Act.

Although the documents which I produce here go up only to December 1940, or a year and half after the commercial introduction of the fluorescent lamp, the activities revealed by these documents are considered by me to disclose an attempt by General Electric Co. and Westinghouse Electric & Manufacturing Co. and the public utilities to obtain control of the fluorescent lighting industry during the period of its development and to regulate the industry in conformity with their respective interests.

THE FACTS

SUMMARY

At the time the fluorescent lamp was commercially introduced by General Electric and Westinhouse in the summer of 1938, the utilities were filled with grave concern, principally because of the belief that the new illuminants would consume far less electricity than incandescent lamps which theretofore had been in general use. The utilities desired to have development of the fluorescent lighting industry retarded to the greatest possible extent. General Electric and Westinghouse, for their part, wished to enlist the support of the utilities in the efforts and plans of General Electric and Westinghouse to establish and maintain control over the manufacture and sale of fluorescent lamps and equipment for their operation.

General Electric and Westinghouse and the utilities have sought to prevent the new fluorescent lamp from being used by the public on any basis that would reduce the consumption of electricity. At about the time the fluorescent lamp was first put on the market, they jointly formulated a plan whereby fluorescent lamps would be used only for special "plus" lighting purposes, such as illumination of showcases and for lighting supplementary to that of incandescent lamps. This policy for a time was successfully followed. However, the so-called independent manufacturers commenced to sell fluorescent lamps and to inform the public that they could save on their electric-light bills by using such lamps. As a result, General Electric, Westinghouse, and the utilities had to formulate a new program, and they developed the policy of advocating fluorescent lamps for "high intensity" lighting, which would consume as much electricity as would ordinarily be consumed by incandescent lamps. It became apparent that in order to control the fluorescent lighting industry so as to safeguard their respective interests, the manufacturers of fixtures and auxiliary equipment required for operation of fluorescent lamps would have to be organized and controlled by General Electric, Westinghouse, and the utilities. They formulated a program to effect this purpose.

The principal factor that made it impossible for General Electric and the utilities to completely retard and control the development of the fluorescent lighting industry was the aggressive promotion of fluorescent lighting by an "independent" manufacturer, namely the Hygrade Sylvania Corporation, and the activities of this "independent" are the only barrier existing today to General Electric, Westinghouse, and the utilities getting absolute control of the new industry and operating it solely in conformity with their own mutual interests.

BACKGROUND

1. Position of General Electric and Westinghouse in the Lamp Industry and the Electrical Industry

For many years General Electric has possessed a firm and practically absolute domination and control over the incandescent lamp industry. Westinghouse, which manufactures both incandescent and fluorescent lamps, shares with General Electric in its domination and control of the industry.

Digitized by Google

In addition to maintaining a patent cross-licensing arrangement with Westinghouse, General Electric has given Westinghouse the right to use its lamp trade-mark "Mazda." General Electric and Westinghouse are the only two manufacturers having the right to use this trade-mark, and they are frequently and commonly referred to as the "Mazda" manufacturers.

In addition to electric lamps, General Electric manufactures and distributes a complete line of electrical apparatus, ranging from the smallest items to giant turbines and generators. Westinghouse also makes a substantially complete line of electrical apparatus. Other lamp manufacturers depend mostly on revenues from their lamp sales to remain in business.

2. Organization in the Utilities Industry

The utilities, although ordinarily independent of each other, except where grouped together in holding companies and organizations such as Electric Bond & Share Co., can and do act in concert in matters affecting their common interest. For instance, over 100 utilities belong to the Edison Electric Institute (sometimes hereinafter referred to as the E. E. I.), the operating area of which utilities collectively extends to substantially every part of the country. The E. E. I. is made up of committees and groups, composed of representatives of the member utilities, who among other things handle policies for the industry on matters coming within the purview of the committees and seek to effect these policies. The policies are determined at meetings of the E. E. I. as a whole, or they may be formulated by the particular committees themselves, on the basis of their knowledge of the desires of the industry, which frequently is derived from questionnaires sent out to each utility.

One of the most important of the committees of the E. E. I. is the lighting sales committee. This committee has over many years worked very closely with representatives of General Electric and Westinghouse in determining policies to be pursued with respect to the manufacturer, distribution, and use of lamps manufactured by the two Mazda companies and with respect to the promotion of such lamps by the utilities.

In 1940 the lighting sales committee of the E. E. I. had as its members the following:

J. E. Mueller, chairman, West Penn Power Co., Pittsburgh, Pa.
W. J. Amos, New Orleans Public Service, Inc., New Orleans, La.
C. T. Bremicker, Northern States Power Co., Minneapolis, Minn.
I. L. Illing, Wisconsin Electric Power Co., Milwaukee, Wis.
Paul Manchester, Blackstone Valley Gas & Electric Co., Pawtucket, R. I.
Howard M. Sharp, Buffalo, Niagara & Eastern Power Co., Buffalo, N. Y.
W. A. Stannard, Consumers Power Co., Grand Rapids, Mich.
M. N. Waterman, Central Hudson Gas & Electric Corporation, Poughkeepsie, N. Y.

Another large organization of utilities is the Association of Edison Illuminating Companies (sometimes hereinafter referred to as A. E. I. C.), which is composed of a large number of utility companies, the collective operating area of which extends over the United States. Like the E. E. I., the A. E. I. C. has various committees which handle particular phases of the electrical industry of importance to the member companies. The committee to which lamp matters are delegated is the lamp committee of the Association of Edison Illuminuating Companies. This committee, like the lighting sales committee of the E. E. I., has worked very closely with representatives of General Electric and Westinghouse. In 1940 the members of the lamp committee were as follows:

Alex Dow, chairman, E. J. Doyle, C. E. Groesbeck, H. P. Liversidge, John C. Parkern, R. H. Tapscoll, and Preston S. Millar, executive secretary of lamp committee and chairman of the lamp subcommittee.

Subcommittee: H. B. Gear, Clarence L. Law, Charles C. Munroe, and C. Bertram Regar.

The Electrical Testing Laboratories (sometimes hereinafter referred to as E. T. L.) is an organization owned almost entirely by public utility companies which is engaged in commercial testing work on electric lamps and other electrical apparatus. The largest users of E. T. L. services are General Electric, Westinghouse, and various utility companies and associations of such companies. For General Electric and Westinghouse, Electric Testing Laboratories test their lamps which are to be given the Mazda trade-mark to determine that such lamps meet the so-called Mazda standards. For certain utility companies and associations of utility companies the E. T. L. tests lamps, principally the

Digitized by Google

lamps of the Mazda manufacturers, and on the basis of these tests submit reports to the utility companies and associations thereof as to the characteristics, quality, and uses which may be made of the lamps tested. The principal customer of the E. T. L. in the utility field is the A. E. I. C. The president of E. T. L. is Mr. Preston S. Millar, who is also executive secretary of the lamp committee and chairman of the lamp subcommittee of the A. E. I. C.

3. General Relations Existing Between General Electric and Westinghouse, on the One Hand, and the Public Utilities on the Other Hand

For many years there have been very close and intimate connections between General Electric and Westinghouse, on the one hand, and the utilities, as a group, on the other. The basis of the relations seems to be an understanding that each side will work in the interests of the other. The utilities undertake to sell and promote Mazda lamps—and the appliances and other electrical apparatus of the Mazda manufacturers as well—and on their side the Mazda manufacturers undertake to promote their products in such a way as to add to the amount of electricity consumption. The Mazda companies also support and participate in campaigns and programs conducted by the utilities to increase use of electricity supplied by them. For example, several years ago a large number of utilities gave to their customers free renewals of lamps, the purposes being to cause the customers to use lamps of higher wattage and to keep their sockets filled, and the lamps used in these campaigns were Mazda. General Electric and Westinghouse have supplied the lamps at reduced prices to the utilities giving free renewals.

The following Westinghouse interoffice correspondence dramatically illustrates the situation confronting the American consumer in the lighting industry:

SEPTEMBER 18, 1936.

Mr. H. A. CROASDALE,
Manager, Philadelphia Office:

You will recall that when Mr. Beggs was over here several months ago because of subject's account, he suggested to Mr. Lowther that Westinghouse conduct a survey of some of their restaurants in order to save Horn & Hardart money on their consumption of electricity. This survey has been postponed from time to time due to vacations and sickness of the men who must assist us in making it and it has now been scheduled for around the 1st of October.

It has come to my attention that the Philadelphia Electric Co. have been working on this account for years to get them to increase their lighting. They have been preaching good lighting to them for so long a time that they are gradually changing the lighting in some of their restaurants and Westinghouse are getting some orders for lighting equipment.

I am afraid that we will become involved in a very embarrassing situation if we tell Horn & Hardart in our survey how they can save money by cutting down their light. Do you have any suggestions to make as to how to handle this?

W. O. JAMES.

(Exhibit 1.)

The problem presented to the Westinghouse's Philadelphia office, with respect to the Horn & Hardart survey, was brought to the attention of Mr. E. W. Beggs, assistant manager of the commercial engineering department of Westinghouse, by the following letter:

SEPTEMBER 22, 1936.

With further reference to the subject's survey, it has now come to my attention that the Philadelphia Electric Co. has been working on this account for a number of years in an endeavor to have them increase their lighting load. As a result of the Philadelphia Electric Co. preaching good lighting to them for such a long period, the subject are gradually changing their lighting equipment in some of their restaurants, and the Westinghouse Co. is securing some nice orders for lighting equipment.

In view of this, I am sure we will become unfavorably involved with our good customer, the Philadelphia Electric Co., should we suggest in our survey to the subject that they can save money by cutting down their light.

"Mr. Cunningham is the individual with whom the Philadelphia Electric Company has been dealing, and he also is the individual with whom we would make our suggestions of lower cost in lighting. Therefore, I recommend that we go no further nor make any reference in our survey regarding suggestions of lower cost. However, we would appreciate any other suggestions you might

Digitized by Google

have that would enable us to strengthen our position with this company" (exhibit 2).

In his reply, dated October 1, 1936, to the manager of the Philadelphia office, Mr. Beggs stated:

"Subject: Horn & Hardart Baking Co., Philadelphia, Pa.

"In your letter of September 22, you discuss this negotiation and in particular you recommend that we do not make any suggestions regarding reduced cost of lighting.

"I am somewhat surprised that you should discuss this because actually the last thing in the world that we would suggest in this office would be the reduction in lighting intensities or lighting levels. The key to greater business is definitely along the line of stepping up lighting levels, and it would be suicide for us to urge anything else" (exhibit 3).

One of the things which most clearly emphasizes the intimacy of the relations between General Electric and Westinghouse, and the utilities, is that substantially all of the utilities deal only with Mazda lamps—it is not just that they sell Mazda lamps but that they advertise them and advocate and promote their use in every way.

The utilities have been handling the lamps of the two Mazda companies almost exclusively for so long that one now feels a tendency to accept it as a natural state of affairs. However it has not just happened. That both interests benefit is clearly exemplified by the manner in which the two interests have worked together in order to secure and maintain control over the fluorescent lighting industry and exploit that control in accordance with their respective interests.

THE FLUORESCENT LAMP AND ITS CHARACTERISTICS

A fluorescent lamp is a device consisting essentially of a glass tube, materials possessing properties of fluorescence which are coated upon the inside walls of the tube, a mixture of mercury vapor and argon gas contained in the tube, and caps or bases which seal the tube one at each end, and through each of which is fixed an electrode.

One of the outstanding characteristics of the fluorescent lamp is that it is much more efficient than the incandescent lamp, and consequently it uses much less electricity in producing a given amount of light than the incandescent lamp and thereby enables the consumer to save on his electricity bills. Fluorescent lighting is more efficient than incandescent lighting not only because fluorescent lighting affords more lumens per watt but also because it is possible to use fluorescent lighting for direct lighting in many instances where incandescent lighting would have to be indirect.

REASONS WHY THE PUBLIC UTILITIES AND MAZDA LAMP COMPANIES HAVE UNDERTAKEN TO RETARD AND CONTROL THE DEVELOPMENT OF THE NEW ILLUMINANT

The fact that less electricity is needed in the operation of fluorescent lamps than in the operation of incandescent lamps has been the principal reason why the utility companies have desired to control the development of the fluorescent lighting industry and retard the use of fluorescent lighting. For a time after its commercial introduction the installation cost of fluorescent lighting was such that it was not cheaper for the consumer to use fluorescent lighting, but even during this time the utilities realized that fluorescent would become cheaper and this view is reflected in a report written for the member companies of the E. E. I. by three members of the E. E. I. lighting sales committee, Messrs. Sharp, Skinner, and Mueller, entitled, "Plain Talk About Fluorescent Lighting" (printed in 1939) in which it is stated:

"When the economics do change and fluorescent lighting becomes cheaper for the consumer utilities will be getting a much smaller share of the consumer's lighting dollar and only about one-half the revenue for the same amount of light. Therefore, it does not seem safe to adopt merely a policy of watchful waiting. Immediate action is needed to meet the situation" (exhibit 4).

Again, Mr. Mueller stated at a conference on fluorescent lighting held between September 30 and October 3, 1940:

"However, while fluorescent lighting will have no alarming effect on present revenues, it will have a very definite effect on lighting-revenue sales, and on utility-unit sales costs. Fluorescent is normally referred to as having about

Digitized by Google

twice the efficiency of incandescent lighting. This is true. However, in actual practice the ratio is much higher.

"Incandescent lighting has been used in recent years to a large extent in a semi-indirect or indirect manner but usually with some diffusing medium. Fluorescent, on the other hand, is usually applied in a direct or semidirect manner and frequently with no diffusing medium.

"It is when the method of utilizing the light is taken into consideration that this ratio assumes more alarming proportions. For example, when incandescent lighting is used in enclosing globes as compared to a semidirect fluorescent unit, the ratio of wattage to produce the same lighting intensity is about two to one. However, when incandescent lighting is used in a totally indirect manner as compared to direct fluorescent lighting the ratio may be as high as six to one. * * * This is why so many of the surveys made to date tend to show that incandescent installations are being replaced with about 50 percent of their wattage by fluorescent" (exhibit 5).

As a result of a conference on July 11, 1939, between Mr. Sharp and Mr. Hogue, of the Buffalo, Eastern & Niagara Power Co., and Mr. A. E. Snyder, executive sales manager of Westinghouse lamp division, and Mr. R. G. Slauer, of the commercial engineering department, Mr. Slauer wrote to Mr. Snyder that—

"Regardless of what we wish to think, most fluorescent installations of the last year have resulted in decreased load for the utility. This does not mean that saving in energy costs has always been the incentive—better lighting has as often been the most important point. Nevertheless a lessened load results.

"The average utility-lighting man sees in the rise of fluorescence a decrease in his relative importance. Here is a comparison, based on a 4-cent rate, with equal costs to the user and equivalent results. The design data are unfavorable to fluorescence—almost any other selection would emphasize the differences.

"For every dollar the user spends annually with incandescence the utility gets 80 percent; the contractor, 10 percent; the equipment suppliers, 6 percent; the lamp suppliers, 4 percent.

"For fluoresence, the dollar is divided: The utility, 44 percent; the lamp suppliers, 24 percent; the equipment suppliers, 20 percent; the contractor, 12 percent.

"In other words, to the utility, fluorescent is only one-half as important as incandescence; to the lamp suppliers it is six times as important; to the equipment manufacturers, three times as important; to the contractor, 20 percent more important" (exhibit 6).

The fluorescent lamp is an electric-discharge lamp and auxiliary apparatus is required to control the discharge. This auxiliary apparatus consists of: (1) A ballast which is a device to govern the flow of electricity, and (2) a starting switch required to facilitate the starting of the lamp.

Ballasts may be designed to operate a single lamp or to operate two lamps together. The single-lamp type of ballast in an electrical circuit introduces what is known as a power factor, this being a differential in phase relation between voltage and current. This power factor may be about 50 percent. Ballasts for two lamps also introduce a power factor, but in this instance it is near unity, being 90 or 95 percent or more. Low-power factor may, if uncorrected, require the installation of lines of greater capacity by the utility companies.

The fear that fluorescent lighting might be operated at low-power factor on their lines was the second reason for the desire of the utilities to control the development of the fluorescent-lighting industry and to retard the use of fluorescent lighting. However, after fluorescent lighting had been on the market for over a year the manager of the commercial engineering department of the lamp division of Westinghouse expressed the belief that, in view of the development of ballasts for the operation of two lamps and the promotional policies of the mazda manufacturers, there was "little justification for the anxiety expressed by the utility companies, who, for years, have permitted and encouraged the sale of all sorts of appliances with even lower power factor than our first fluorescent equipment" (exhibit 7). But the utility companies felt that by cooperation with the mazda lamp companies they might be able to demand that all fluorescent lighting be corrected for power factor and this would also have the incidental effect of making fluorescent lighting more expensive to install and thus would aid in deterring the use of fluorescent lighting generally.

On their side, General Electric and Westinghouse desired to establish and maintain control over the manufacture and sale of fluorescent lamps and equipment for their operation. At the time the fluorescent lamp was introduced commercially, General Electric and Westinghouse feared that their control of the electric-lamp industry might be destroyed by "independent" lamp manufacturers

Digitized by Google

obtaining a strong position in the fluorescent-lamp manufacturing industry. Consequently General Electric and Westinghouse wished to strengthen their cooperative relations with the utilities companies in order to insure that these companies would deal in and foster the use of Mazda fluorescent lamps to the exclusion of fluorescent lamps made by other manufacturers and thus assist General Electric and Westinghouse in dominating and obtaining and maintaining control over the fluorescent-lighting industry. Moreover, General Electric and Westinghouse wished to be assured the support of the utility companies for programs and plans which General Electric and Westinghouse were to put into effect as a part of their scheme to dominate and control the fluorescent-lighting industry.

PROGRESS OF THE COOPERATION BETWEEN THE MAZDA LAMP MANUFACTURERS AND THE PUBLIC UTILITIES

1. Negotiations and Meetings Between Officials of General Electric and Westinghouse and the Utility Companies

General Electric and Westinghouse and the public utilities early recognized that the fluorescent-lighting industry and the use of fluorescent lighting could be controlled by them to the benefit of each by concerted action.

At about the time the fluorescent lamp was announced commercially by the Mazda lamp manufacturers a meeting was called of the lamp subcommittee of the A. E. I. C. and officials of the General Electric lamp department, to be held at Nela Park, the headquarters of the General Electric lamp department. This meeting, which was held on May 27, 1938, was called "in order [for the members of the lamp subcommittee] to confer with the Mazda lamp manufacturers concerning the assimilation of fluorescent * * * lamps" (exhibits 8 and 9) .

On October 27, 1938, soon after General Electric had placed its fluorescent lamps on the market, Mr. E. E. Potter, manager of the eastern sales division of the General Electric lamp department, wrote Mr. Sharp, manager of the lighting bureau of the Buffalo, Niagara & Eastern Power Co., stating:

"I do want to tell you now, however, that all of us thoroughly believe the story we are telling of using fluorescent for plus lighting and we are making every effort from here to promote it on that basis" (exhibit 10).

Even at this time General Electric recognized that longer, larger, and higher-voltage fluorescent lamps would inevitably appear on the market and that "with these lamps, it's going to be possible to produce the same or increased foot candles [of light] at a very practical installation cost and with a very decided drop in wattage" (exhibit 11). In respect to this situation, Mr. H. F. Barnes, of the sales promotion department of the General Electric lamp department wrote other officials of the company a letter on October 28, 1938, in which he stated among other things that he was very much disturbed over the utility reaction which he was sure General Electric would have as soon as the larger fluorescent lamps were announced. He declared:

"Certainly there should be no publicity of any kind on any further development on fluorescent until we have had a chance to see where we are going with our present lamps and to formulate a very definite sales, sales promotion, and advertising program which is definitely pointed at daylight intensities of a high order for stores and factories" (exhibit 11).

On January 24, 1939, Mr. Stryker, an official of the General Electric lamp department in charge of utilities sales promotion, wrote Mr. Barnes that the problem involved in keeping "the intensities up in fluorescent installations will not be too difficult when both the utility and the Mazda lamp manufacturer are working together for this common end" (exhibit 12).

During this period there were discussions between Mr. E. F. Strong, manager of the General Electric lamp department sales division for the Buffalo, N. Y., area, and Mr. Skinner, vice president of the Buffalo, Niagara & Eastern Power Corporation, concerning the statement of policy which General Electric should issue with regard to the use of fluorescent lighting. On March 7, 1939, Mr. Skinner wrote Mr. Strong in connection with a copy of a proposed statement of policy on this subject which Mr. Strong had furnished Mr. Skinner. Mr. Skinner stated:

"I have reviewed this rather carefully with our lighting people and have come to the conclusion that, in its present form, it is not an acceptable statement of what we think the policy should be" (exhibit 13).

Mr. Skinner indicated that the statement of policy should be corrected to show that fluorescent Mazda installations would be as expensive or more expensive

Digitized by Google

than existing incandescent Mazda installations in almost every instance. He further wished to have the statement corrected to state that the "use of bare lamps should be most carefully restrained." The letter concludes "the foregoing indicate quite a substantial difference in opinion on the appropriate policy applicable to those lamps and unless the authorities in Cleveland have modified their stand as included in the printed statement of policy which you furnished me, I think the matter warrants some further discussion."

A conference of General Electric fluorescent specialists was held at the Nela Park headquarters of the lamp division of General Electric on March 28, 1939, to discuss fluorescent lighting. At this conference Mr. Boynton, manager of the eastern sales division of the lamp division of General Electric, "read a long letter from a utility executive criticizing severely our policy, in regard to fluorescent lamps." Mr. E. E. Potter, manager of the western sales division of the lamp division of General Electric, talked about the problem with the utilities, "and urged the field men to restrict promotion to plus lighting and not to advocate these lamps for general lighting to replace present incandescent lamps" (exhibit 14).

At about this time, officials of the General Electric field offices were commencing to work with officials of the various utilities operating in their particular areas. For instance, Mr. E. G. Strong, manager in the western part of New York State for the lamp department of General Electric, was working with officials of Buffalo, Niagara & Eastern Power Corporation to determine the basis on which fluorescent lighting would be promoted in their area. Mr. Strong discussed with Mr. Skinner and Mr. Sharp, of Buffalo, Niagara & Hudson, a revision of the then-current General Electric statement of policy on the use of the fluorescent lighting. Mr. Strong in a letter dated April 12, 1939, to Mr. Ward Harrison, chief engineer of the lamp division of General Electric, suggested to Mr. Harrison that published matter concerning fluorescent lamps "minimize for the present the application of daylight fluorescent lamps for other than special applications which would mean plus installations and plus business for ourselves as well as the utility companies." He further stated that he felt:

"A very positive need of going along with the utilities in our territory in such manner as to impress upon them the fact, which is true, that we are attempting to use the fluorescent product to secure lighting effects through installations which really mean additions to the use of electricity in lighting and to avoid the use of fluorescent lamps for general illumination where either our tungsten-filament lamps are replaced in present installations or where large areas are contemplated in new buildings or in the revamping of old buildings as we all know that our present tungsten filament line with the present complete line of fixtures available must still be our revenue-producing line and with the present status of auxiliary equipment, we will be in a better position with the utilities not to go too fast on large installations.

"We are working at the present time with the local Niagara Hudson representatives so that we may all think along the lines which will be most constructive for the industry as a whole and if I can secure as promptly as possible the new statement of policy of the General Electric Co. in the use of fluorescent lamps, it will be very helpful in talking with Mr. Skinner, Mr. Sharp, and others of the power company with whom we are working * * *" (exhibit 15).

In April 1939 the E. E. I. published a report entitled "Current Practice in the Promotion and Application of Fluorescent Lamps," which summarized the results of an investigation" * * * conducted by the lighting sales committee of the Edison Electric Institute by means of a questionnaire, for the purpose of obtaining a cross-section of utility opinion and fact concerning the promotion and application of the fluorescent lamp. Ninety-nine individuals responded, representing 93 utility companies, from every portion of the United States" (exhibit 16).

Following the publishing of the E. E. I. report referred to immediately above, it was decided that a conference should be held between members of the lighting sales committee of the E. E. I. and officials of the Mazda lamp manufacturers to review the fluorescent-lighting situation so as to work out a program for the promotion of fluorescent lighting which would have the approval of both the utilities in general and the Mazda lamp manufacturers (exhibit 17). On March 26, 1939, Mr. Sharp wrote Mr. Harrison stating that he felt there were three objectives that should be discussed at the proposed meeting. The first objective would be agreement on the applications of the fluorescent lamp; the second would be the cooperative participation of the promotion and publicity portions of the industry and the development of public acceptance; and third, the development and marketing of equipment necessary to carry out the engineering and promotional aspects of the new light source (exhibit 18).

Digitized by Google

The meeting which had been proposed was held on April 24 and 25, 1939, at the headquarters of the General Electric lamp department at Nela Park, Cleveland. Present were the following: J. B. Mueller, manager of commercial sales, West Penn Power Co., Pittsburgh, Pa.; H. M. Sharp, Buffalo, Niagara & Eastern Power Corporation, Buffalo, N. Y.; M. M. Waterman, lighting service bureau, Central Hudson Gas & Electric Corporation, Poughkeepsie, N. Y.; Paul Manchester, Blackstone Valley Gas & Electric Co., Pawtucket, R. I.; W. J. Amos, general sales department, New Orleans Public Service, Inc., New Orleans, La.; Norman MacDonald, E. T. L., New York City; Oscar Cleaver, Westinghouse, Bloomfield, N. J.; McKenna, Harrison, O'Day, Barnes, Burrows, Stryker, Sturrock, Boynton, and Potter of General Electric. (Minutes of the meeting, exhibit 19; draft of minutes, exhibit 20.)

This conference was referred to by the utility representatives present as a "council of war" (exhibit 21). The meeting was concerned principally with the question of the basis upon which fluorescent lighting would be promoted and with having the representatives of all interests present decide upon a program for its promotion. The utility representatives were mainly concerned with preventing fluorescent lighting from being advertised and sold to the public on the basis of being a lighting source which would enable the public to save on their electric bills. The representatives of the utility companies also sought to make sure that fluorescent lighting should be promoted with corrected power factor of the lamp.

Mr. Sharp suggested that the Mazda lamp manufacturers for the present omit the use of advertising copy to promote fluorescent lighting to be used for general illumination. Mr. Amos stated that there were many supplementary lighting applications for fluorescent lamps and that lamps should be sold only for such applications. Mr. Mueller stated that he thought that fluorescent lighting should not be recommended for the average small jewelry or drug store (exhibit 19).

In conformity with these suggestions and the wishes of the utility representatives present, it was decided that use of fluorescent lamps for general lighting would not be emphasized "until commendable equipment is available giving 50- to 100-foot candle levels" (exhibit 19).

As to power factor it was agreed at the meeting that—

"It is to the best interest of all concerned that fluorescent lighting be installed with corrected power factor at the lamp. All emphasis will be on the use of corrected circuits, that is, corrected to both flicker and power factor" (exhibit 19).

One of the principal functions of the meeting was to determine and agree upon a statement of policy which General Electric and Westinghouse should announce with regard to the uses to which fluorescent lamps were adaptable. Such a statement of policy was mutually agreed upon by the representatives of the various interests.

As a result of the conference General Electric and Westinghouse each issued statements of policy pursuant to the decision reached at the conference. The Westinghouse statement read in part:

"*We will oppose the use of fluorescent lamps to reduce wattages.*" [Italics theirs.] (Exhibit 22.)

The General Electric statement, issued on May 1, 1939, stated:

"The fluorescent Mazda lamp should not be presented as a light source which will reduce lighting costs" (exhibit 23).

According to Mr. Kewley, manager of the lamp department of General Electric, General Electric's statement of policy was "issued particularly to allay the fears of the utility companies" (exhibit 24). According to Mr. Robinson of the lamp department, the statement of policy constituted a declaration that General Electric would "play good ball with you central stations but will expect the same brand of ball from you, too" (exhibit 25).

General Electric and Westinghouse officials met with members of the technical subcommittee of the A. E. I. C. lamp committee on May 18, 1939, in New York City. At this meeting was read "the most recent statement of promotional policy issued by the manufacturers of fluorescent Mazda lamps * * * [and there were pointed out] certain changes which had been made after the issuance of an earlier statement. These changes were made by the lamp manufacturers after it had been brought to their attention by the utility representatives that the earlier statement contained grossly exaggerated claims for the new fluorescent lamp" (exhibit 26).

It was planned that the group which had gotten together at the Nela Park conference should in the future continue to meet together from time to time to

Digitized by Google

determine that the lamp companies and utility companies were each promoting fluorescent lighting on the basis decided upon at the conference. During the conference it had been "suggested by Mr. Harrison and enthusiastically seconded by Mr. Cleaver that the more or less unofficial group which had gotten together in this conference in Cleveland be continued so as to act as a liaison body between the lamp companies and the utility companies and also to check results as the new methods of promotion agreed upon at the conference developed" (exhibit 27).

Although the utility officials present at the Nela Park conference were members of the lighting sales committee of the E. E. I., these officials, in deciding with officials of the Mazda manufacturers upon a program for the promotion of fluorescent lighting, acted only on behalf of themselves and not on behalf of the E. E. I. or its lighting sales committee. However, it was planned that the program decided upon at the conference should be submitted to and approved by the E. E. I. and that the E. E. I. should inform its member companies of the program and obtain general utility support for carrying out the program in cooperation with the Mazda manufacturers. On May 2, 1939, Mr. J. E. Mueller, manager of commercial sales of the West Penn Power Co., and a member of the lighting sales committee, wrote Mr. Ward Harrison of General Electric that—

"I sensed a little feeling of disappointment on the part of a few when it was made clear that the utility men, in agreeing to the plan, were agreeing only for themselves as individuals, and not for the Edison Electric Institute or its lighting sales committee.

"I believe I speak for the utility men present when I say that we are just as anxious as the lamp companies to officially get the utility industry at large behind the development of fluorescent lighting along the sound methods of promotion agreed to at the conference. We, of course, are marking time—and I presume the lamp companies are doing the same thing—in giving the conference any publicity until the minutes are available and the utility men present are able to submit this to the lighting sales committee for approval and action. If approved, it can then be brought to the attention of the utility industry through the proper channels" (exhibit 28).

On May 11, 1939, Mr. Mueller, chairman of the E. E. I. lighting sales committee, wrote a general letter to each of the members of the committee (exhibit 28). He stated:

"Messrs. Amoss, Manchester, Sharp, Waterman, and the writer were recently invited by the two lamp companies to Nela Park to discuss the subject of fluorescent lighting. Attached are the minutes of this discussion for your information and criticism.

"The utility men present felt that the lamp companies had gone as far as they could in meeting the past objections to their methods of promoting fluorescent lighting as brought out in the report of this committee on the subject. If the methods discussed at this conference are now put in operation by the lamp companies, manufacturers, and utilities the utilities will be in a position to take advantage of this new light source and help to direct its development along sound lines.

"If the committee is in favor of the objectives as outlined, it is planned to bring them to the attention of all those people who answered the original fluorescent questionnaire and obtain their reactions. If this reaction is still favorable, publicity on these objectives and methods of promotion, in suitable form, will go out to all members of E. E. I., recommending cooperation with these methods in the development of fluorescent lighting.

"Will you please let the chairman have your reaction to these minutes, and also send a copy of your letter to Howard Sharp. This is a subject of vital interest to the entire industry, so speed of action is of prime importance at the present time. We would like to ask that all members of the committee, including those in attendance at the conference, get their reaction to this proposal in the mail by Tuesday, May 16."

Along with a copy of the above general letter, Mr. Mueller wrote Mr. H. E. Dexter, commercial manager of the Central Hudson Gas & Electric Corporation and a member of the lighting sales committee, as follows:

"As you can see from the attached general letter to the lighting sales committee in regard to the recent fluorescent-lighting conference, present plans are as follows: To obtain the approval of the committee; obtain the reaction of a representative number of utility companies, which would be those who showed interest in the subject by answering the questionnaire; and then by means of suitable publicity make known to the entire membership of E. E. I. the con-

Digitized by Google

structive changes which came as a result of the fluorescent lighting report. As part of this last piece of publicity, the committee would probably recommend that the utility industry 'get on the bandwagon,' so to speak, take advantage of this new light source, and control the development of fluorescent lighting along sound lines by actively promoting it, first in limited fields, and then in ever-widening fields, as the economics of fluorescent lighting change.

"I think that possibly one of the most important results of the conference was the fact that the lamp companies now seem inclined to take the utilities into their confidence as part of the lighting industry in the development of promotional plans, instead of 'shooting the works' first, and then letting us know about it" (exhibit 30).

With one exception, the entire lighting sales committee "endorsed the results of the conference and were in favor of the plan of action." The one exception was Mr. C. T. Bremicker, of the Northern States Power Co., who wrote (exhibit 31) Mr. Mueller on May 16 that—

"We believe that if this situation is to be corrected it involves the necessity of action on the part of the lamp company going far beyond the revised statement of policy as approved by this meeting."

Mr. Bremicker wanted a specific retraction from the General Electric Co., in which the General Electric Co. would state—

"That fluorescent lighting is not now known to be applicable for any lighting purposes except colored or atmospheric lighting and certain phases of localized lighting such as wall cases 'show cases and display niches'."

Mr. Bremicker further stated that—

"We do not believe that the utility companies should allow themselves to be hoodwinked into a cooperative program in promoting fluorescent lighting by little power factor correction salve and the vague promises of what the lamp companies are going to do at some undisclosed future date.

"We regret that we are unable to approve the committee's action in this matter and trust that we do not seem to be arbitrarily antagonistic in our posiion. We are willing and anxious to promote any improvement in lighting which is proved practical and beneficial to the public in making possible improved seeing conditions, but until we feel that such equipment is available we cannot extend our cooperation."

However, all the other members of the lighting committee approved carrying out the program decided upon at the Cleveland conference. Mr. Mueller observed that "This was the most nearly unanimous agreement we have had on this controversial subject since the conference, and I think Carl's [Mr. Bremicker's] attitude would change if he had the benefit of the background we had because of the Cleveland conference" (exhibit 32).

On May 15, Mr. Sharp, of the lighting sales committee, replied to Mr. Mueller's general letter, stating in part:

"Our first report 'Current Practice in the Promotion and Application of Fluorescent Lamps' stated that it was committee opinion that utility lighting departments should be diligent in specifying fluorescent lamps where they rightfully belong and that we felt the utilities generally would cooperate in any well-considered program for the application of these lamps. The results of the informal meeting we had at Nela Park seem to me to have a very direct bearing on that recommendation, so that I would be very much in favor of preparing another report in which we could specifically go into more detail on the following items:

1. Correct applications for fluorescent lamps as proven by experience.
2. Methods of balancing circuits so as to correct power factors and eliminate stroboscopic effect.
3. Presentation of a uniform method for cost analysis.

"On these three items, it seems that we have material which is essentially fundamental, so that it could be considered worthy of committee action, but beyond that these items are also potent as influencing local or individual promotional efforts. I also feel that elaboration of these items will be of help to the equipment manufacturers who are attempting to arrange for specifications and certification tags for equipments utilizing fluorescent tubes.

"It is apparent that the lamp manufacturers have very definitely included the utilities in their plans" (exhibit 33).

On May 22, Mr. Sharp again wrote Mr. Mueller and stated:

"I was in New York last week and had an opportunity to talk with Ernest Greenwood about the fluorescent situation. He suggested that instead of sending out either our minutes of the Cleveland meeting or a condensed report, that we send a letter to 30 or 40 of our correspondents containing only a brief outline,

Digitized by Google

such as I have set up on the attached sheet. Such a procedure would indicate that the committee is still on the job, serve to keep the utility group united, and give our committee some additional backing from the field, thereby making it harder for anybody to divide our forces. Upon receipt of the replies from the field, which as you will note we have made very easy, we can prepare a condensed report and get it out as an interim study.

"I have read with considerable interest the letter you received from Carl Bremicker. While I think he has gone off the deep end, it is that kind of field information we require. In more than one-quarter there is just a little suspicion that our committee may suddenly sell out, and that the General Electric Co. is only waiting for some indication of that before crashing through with another promotional campaign, which may be equally offensive to the majority of the utilities. Our report can allay that fear very nicely" (exhibit 34).

On May 29, 1939, Mr. Mueller wrote Mr. Sharp a letter (exhibit 32) in which he informed him of the favorable reaction to his general letter of May 11 to the members of the lighting sales committee and continued by stating that in—

"Looking back at the meeting in Cleveland, I think the lamp companies agreed to make more changes in their operation and methods of promotion than I had expected before I attended the conference. In the words of Jim Amoss, 'it was a most complete capitulation,' although he can't quite understand the reason why there was such a change from the first day to the second day. In trying to figure out why, I think it was probably due to the fact that they realized they were definitely on unsound ground the way they had been operating, and they also knew from the fluorescent lighting report that the utilities realized it and were going to do something about it, and they know that they really couldn't put across any lighting promotion without the help of the utilities. They were anxious to settle these matters with our group, because they thought that we were in the best position to get them something in return for their capitulation.

"Amplifying this, if they agreed to 'play the game square,' by getting the utilities behind fluorescent lighting, they could sell more fluorescent lamps in places where they were sound, with the aid of the utilities, than they could sell in sound and unsound places with the 'bucking' of the utilities.

"Unless our committee does something now to give them some publicity on their change of pace, and to get the utility industry as a whole interested in the promotion of fluorescent lighting along sound lines, I think they will drop us and either try to get action through some other body, or else come out with another 'to hell with utilities' campaign, and go it alone, knowing that they have quite a strong customer appeal in their efficiency and novelty story. They also realize that within a year or two at the most, the economics will change, which will make them right in the end, and in the eyes of a large number of utility people who still believe the tungsten lamp story, make bums out of the utility men who really fought for sound principles in the beginning.

"In summing this up, if the lamp companies do what they agreed to do at Cleveland, and if we want to continue to tell the lamp companies how we want to promote it, we will have to get the utility industries interested in the promotion of fluorescent lighting. * * * I think our greatest need right now is for you to prepare a draft of a report on which we can get the committee's criticism and approval * * *."

Mr. Sharp thereupon drew up a draft of a report which he entitled "Developments in Fluorescent Lighting," on the new program for promotion of fluorescent lighting and submitted copies of this draft to members of the lighting sales committee. With respect to this report, Mr. Bremicker wrote Mr. Sharp on June 15 (exhibit 35) that—

"* * * We are very happy to say that this bulletin on the whole meets with our enthusiastic approval and that many of the points, about which there appears to have been a divergence of opinion or a misunderstanding between ourselves and other members of the committee, appear to have been satisfactorily cleared up. We feel that you have done an excellent job on this bulletin, particularly in view of the fact that, as Mr. Mueller states, it was prepared in a hurry. The scope of vision and perspective of the entire fluorescent picture shown in this report is certainly one with which the entire industry should be glad to cooperate to the fullest extent."

Mr. Bremicker added:

"* * * we would like to say that the portion covering advertising is excellent, provided that the lamp companies carry out their part of the agreement. We do not say this merely to be suspicious, but because of the fact that we have just received certain publicity from both the Westinghouse Lamp Co. and the

Digitized by Google

General Electric Lamp Co., which apparently fail to live up to some of these promises."

The specific examples mentioned by Mr. Bremicker are advertisements which do not state the wattage lost because of the auxiliary unit and which do advertise fluorescent lamps for general illumination, "which we understand had been reported to the General Electric Co. as objectionable."

There was a meeting of the lighting sales committee of the E. E. I. in New York July 13, 1939. At this meeting—

"Mr. Howard Sharp submitted the next draft of the fluorescent lighting report and questionnaire based on the criticisms recently received from members of the committee. Very few additional suggestions for changes were made. On several parts of the report where it was thought the statements might be controversial or which might provide some chance for the lamp manufacturers' representatives to say 'that is not what we agreed to,' it was felt that these should be checked with the manufacturers and these points agreed upon. This was done Friday morning" (exhibit 36).

There was an additional meeting between members of the E. E. I. lighting sales committee and officials of General Electric and Westinghouse on July 14, 1939, in New York City. At this meeting "it was stated that the utility group was now at work upon a report which was to be submitted to the E. E. I. for adoption. Certain portions of the report were read by Mr. Sharp and discussed with representatives from the lamp manufacturing companies" (exhibit 37).

On or about August 1, 1939, the lighting sales committee—

"* * * brought the results of the conferences with the major lamp companies to the attention of all those utilities who answered the first fluorescent lighting questionnaire. A questionnaire also accompanied these interim notes to determine the utilities' attitude toward the plans and equipment discussed" (exhibit 4).

The questionnaire (exhibit 38) asked such questions as:

"Will the changes in policy affecting advertising and promotion be constructive and help to eliminate misconception on the part of the public; * * * Why?"

The preamble of this questionnaire reads:

"It is recognized that many of the items contained in the attached progress report are proposed changes in policy or planned developments. Consequently the answers to the following questions should be based on the assumption that all proposed changes in policy will be enforced, and that the developments will be forthcoming."

The responses of the utilities to the questionnaire were presented to the E. E. I. member companies in a report entitled "Recent Developments in Fluorescent Lighting and Recommendations for the Immediate Future" (exhibit 39). The introduction of this report reads in part:

"In the interval since the publication by the lighting sales committee of a survey entitled 'Current Practice in the Promotion and Application of Fluorescent Lamps,' dated April 1939 and hereafter referred to as the 'April report,' a number of developments have taken place, which it is believed are important for the successful application of fluorescent lamps. These developments have been thoroughly discussed individually and collectively by the representatives of the large lamp companies and various utilities. However, the full cooperation of responsible lighting interests throughout the country is essential if the anticipated benefits are to be obtained."

In the publication entitled, "Plain Talk About Fluorescent Lighting" (exhibit 4), by Messrs. Mueller, Sharp, and Skinner, announced at the annual meeting of the A. E. I. C., held January 15 to 19, 1940, the authors state that the report "Recent developments in fluorescent lighting and recommendations for the immediate future," indicates—

"* * * that utilities are almost unanimously in favor of the progress made and the planned changes in policy. However, the study also shows that a number of the utilities because of local experience, had some doubts that the lamp companies would or could carry out all the proposed changes."

The authors continue:

"Regardless of skepticism, the utilities have a real responsibility in maintaining their local leadership and in exerting coordinated pressure nationally."

In Plain Talk About Fluorescent Lighting it is also stated that—

"Immediately following the publication of the Edison Electric Institute report in March 1939 unofficial conferences were begun by utility lighting men, a representative of Electrical Testing Laboratories, on certification procedure, and representatives of the large lamp companies in an effort to reconcile the wide differences in opinion. A number of these meetings were held, one in Chicago, one in

Digitized by Google

Cleveland, and two in New York. It was evident from the start that the technical aspects of lamps and applications would have to be agreed upon before promotion and sales could progress, and in retrospect it is clear that unless these engineering phases had been given preference, the breach between manufacturers and utilities would have been widened even further. The natural conservatism of technical men was needed to retard the tremendous hurry of the promotional minds in order to provide time in which the many details with respect to equipment and application could be worked out for the customers' benefit.

"From these conferences a number of developments have taken place, some of the more important of which are as follows:

"POLICY STATEMENTS

"The large lamp companies issued statements of policy concerning the promotion of fluorescent lamps, and gave them wide publicity. While of necessity they have been in general terms they have served as a stabilizing factor."

The publication continued to outline the policies for the promotion of the fluorescent lighting decided upon by the utilities and the Mazda lamp manufacturers at their conferences.

On March 19, 1940, a meeting of the general sales committee of the E. E. I. was held, and at that meeting it was agreed that "utilities will oppose advertising of fluorescent which stresses reduced cost of electricity and minimizes better illumination" (exhibit 40).

A special session of the annual sales conference of the E. E. I. was held in Chicago on March 22, 1940, for the purpose of discussing fluorescent lighting. Present were representatives of the Mazda lamp companies, Hygrade, several future manufacturing companies, as well as representatives of various utilities. The meeting was referred to as an "industry conference on fluorescent lighting" (exhibit 41).

In early March 1940 the Mazda lamp manufacturers advised the lamp subcommittee, the lighting sales committee of the E. E. I., that it wished to hold a meeting with them at Nela Park. On March 15, 1940, Mr. Millar, chairman of the lamp subcommittee, wrote Mr. Charles Munroe, of the Detroit Edison Co., as follows:

"Your reminder of March 13 that I have not communicated concerning the agenda for our subcommittee meeting in Nela Park was unnecessary because the matter is on my mind and conscience. Crossing your letter in the mail was my circular about collecting data of exemplary fluorescent lighting installations. This, however, is incidental to other matters. I am unable to state the principal purpose of our meeting other than to say that the lamp manufacturers desire to discuss affairs with us and that I believe that the topics will be of sufficient importance to warrant our going to Nela Park" (exhibit 42).

The proposed meeting was held at Nela Park on March 27, 1940 (exhibit 43). Those attending included Messrs. Gear, Millar, Munroe, and Regar, of the subcommittee; Messrs. Kewley, Sloan, Harrison, Boynton, and Potter, of General Electric; and Messrs. Houngholm and Snyder, of Westinghouse.

At a conference of utility executives held by Westinghouse at Bloomfield, N. J., on June 17, 1940, Mr. O. P. Cleaver, commercial engineering department, Westinghouse, delivered a talk entitled, "Fluorescent Lighting: The Public Utilities New Problem Child" (exhibit 44) in which he rhetorically asked, "Can the fluorescent lamp be used as a means of raising * * * [the consumption of electricity] * * * out of the big gully?" He remarked, "That's what all of us would like to know at this state in our statistical survey." After showing that if fluorescent lighting were used only for high-intensity lighting it would add to the loads on the utilities' lines, Mr. Cleaver concluded that, "Something has to be done about this problem child of ours, before all this can happen. * * * statistics show us how bad an 'actor-upper' he is."

On July 31, 1940, General Electric informed Mr. Millar, chairman of the lamp subcommittee of the A. E. I. C. and president of E. T. I., that it would be desirable to hold another conference of representatives of the Mazda lamp manufacturers and utilities, "in order to discuss the progress that has been made and give consideration to the promotion of the higher wattage fluorescent lamp which will be made available this fall. The time and place selected for this next conference is Monday, August 26, at Nela Park" (exhibit 45). Representatives of Westinghouse were invited to attend (exhibits 46 and 47). The meeting was probably held, but we have no record of what transpired.

Digitized by Google

At the sales executive conference of the A. E. I. C. held between September 30 and October 3, 1940, at Hot Springs, Va., Mr. Mueller presented a report entitled "Today's Fluorescent Lighting Situation" (exhibit 5). At this conference there was "a great deal of discussion of the problems presented to the utility companies by the rapid development of fluorescent lighting (exhibit 48).

2. *Pursuant to the decisions made between the utilities and the Mazda lamp manufacturers at their various conferences, the Mazda lamp manufacturers have refrained from advertising that fluorescent could be used to save electricity and have attempted to prevent this fact from coming to the attention of the public*

There are numerous examples:

On May 24, 1939, Mr. Sharp, of Buffalo, Niagara, wrote Mr. Harrison that utility men had complained to him concerning a display in the General Electric Building at the New York World's Fair. This display purportedly consisted of a 20-watt fluorescent lamp and a 20-watt incandescent lamp with a foot candle meter which showed how much more light was given by the fluorescent lamp than by the incandescent lamp. A sign accompanied the display which read to the effect, "See the difference between equal wattages of fluorescent and Mazda [incandescent] lighting" and the foot candle meters evidently showed "dramatic differences" in the quantity of light. Objecting to General Electric having this display on exhibit in their building at the World's Fair, Mr. Sharp stated:

"If this demonstration is as explained to me, I think it does violate the spirit of the understanding that our group had in Cleveland. As a matter of fact, I would think it violated the fundamental concept of the lamp department that advances in the lighting art should not be at the expense of wattage but should give the customer more for the same money. I hope you can find a way to change this exhibit, so that it does not give misleading impressions to the crowd who will see it" (exhibit 49).

Mr. Harrison replied to Mr. Sharp that it had not been intended that the exhibit should demonstrate the amount of electricity which could be saved by the use of fluorescent lamps, and that the exhibit was being withdrawn (exhibits 50 and 51).

On May 20, 1940, when the General Electric Supply Corporation published a calalog listing and picturing fixtures unequipped with shielding, the lamp division objected on the grounds that "it is almost exactly what the General Electric Co. has agreed not to do and it is what the central stations intend to combat as indicated by their formal declaration of policy" (exhibit 52). The Supply Corporation justified the form of its advertising on the grounds that it was necessitated by Hygrade Sylvania competition (exhibit 53), but the lamp division persisted in its objection to picturing fixtures not equipped with shielding and urged that if it were necessary to sell nonshielded fixtures the price of such fixtures should be indicated only by note on the catalog's price schedules to the effect that if the fixtures listed were ordered without shielding their price would be so much less (exhibit 54).

General Electric does not satisfy itself with merely not itself advertising nonshielded lamp fixtures but causes other companies, whose lighting sales policies it has a part in dictating, to refrain from selling nonshielded fixtures. Thus, when Graybar Electric Co. prepared some advertising copy containing illustrations of nonshielded fixtures, and submitted such copy to General Electric for approval, the lamp department informed Graybar that it was reducing "the number of fixtures to be illustrated from the original list of 27 to approximately 18." Some of these fixtures were ruled out due to the engineering department's disapproval of bare lamp equipment. As you know, bare tube fixtures do not fit in with the standards of lighting practice which we are promoting (exhibit 55).

3. *At the conferences between General Electric and Westinghouse and the Utilities it was also decided that General Electric and Westinghouse would work to have all fluorescent lamps operate on high-power factor*

On January 11, 1940, Mr. Ward Harrison, of the General Electric lamp division, wrote that "it is true that the lamp department has promised the utilities to feature high-power factor in advertising" (exhibit 56).

Subsequently at a meeting at Boca Raton, Fla., on January 18, 1940, officials of the lamp department and officials of certain utilities came to an understand-

Digitized by Google

ing as to what should be the wording of the announcement with respect to power-factor correction which General Electric should make to the public (exhibit 57). As a result of this conference it was decided, and Messrs. Kewley and Harrison promised, that the statement would read as follows: "General Electric Mazda lamps are recommended for use only with equipment providing good power factor" (exhibit 58).

General Electric and Westinghouse have continuously in their advertisements stressed that fluorescent lamps should be used only with equipment giving high-power factor.

4. *The members of the Lamp Committee of the E. E. I. and of the Lighting Sales Committee of the A. E. I. C. and officials of various utility companies have engaged in extensive policing of the fluorescent advertising and promotional material of the Mazda manufacturers in order to make sure that they not deviate from the basis upon which it was agreed at the various conferences that fluorescent lighting should be promoted*

On December 15, 1939, Mr. J. L. McEachin, commercial sales manager of the Minnesota Power & Light Co., Duluth, Minn., wrote to Mr. G. E. Nelson, manager of the northern division of the incandescent lamp department of General Electric, complaining about General Electric advertising in the Electrical Contracting Magazine for December 1939 (exhibit 59).

On December 18, 1939, Mr. J. E. Lynch, of the Minnesota Power & Light Co., wrote to Mr. R. H. Fite, of the Electrical Bond & Share Service, Inc., as follows:

"On Friday last, we were favored with a visit from Mr. Ed Stryker, Cleveland, and Mr. George Nelson, Minneapolis, who endeavored to explain away why it is some departments of General Electric Co. can advertise untruthfully and mislead the public generally on this rather delicate subject and the lamp department has need only to send out such an individual as Mr. Stryker in the capacity of fire extinguisher and everything should be well. * * * It has been necessary to advise them that future moves are theirs and that from now on our policy may be to go along with the lamp company which is endeavoring to handle such an important matter in the proper manner" (exhibit 60).

On January 8, 1940, Mr. R. H. Fite replied to Mr. Lynch and stated:

"Apparently through some misunderstanding or lack of proper coordination between the respective divisions of the General Electric Co., the Schenectady Advertising Department [of General Electric] is still on the wrong track. We agree with you that this matter is really serious * * *" (exhibit 61).

Mr. Fite advised Mr. Lynch to continue to cooperate with General Electric in their territory. Otherwise, the lighting business of the Minnesota Power & Light Co. "might be adversely affected."

On January 3, 1940, Mr. Sharp wrote to Mr. A. L. Powell, supervising engineer, lamp department of General Electric, objecting to Mr. Powell's articles in Lightings and Lamp because Mr. Powell had stated that "there is a very definite trend toward direct lighting as an offset to the low total luminous output of fluorescent tubes" (exhibit 62).

On January 22, 1940, an official of the Carolina Power & Light Co., of Raleigh, N. C., wrote Mr. Cleaver, of the commercial engineering department of Westinghouse, a letter commenting on an advertisement of Hygrade that "fluorescent lighting for general illumination is here today." The letter inquires whether, "Your big company intends to do those things which Hygrade is scheduled to do." The letter further states:

"You, of course, realize that in many instances the wattage will be cut to one-third as fluorescent replaces incandescent installations. There is considerably more at stake this year than there was at the time the incandescent replaced the carbon [filament lamp]—so much more that we are beginning to wonder" (exhibit 63).

On July 17, 1940, a district manager of General Electric Supply Corporation, Mr. R. D. Glennie, and Mr. Booth and Mr. Sharp, of Buffalo, Niagara Electric, met and discussed the fluorescent situation. At this meeting Mr. Sharp complained about the increased sales of fluorescent lamps in such a way as to decrease the amount of electricity consumed. On July 18, 1940, in respect to this conference Mr. Glennie wrote Mr. Sharp that he believed that it was the sale of fluorescent lamps through contractors that was causing the trouble. Mr. Glennie proposed that if Mr. Sharp thought it a good idea they would have a meeting with the contractors at the end of August in order to guide their activities. He proposed that the General Electric Supply Corporation should go through its

Digitized by Google

records and get the names of the contractors who were pushing fluorescent lighting. He stated that it was to "our interest to work together because we have a reputation at stake, which we are jealously guarding, and we are endeavoring to operate at a profit. You, too, are endeavoring to keep your customers happy and you must protect your load. Therefore our problems are one and the same" (exhibit 64).

5. *The utilities assist General Electric and Westinghouse in obtaining and maintaining control over the manufacture and sale of fluorescent lamps and equipment for their operation by selling and promoting Mazda fluorescent lamps almost exclusively and by supporting the efforts of General Electric and Westinghouse to obtain and maintain control over the manufacture and sale of fluorescent lamps and equipment for their operations*

Hygrade has been very active in the fluorescent lighting industry from its inception, energetically promoting the use of fluorescent lighting, and obtaining a strong position for itself in the electric lamp industry through developing a large business in the manufacture and sale of fluorescent lamps. The Mazda lamp companies have sought to keep Hygrade down in the fluorescent lamp field because they fear that Hygrade's development in this field would weaken their control of the electric lamp industry. The utilities have worried over Hygrade's aggressive methods in promoting the use of fluorescent lighting, largely because the utilities oppose any sponsorship of fluorescent lighting which does not limit fluorescent lighting to those fields where wattages will not be reduced, but also because of their fear that it would be more difficult to control the activities of a non-Mazda company.

The utility companies have persisted in attempts to put pressure on Hygrade in order to cause Hygrade to desist from its aggressive sales method. Thus, on April 6, 1940, Mr. Bremicker, a member of the lighting sales committee of the E. E. I. and manager of the lighting sales department of the West Pennsylvania Power Co., wrote Hygrade, stating that his company did not wish to demonstrate a new model Hygrade fluorescent unit (exhibit 65). The reason for the refusal to demonstrate was stated as follows:

"An important consideration in the desirability of obtaining fluorescent equipment for demonstration purposes is the sales policy of the manufacturer of the equipment involved. It has been our policy, and we believe generally the policy of utilities throughout the country, to support and promote the sale of fluorescent equipment made by companies whose sales policies truthfully report the merits of their equipment and whose literature and advertising, and particularly that promotional material placed in the hands of their representatives, promotes the sale of fluorescent lighting in accordance with accepted fundamental lighting principles as embodied in the better light-better sight movement. It is our feeling that your sales policy and promotional material do not meet these requirements. We realize that you apparently have made a genuine effort to cooperate with utilities in the earlier stages of fluorescent lighting, particularly with respect to power factor correction, and we trust that you have a sincere desire to correct the objectionable features of your present operations. For this reason we are pointing out certain specific points which we consider objectionable and would greatly appreciate your reactions."

The specific points concern the advertisement of the statement that fluorescent lighting gives "several times more light," and the advertising of "bare" fluorescent lamp fixtures which employ no diffusing medium. The latter concludes:

"With the above facts in mind, we think you will understand why we are not interested in spending any money for Hygrade demonstration equipment until we are satisfied that your company intends to cooperate with us in selling fluorescent lighting properly designed and properly applied."

The character of the correspondence between members of the lighting sales committee of the E. E. I. concerning Hygrade's method of promoting fluorescent lighting and the attitude of the utilities toward Hygrade prompted Mr. Mueller, chairman of the lighting sales committee of the E. E. I. to send, on May 7, 1940, to the members of the committee a copy of a letter sent him on May 6, 1940, by Mr. C. E. Greenwood. Mr. Greenwood's letter reads:

"Some interesting correspondence has come across my desk on the subject of Hygrade fluorescent lighting units and I am prompted to call your attention to one important point which was brought out in Marshall Waterman's letter to you under date of April 24. He states "Obviously any preview of this kind cannot be an official matter either with respect to E. E. I. or even with respect to the

Digitized by Google

companies involved, but must remain purely a matter of personal suggestions from lighting directors to the manufacturers.

"This becomes doubly important in view of the feeling at this time that exists between Hygrade and the R. L. M. group. Mr. Lowell and one of his company representatives spent over an hour with me recently and there is a definite resentment indicated in the way they feel they are treated as compared with the so-called Mazda group.

"As I have brought out on numerous occasions, no organizational committee, nor any member of it, has any right to discuss authoritatively the policies of E. E. I. I am offering the suggestion that in writing to Hygrade the members of your committee be certain that they identify themselves with affiliation in their own company and then in any antitrust investigation or other troubles we will not find letters being brought up that might involve the institute.

"I am advising you of the situation so that you may judge your procedure accordingly" (exhibit 66).

On May 29, 1940, Hygrade, through Mr. W. P. Lowell, of its commercial engineering department, invited the members of the lighting sales committee of the E. E. I. to a conference to be held on June 11, 1940, for the purpose of discussing Hygrade's sales, and promotional policies of fluorescent lighting (exhibit 67). It is not known whether or not this conference was held, or if the conference was held, whether or not Hygrade succeeded in persuading the utility men present to adopt a less unfavorable attitude toward Hygrade.

Referring to the activities of Hygrade in the fluorescent lighting industry in his report "Today's fluorescent lighting situation" (exhibit 5), presented at the sales executives' conference of the A. E. I. C. held between September 30 and October 3, 1940, at Hot Springs, Va., Mr. J. E. Mueller stated that—

"Another consideration which has the necessary potential for developing into a major problem is the apparent realinement of forces that is taking place among the lamp bulb manufacturers.

The largest non-Mazda manufacturer (Hygrade) claims to have basic patents for the manufacture of fluorescent lamps, and does not recognize the patents held by the Mazda companies. This is at the present time in the process of being decided by the courts. This realinement of forces, together with the competitive situation which attends it, might lead to methods and activities which could disorganize the whole lighting market to the detriment of the public and he utilities who are standing on the sidelines.

"For example, apparently the non-Mazda company, with its fixture activities, is capturing a sizable portion of the market. This is claimed by them and admitted by the Mazda people. The non-Mazda concern has, of course, captured this share of the market by aggressive merchandising. This has meant a quick assembling of a direct sales force as well as the addition of large numbers of dealer and distributor salesmen. Expansion here has been so rapid that training has lagged their sales efforts, which has led to "gadget" rather than lighting selling, and the use of questionable sales methods, particularly in certain areas. Their management is aware of this situation, and is taking steps to correct it. However, here again there is a wide divergence between management and field operation.

"There are some indications that, in an effort to combat this competition, the Mazda companies are suggesting similar methods to their distribution channels. So far, any rapid expansion of old-line jobber sales forces putting on large numbers of poorly trained fluirescent lighting salesmen for direct customer selling has been limited to isolated areas. However, if this practice grows to too great an extent, and sound training and promotional methods are allowed to lag sales efforts, this can lead to a serious situation which can upset the structure for industry cooperation."

Because of Hygrade's treatment by the utilities, Mr. E. J. Poor, president of Hygrade, addressed a memorandum, dated December 13, 1940, to the Department of Justice in which he stated:

"Hygrade Sylvania Corporation for the past 2 years has been advertising nationally the fact that it is one of the foremost companies in the manufacture and sale of fluorescent lighting equipment and, in addition, through letters and contacts through salesmen, has brought this fact to the attention of all the large electric light and power companies. Hardly without exception, those companies know from attempts to interest and sell them Hygrade tungsten filament lamps during the past 10 years or more, that the quality of Hygrade products is at least equal to that of any other company and, in general, its prices are lower, representing a real saving to the purchaser.

Digitized by Google

"In spite of these facts, the large lighting and power companies such as the Detroit Edison Co. of Detroit, Mich.; Standard Gas & Electric Co., of Chicago, Ill.; Commonwealth Edison Co. of Chicago, Ill.; and a great many others, have not placed orders for either tungsten filament or fluorescent lamps with Hygrade Sylvania Corporation but have, without exception, favored the so-called Mazda lamp manufacturer whose sales represent 80 percent of the total requirements in this field.

"Companies such as Boston Edison Co., of Boston, Mass.; Central Hudson Gas & Electric Corporation, of Poughkeepsie, N. Y.; New England Power Co., of Boston, Mass.; Consolidated Edison Co., of New York; and West Penn Power Co., of Pittsburgh, Pa., and a few others who have placed with Hygrade a very small percentage of the total light and power companies' lamp business, have been well pleased with the quality and service from Hygrade on incandescent lamps and have made a worthwhile saving through their purchases" (exhibit 68).

6. *One of the principal subjects, in addition to those described in detail in this report, discussed at the meetings between the utilities and the Mazda manufacturers was the organization of manufacturers of fixtures and auxiliary equipment for fluorescent lamps into associations which would be subject to regulation by General Electric and Westinghouse and which would be used as a means of extending the control of General Electric and Westinghouse over the manufacture and sale of fluorescent lamps and which would, at the same time, be used as a means of promoting fluorescent lighting so that it would not be used as a means of decreasing consumption of electricity and would be used only with equipment providing high power factor.*

Pursuant to the conferences between the utilities and the Mazda companies, two associations were promoted to organize the manufacturers of fluorescent lighting fixtures and manufacturers of fluorescent light equipment including ballasts and starting switches. One of these associations, the Fleur-O-Lier, consists of manufacturers of lighting fixtures for "commercial" installations and the other association, the Reflector Lamp Manufacturers Institute (commonly referred to as the R. L. M.), consists of manufacturers of fixtures for industrial installations. The two Mazda lamp manufacturers, or so it is given out to the industry, prepare specifications for fixtures, ballasts, and starting switches, and it is the essence of the Fleur-O-Lier and R. L. M. programs that manufacturers desirous of participating in either or both of the programs and of attaching the Fleur-O-Lier or R. L. M. labels to his fixtures, ballasts, or starting switches, must make his product according to, and have it certified as meeting the specifications applying to it. The E. T. L. tests the fixtures, ballasts, and starting switches to determine that they meet the specifications and awards the certifications. Although it is publicly announced that the specifications are prepared by the Mazda lamp manufacturers, the specifications are in fact submitted by the Mazda lamp manufacturers to the utilities for their approval and revision before the specifications are officially furnished to E. T. L.. The specifications are prepared in accordance with the interests of the utility companies, both in that they provide that fixtures and ballasts will be power factor corrected and in that they are designed to insure that fixtures complying with them will not be used to reduce electricity consumption. No specifications were issued for portable fixtures, such as desk lamps, which might be used to reduce electricity consumption. In the interests of General Electric and Westinghouse, the Fleur-O-Lier and R. L. M. programs are employed to secure to those companies a monopoly of fluorescent lamps and control over the manufacture and sale of ballasts and starting switches. For example, General Electric and Westinghouse require fixture manufacturers in the Fleur-O-Lier and R. L. M. associations to affix to their fixtures labels, which are so worded as to induce the use in such fixtures of fluorescent lamps manufacturered by General Electric and Westinghouse.

The Mazda lamp manufacturers and utilities have promoted the Fleur-O-Lier and R. L. M. associations in order to enable them to control the manufacture, sale and use of fluorescent lamps, ballasts, and starting switches and, therefore, they have sought to compel and cause all fixture, ballasts and starting switch manufacturers, except those whose competition they wished to eliminate, to participate and join the associations. To this end both the Mazda lamp manufacturers and the utility companies have supported, promoted, and fostered the manufacture, sale and use of Fleur-O-Lier certified and R. L. M. certified fixtures, ballasts, and starting switches and have discouraged, hindered, and suppressed the sale of such equipment not having Fleur-O-Lier or R. L. M. certification. The Mazda lamp manufacturers and the utilities' efforts to this end have

Digitized by Google

been very successful: It is estimated that 85 percent of all fluorescent lighting fixtures for industrial installations are manufactured by R. L. M. manufacturers, and the Fleur-O-Lier Association now consists of about 30 manufacturers who make the majority of all fluorescent lighting fixtures for commercial installation.

The public, despite the concerted efforts of the Mazda lamp manufacturers and the utilities, has found out that fluorescent lamps can be used as a source of general illumination and that their use as such is more economical than use of incandescent lamps.

The fact that the efforts of the Mazda lamp manufacturers and utilities to stifle the development of the fluorescent lighting industry and to keep from the public the fact that fluorescent lighting can be used to save on electricity bills has not been completely successful is largely due to the activities of Hygrade in energetically promoting and publicizing fluorescent lighting. Hygrade commenced manufacturing fluorescent lamps almost as early as General Electric and Westinghouse and, despite the efforts of General Electric and Westinghouse and the utilities to prevent it, Hygrade's business in these lamps has continuously grown and developed. At the present time Hygrade is selling large quantities of fluorescent lamps which are being extensively used to illuminate defense plants and buildings being employed in our war effort. But an effort to regulate even this supply is now in the making.

General Electric has sought to restrict the number of fluorescent lamps which Hygrade should sell by causing Hygrade to sign an agreement whereby it would be licensed by General Electric to make fluorescent lamps and would be entitled to manufacture only a limited, small number of lamps based upon a quota set by General Electric. This effort failed, and because the activities of Hygrade in the fluorescent lamp industry has prevented General Electric and Westinghouse from getting control of the fluorescent lighting industry and has thwarted to some extent the efforts of General Electric and Westinghouse and the utilities to regulate the use of fluorescent lighting, General Electric has instituted suit against Hygrade under certain fluorescent lamp patents which it purchased. By this suit it is seeking to have Hygrade enjoined from continuing to manufacture lamps. If the suit succeeds, General Electric and Westinghouse and the utilities will undoubtedly be left in complete control of the fluorescent lighting industry, and will then be able to completely control the use of fluorescent lighting on the basis decided upon by General Electric and Westinghouse and the utilities.

EXHIBIT NO. 3

STATEMENT SUBMITTED BY HON. THURMAN ARNOLD REGARDING STANDARD OIL CO. AND THE DEVELOPMENT OF SYNTHETIC RUBBER

Perhaps the best criterion to use in judging the merits of S. 702 is to assume that it had been enacted and in operation prior to the present war. A good case can be made for the proposition that it was due primarily to the absence of a well-established technical organization such as is contemplated by this bill that the country finds itself in its present plight. Particularly in the field of synthetic rubber is this so. Looking back over the history of the rubber problem in the last few years, one of the most obvious shortcomings in the handling of the program is that of the absence of technical knowledge on the part of Government agencies and officials dealing with the problem.

Documents in the files of the Department of Justice, many of which have been placed on record in the various hearings before Senate committees, tell a story that is tragic as one contrasts it with what might have been. The synthetic-rubber story is largely one of the relationship of I. G. Farben, Standard Oil Co. (New Jersey) and certain other companies which negotiated with one or both of them. Briefly that story is as follows: I G. Farben developed the Buna type of synthetic rubber in the latter part of the 1920's. It made a series of agreements with Standard Oil (New Jersey) in 1929, one of which contemplated the domination by I. G. Farben of the future chemical developments sponsored by the two companies working together. A joint company for the exploitation of certain chemical processes was organized in 1930. An abortive arrangement for testing and working with the Buna rubber was made by the joint company and the General Tire & Rubber Co.

Goodrich and Goodyear were both experimenting with synthetic rubber and during the 1930's both companies made strenuous efforts to procure from I. G.

Digitized by Google

Farben and Standard an arrangement which would permit their participation in the development and exploitation of the Buna patents.

In 1938 the pressure from these companies became so strong and the threat of their going ahead independently of I. G. Farben and Standard so imminent that I. G. Farben and the Hitler government were induced to give some indication of willingness to permit exploitation of the Buna patents in this country. An official came to the United States in the fall of 1938 and under the auspices of Standard contacted all the large rubber companies. They were given to understand that the German Buna would be made available to them. In the spring of 1939 an expert was sent over to instruct the rubber companies in the processing of the German Buna and samples were sent to the various companies for making test tires. The know-how on making the synthetic rubber itself was not given to anyone outside Germany because the Hitler government prohibited it.

The thing which had caused some relaxation in the Hitler policy of not permitting any exploitation of the Buna patents in this country was an agreement made between Standard officials and I. G. Farben officials in Berlin in the spring of 1938. In order to persuade I. G. Farben to try to procure the consent of the Hitler government for exploitation here of the Buna patents Standard gave I. G. Farben and hence Germany a full disclosure of its own synthetic rubber process for making Butyl rubber and also supplied samples. On receipt of this information, I. G. Farben agreed tto do what it could do to persuade the Hitler government to relax its prohibition against exploitation outside of Germany of the Buna rubber. When consent was obtained in the fall of 1938 the official came over as previously stated. The war broke out before any further steps were taken to supply the German Buna rubber to American processors.

In September 1939, shortly after the out-break of the war, Standard and I. G. Farben officials met at the Hague. Arrangements were made for Standard to take over the exploitation of the buna and other I. G. Farben patents in United States, Great Britain, and France. By this transaction the independent development of synthetic rubber was made much more hazardous than it would have been had no such transaction taken place. If the buna patents had remained in the name of I. G. Farben the rubber companies of this country would have had little to fear in the way of harassing infringement suits. It is quite certain that the courts would not lend themselves to the suppression of the production of vital war material at the suit of patentees who were nationals of the countries we are arming against. By assigning their patents to Standard, I. G. Farben made it possible not only to attempt to avoid seizure of the patents by the Alien Property Custodian but immediately injected a threat of infringement into the picture which otherwise would not have existed. Nor was it a mere threat. In October just a few weeks before Pearl Harbor, Standard's subsidiary, Jasco, sued the Goodrich subsidiary, Hycar Chemical Co., to enjoin the latter from making synthetic rubber because of an alleged infringement of the I. G. Farben patents which had been assigned to Standard. Goodyear was notifled of the possibility of a similar suit against it. Thus a short time before Pearl Harbor the assignee of the I. G. Farben patents, which was not itself manufacturing synthetic rubber, was not in any position to manufacture large amounts of synthetic rubber for tires and similar uses was attempting to block the manufacture by American rubber companies which had for nearly a decade been attempting to participate in the synthetic rubber program.

Having made disclosure of its information concerning butyl rubber to the Germans, Standard continued working on its development with no disclosure to others in this country. Although its technical and commercial employees realized the desirability of working with a rubber company to facilitate its development the management refused to permit this and it was not until the summer of 1940, more than 2 years after the disclosure to the Germans, that arrangements were made with Firestone and United States Rubber for testing butyl rubber for tires. The tests then made were intended to determine whether reasonably satisfactory pasesnger tires could be made of butyl rubber. It was the conclusion after a few weeks of testing that a fairly satisfactory tire could be made from butyl rubber and that superior inner tubes could be made from it. And yet the first plant for producing butyl rubber on a commercial scale has been put in operation within the past month.

In June 1940, Vice President Wallace, then Secretary of Agriculture, told the agricultural subcommittee of the Senate Appropriations Committee, "The current price (of natural rubber) is perhaps 24 cents per pound; but I think with those

Digitized by Google

improved strains undoubtedly it will be possible to produce it for less than 12 cents a pound. And frankly, I do not think any of the synthetic rubbers can meet a price of 12 cents a pound." He was familiar to some extent with butyl rubber because its coinventor, W. J. Sparks, had left the employ of the Standard Oil Development Co. and was employed at the Northern Regional Research Laboratory of the Department of Agricultural at Peoria, Ill. What Mr. Wallace and possibly Mr. Sparks did not know was that butyl rubber was one type of synthetic which could be produced for less than 12 cents a pound, the rock-bottom price of crude rubber. Just 2 weeks before Mr. Wallace made his statement to the Senate committee Standard's engineers had submitted cost figures indicating a probable production cost of butyl rubber in a 300-ton-per-day plant of 6.6 cents per pound. Ten percent depreciation would add only slightly more than 1 cent per pound. A few months later on November 27, 1940, the same engineers estimated production cost of butyl in a 50-ton-per-day plant at 5.72 cents per pound, exclusive of depreciation and 7.07 cents with 10 percent depreciation.

Butyl rubber is unquestionably the cheapest of all synthetic rubbers and has already demonstrated its usefulness. One of the small number of tires which have been made from it has run 25,000 miles at speeds up to 50 miles per hour. Inner tubes made of it are superior to natural rubber tubes because practically no air is lost through the wall of the tube. For gas masks and barrage balloons it is also superior. Flotation gear such as life rafts for airplanes is inflated by releasing carbon dioxide. Butyl rubber is nearly 60 times as impermeable to carbon dioxide as is natural rubber.

From the foregoing it seems clear that the plight we are in with regard to shortage of synthetic rubber is largely due to Government agencies not having information which was known to private companies and part of which had been given to Germany.

If such an organization as the proposed Office of Scientific and Technical Mobilization had been functioning in 1940 and 1941 things might well have been different. Goodrich and Goodyear both were anxious to have a large development of synthetic rubber in this country and concerned by the restrictions which Standard was placing upon them could have gone to the Office of Scientific and Technical Mobilization with confidence that something would be done about the matter. W. J. Sparks, coinventor of butyl rubber, who had left Standard to take Government employment when the company failed to push development of butyl as he thought it should, would have had a logical agency to turn to in his advocacy of butyl rubber.

The various Government agencies such as the Office of Production Management, Office for Emergency Management, War Production Board, Rubber Reserve Company, and the Office of the Rubber Director which have dealt with the rubber problem could have looked to a trained body of Government technicians for factual information. Instead, they have been forced to get their facts from officials of private companies which are vitally concerned in the policies which will be predicated on such facts.

EXHIBIT NO. 4

STATEMENT OF WALTER R. HUTCHINSON, SPECIAL ASSISTANT TO THE ATTORNEY GENERAL, BEFORE THE SENATE COMMITTEE ON PATENTS, APRIL 20, 1942

SECTION I. INTRODUCTION

It has been proposed to examine patent abuses which have hampered the development of the plastics industry. However, the plastics industry is composed of dozens of large firms manufacturing scores of different kinds of plastics so that an adequate survey of patent abuses in this field would consume too much time to be practicable for the purposes of this inquiry. For this reason the Antitrust Division wishes to present a case history of an investigation made in one field of plastics, hoping thereby to illustrate a patent pattern which is known to be prevalent among many other types of plastics.

Before taking up the patent history of the case selected, we propose to outline very briefly the scope of the plastics industry as a whole.

It has been estimated that the total output of all plastics during 1941 was about 300,000,000 pounds representing an aggregate value of approximately $500,000,000. The industry has developed tremendously in the last 10 years and many industrial experts look to plastics not only to substitute for many critically

Digitized by Google

short metals during this war, but also to supersede metals, glass, and wood for many uses after the war.

The war effort is relying heavily on plastics for such implements of war as the following: Navy mosquito boats made of laminated phenol formaldehyde plastic, parachute flares, crash helmets for use by the Tank Corps, windbreakers, i. e. tips on shells, bayonet sheaths, gun stocks, and bayonet handles. These are merely some of the war needs for which plastics are being utilized.

Now let us consider the facts developed by the Antitrust Division's investigation into one of these plastics, namely, methyl methacrylate.

In the course of this investigation the Antitrust Division discovered there existed five corporations, two American, one English, and two German, which were linked by a series of secret cartel agreements. Before presenting the evidence of their activities, we wish to give a brief thumbnail sketch of these corporations for purposes of identification.

(1) Röhm & Haas Co., Inc., of Philadelphia, Pa. (hereinafter sometimes referred to as Philadelphia or R. & H.), a company organized under the laws of Delaware about 1917, is engaged in the manufacture of various chemicals and chemical products, including particularly acrylic resins. The history of this company dates back to the early 1900's at which time Dr. Röhm, a scientist, and Mr. Haas were partners in a chemical business in Germany. Subsequently Mr. Haas came to the United States and organized a partnership to exploit the chemical industry with products developed by Dr. Röhm in Germany. Dr. Röhm expressed interest in the acrylic resin field prior to the last war, but it was not until after that time that he applied for United States patents on his inventions. The patents which issued were licensed or assigned exclusively to Röhm & Haas Co. which was also engaged in experimentation for the purpose of promoting development in this field. Through the cooperation of the two firms Röhm & Haas Co. is probably the leading producer of acrylic plastics in this country.

(2) Resinous Products & Chemical Co., Inc., of Philadelphia, Pa., organized under the laws of Delaware in 1926 is a company engaged exlusively in manufacture of synthetic resins. The officers of this company are identical with those of the Röhm & Haas Co., and the majority interest in the capital stock is owned personally by Mr. Haas. This company holds exclusive licenses from a German and American chemical company under United States patents covering manufacture of probably the best synthetic resin used as a laminating bond in production of plywood. Plywood is being used extensively by British and German firms in production of aircraft. Production of plywood planes for use as military transports has been started by one of the largest United States aircraft producers, as a short cut to providing needed aircraft without using strategic materials.

(3) Röhm & Haas, A. G. of Darmstadt, Germany (hereinafter sometimes referred to as Darmstadt), organized under the laws of Germany, is a company engaged in manufacture of various chemicals and their products. This firm which is the outgrowth of the partnership between Dr. Röhm and Mr. Haas acquired many of the basic patents in the acrylic plastic field under which Röhm & Haas of Philadelphia was later licensed. Little information is available as to who now controls and prescribes the policy of this firm.

(4) I. G. Farbenindustrie, A. G. of Frankfurt a Main, Germany (hereinafter referred to as I. G.), was organized under the laws of Germany in 1925 as a result of a merger of the six largest chemical and dye producers of Germany. This company virtually controls the entire chemical industry in Germany. I. G. owns and controls many basic patents under which both R. & H. and du Pont have been licensed relating to the acrylic plastic field.

(5) Imperial Chemical Industries, Ltd. of London, England (hereinafter referred to as I. C. I.), a corporation organized in 1927 under the British laws, is one of the largest industrial companies in Great Britain and is the chief factor in the British chemical industry. I. C. I. owns and controls certain basic patents relating to the acrylic plastic field under which du Pont and Röhm & Haas Co., Philadelphia, are licensed.

(6) E. I. du Pont de Nemours & Co., Inc. (hereinafter referred to as du Pont) probably the largest United States corporation engaged in production of chemicals, is comprised of departments and subsidiaries, each of which retains its own identity, but is controlled by the parent company. For the purposes of subject matter involved here, especial attention has been given to activities of the ammonia and plastics departments. The ammonia depart-

Digitized by Google

ment produces the basic plastic materials which are then converted by the plastics department into manufactured articles.

SECTION II. METHACRYLATES

A. Description of methyl methacrylate cast sheeting and its orientation in the acrylic field

Methyl methacrylate is indispensable to our war program since every military airplane (with the exception of some trainer airplanes) built in the United States is equipped with cast sheets of methyl methacrylate, a glass substitute, marketed under the trade names of Plexiglas if manufactured by Röhm & Haas Co. of Philadelphia, Pa., and Lucite if made by E. I. du Pont de Nemours of Wilmington, Del. These two companies are the only manufacturers of this material in the United States. According to the 1940 annual report of Rohm & Haas Co., this corporation handles 85 percent of the aircraft trade. Plexiglas and Lucite are employed exclusively on military airplanes for cockpit enclosures, transparent bomber noses, gun turrets, landing light covers, and windshields.

Cast sheeting of methyl methacrylate has supplanted the use of glass in this field because of its superior qualities. It is less than half as heavy as glass, it is shatterproof, and possesses a permanent, colorless transparency which is superior to optical glass. Lucite and Plexiglas are thermoplastic and can be easily formed into domes and "blisters" for bombers.

There are other synthetic resins which have been used as glass substitutes in the airplane field but none of them possess the particularly advantageous properties of methyl methacrylate sheets. Sheets of cellulose acetate are used in some trainer planes and nitrocellulose sheets have been installed on some of the cheap, privately owned airplanes, but both cellulose acetate and nitrocellulose sheets discolor, warp, and craze upon exposure to sun and weather, thereby rendering their use for military purposes inadvisable. The use of laminated glass, comprised of a plurality of glass sheets bound together by a resinous material, has proved disadvantageous for military airplanes because of the extreme weight of such material. However, it is used on some commercial airplanes.

For military airplane purposes, then, there is no suitable substitute for Plexiglas and Lucite.

In addition to this vital and indispensable role played by methyl methacrylate cast sheets, this material because of its peculiar properties has had a wide range of uses in the commercial, scientific, and industrial fields. Despite its similarity to glass in appearance, methyl methacrylate sheeting can be sawed or carved like wood, can be machined, drilled, and threaded like any soft metal. Designs, figures, and letters can be reproduced on this synthetic resin by stamping, painting, or engraving. As a result, the material is utilized in medical instruments, contact optical lenses, eyeshields, safety goggles, machine-inspection windows, tableware, furniture, household decorations, marine sprayshields, display fixtures, edge-lighted signs, and jewelry. These are but some of the uses.

The form of methyl methacrylate in cast sheets is the most important from a national defense standpoint because of its aircraft role, but this synthetic resin is also manufactured in the form of rods, tubes, commercial molding powders, and denture base materials. These are the polymerized, i. e., solid, forms of methyl methacrylate used commercially.

The chemical in its monomer or liquid form is also employed to impregnate wood, cloth, paper, electrical coils, and then polymerized to a solid to act as a resinous coating.

For an understanding of the intercompany agreements which are discussed later, the orientation of methyl methacrylate to other allied synthetic resins is necessary. Methyl methacrylate is a derivative of methacrylate, which in turn is strikingly similar to the molecular structure of the acrylates. Carbon, hydrogen, and oxygen are the elements which compose all these resins; differences are achieved by the grouping of the elements. Thus, chemically, methyl methacrylate is closely allied to the acrylates, but the methacrylates, of which methyl methacrylate is a type, possess certain physical properties different from the acrylates. The acrylates are soft, sticky, semiliquids, whereas the methacrylates are harder, tougher, and less elastic than the acrylates. Colorless transparency, stability against aging, thermoplasticity, and resistance to most chemicals, are characteristic of both acrylates and methacrylates as a group. This entire grouping

Digitized by Google

of acrylates and methacrylates is often loosely referred to as the acrylic field. However, the distinction between the acrylates and methacrylates is manifest in the various intercompany agreements.

The acrylates are used in the forms of aqueous emulsions and solutions in organic solvents as flexible, permanent finishes for textiles and leather. Adhesives are also made from this synthetic resin.

The first extensive commercial production of the acrylates began in Germany in 1927 when Röhm & Haas, of Darmstadt, Germany, introduced an acrylic resin in a viscous solution, which was used as the laminating layer in shatterproof glass. This resin was marketed under the trade name of Plexigum and the laminated glass made with Plexigum as the binder was marketed under the name of Plexite. Plexigum is today manufactured by Röhm & Haas, of Philadelphia, Pa., but the volume of sales is small as compared to the volume of Plexiglas sales. In 1940 Röhm & Haas Co., Inc., sold only $197,000 worth of Plexigum as compared to sales of $1,782,000 worth of Plexiglas. The decline in the sales of Plexigum is largely attributable to the superseding of Plexigum by vinyl acetal, a cheaper and more serviceable synthetic resin. However, when the first intercompany agreements were executed, primary consideration was given to the use of acrylates and methacrylates in the making of laminated glass.

B. Cartel Agreements

Röhm & Haas, Darmstadt-Röhm & Haas, Philadelphia, agreement of 1927.—The spirit of close though informal cooperation between the German and American company, was translated into a written agreement signed in Philadelphia, on October 14, 1927, and in Darmstadt on November 14, 1927.[1]

It provided for a division of sales territories whereby Röhm & Haas, A. G., received as its territory—Europe, Africa, and Asia—without Japan, and Röhm & Haas Co., Inc., received North and South America, Central America, Australia, New Zealand, and Japan. The agreement provided, also, that in the case of products manufactured or sold at the date of this agreement, neither party would sell directly or indirectly within the territory of the other without the consent of the other party.

In the case of new products thereafter developed, the developing party was to acquaint the other with a view if possible to effecting an agreement whereby the other company would acquire the exclusive sales right within its territory. If such an agreement could not be effected, then the developing party was free to make an independent sales arrangement within the territory of the other, but was to refrain from using the firm name.

The agreement was to remain in effect up to April 30, 1937, and for a period of 5 years thereafter unless canceled prior to April 30, 1936. It was signed by Otto Haas for Röhm & Haas Co., Inc., and Otto Röhm of Röhm & Haas, A. G.

This agreement was drawn up primarily to prevent competition between Röhm & Haas, Co., Inc., and Röhm & Haas, A. G., on products used in the leather-tanning trade, but it is important in the acrylic field because it made provision for negotiations pertaining to later development products.

During the early years of the 1930's Röhm & Haas, A. G., engaged in extensive research on the methacrylates and finally developed the new product called Plexiglas.

Röhm & Haas, Darmstadt-I. G. Farben agreement.—I. G. Farben had also been actively engaged in research in the acrylic field and had received a number of German patents covering the acrylates. The correspondence of this period indicates that I. G. had achieved a dominating position in Germany in the field of the acrylates, while Darmstadt dominated the methacrylic field by means of its German patent application 76098. Sometime in 1934 Darmstadt and I. G. reached an agreement which was expressly to avoid competition. Darmstedt retained control over the methacrylates and especially over cast sheeting of methyl metal crylate, while I. G. controlled the acrylates.

I. G. Farben-Röhm & Haas, Philadelphia, agreement of 1934.—On October 30, 1934, a cross-licensing patent pool was established between I. G. Farben and Röhm & Haas, Philadelphia, on their American and Canadian patents covering the preparation and application of acrylic acid and methacrylic acid.[2] The purpose of the agreement was "to avoid * * * any patent controversies between themselves as to the territory and subject matter covered by this contract and to regulate the conditions of manufacture and sales."

[1] Exhibit 1.
[2] Exhibit 2.

Digitized by Google

The contract extended to the United States and Canada.

I. G. agreed not to use or put on the market acrylic-acid products for use in the preparation of nonsplintering glass. The right to market and use methacrylic acid products as glass substitutes (i. e., cast sheets of methyl methacrylate) and the use of acrylic and methacrylic acid for adhesives was reserved to Philadelphia.

Philadelphia in turn agreed not to use the contract products for the preparation of (1) Photographic articles, (2) celluloid-like masses and products made therefrom, (3) dyestuffs, (4) artificial rubber, (5) pharmaceutical articles, (6) abrasives.

The agreement provided for an exchange of licenses under existing patent rights, and also for an exchange of information on preparation of contract products. An agreement on future patent rights was to be made in each individual case. In case of possible future connections through other contracts, an explanation was to be given on an agreement reached by letter.

Neither party was to grant sublicenses except with the consent of the other. However, I. G. reserved the right to grant sublicenses to "friendly firms" (General Aniline Works and Standard-I. G.) under the license granted to I. G. by Philadelphia. I. G. was also free to grant sublicenses for manufacture of contract products used in preparation of artificial rubber.

It was agreed that until further notice Philadelphia alone would manufacture the contract products in the United States. Philadelphia further agreed to deliver contract products to I. G. and "friendly firms" at cost plus 10 percent.

I. G. agreed not to ship contract products into the United States or Canada, and Philadelphia agreed not to ship them outside of Canada or the United States and was to prevent its customers from doing so.

Within the scope of the subject matter and territory of the contract, both parties agreed not to attack the status of foreign and domestic patents of the other party, but on request were to assist one another. Any pending patent controversies were to be dropped.

The contract was to extend until June 13, 1950, and was signed for Röhm & Haas, Philadelphia, by Otto Haas at Ludwigshafen au Rhein.

As a result of this agreement and the Darmstadt-I. G. contract, competition in the United States market in the cast-sheet field by the enormous I. G. inerests never materialized.

Insofar as other uses of the acrylates and methacrylates were concerned, the Philadelphia company accepted the restrictions placed upon it by this agreement. On December 16, 1935, S. C. Kelton prepared an interoffice memorandum for Mr. Haas in which he said:[3]

"We already have an agreement with I. G. in which we divide the acrylic and methacrylic field between ourselves and I. G. Under the agreement with I. G. certain uses of the products are reserved to I. G. and certain ones to us. We, ourselves, no longer have the right to use the products in the field for certain purposes, * * *."

Another restrictive feature of this agreement was that which specified that neither party was to grant sublicenses to third parties without obtaining the consent of the other. Mr. Haas in discussing this feature with I. G. stated:[4]

"* * * But one thing was clearly provided, namely, that third parties should be prevented from entering into the fields and therefore the exceptions were stated in the contract. Only the "friendly firms" and acquirers of licenses as to synthetic rubber should be included in the contract * * *."

During 1936 du Pont entered into negotiations with I. G. for a license under I. G. Patent 1,933,252 relating to mixtures of vinyl chloride and methacrylates made by the emulsion polymerization process. I. G. could not license du Pont under this patent without receiving the consent of Philadelphia. Since these mixtures could be employed as widely as the pure methacrylates, Philadelphia refused to assent to such a license unless du Pont was restricted from using it in cast sheeting. Negotiations pertaining to this patent and other related patents of I. G. continued until 1939 when it appears the three companies finally agreed upon a license to du Pont restricted in the manner the Philadelphia company had demanded.

During the years following the execution of the Philadelphia-I. G. 1934 agreement the restriction placed upon the Philadelphia company that it was not to use the acrylate and methacrylate resins in any of the six fields reserved to I. G. proved to be a definite hamper to the normal development of commercial

[3] Exhibit 3.
[4] Exhibit 4.

Digitized by Google

outlets for these resins. Writing to I. G. on December 30, 1938, Mr. Bergin complained about the effect of these restrictions, saying: [5]

"To illustrate how these restrictions hamper us we should like to review for you what happened in the photographic field. Back in April 1936 we were approached by the Eastman Kodak Co. for information concerning the acrylic resins. We immediately wrote to Dr. Duisberg to inquire as to what we should do. Considerable correspondence followed and the matter was discussed when Mr. Haas was in Germany in the summer of 1936 and again when Dr. Kleber visited us later in the year. It was not until December 1936 that Dr. Duisberg told us orally that I. G. would waive all restrictions in the photographic field. From April until December we were in the position of not knowing whether we could supply Eastman and as a result, could not give them our wholehearted cooperation. The uncertainty of our position eventually discouraged Eastman and by the time we obtained your oral consent, they had lost all interest and turned to another product. Had we been able to cooperate, we are confident that some profitable business would have materialized."

Bergin also pointed out that I. G. was not exploiting many of the fields reserved to it and since Philadelphia was prevented from working them by the agreement, no one was benefiting thereby.

Negotiations aimed at a modification of this agreement continued through 1938 and 1939 finally reaching a conclusion in 1940 when a written supplementary agreement was executed.[6] It provided for a modification of the 1934 agreement as to three fields.

Photographic articles.—I. G. granted the Philadelphia company the right to deliver acrylic and methacrylic products for use in the photographic field to any interested parties in the United States and Canada with the reservation, however, that Röhm & Haas, Philadelphia, and its customers were not entitled to use existing or future patent rights of I. G. or of General Aniline and Film Corporation relating to the use of the contract products for the preparation of photographic films or articles. Röhm & Haas agreed to stop deliveries of the contract products whenever informed by I. G. that a certain customer was infringing an I. G. patent in this field.

Abrasives.—I. G. also granted Philadelphia the right to use the contract products in the field of the abrasives upon condition that Röhm & Haas observe the same restrictions as were placed on their use in the photographic field.

Celluloid-like masses.—I. G. modified the 1934 agreement so that Philadelphia was free to market in the United States and Canada the contract products for the preparation of celluloid-like masses or products made therefrom. Three patents of I. G. not in existence at the time the original contract was executed were included in this license to Röhm & Haas, Philadelhpia. There was also to be an exchange of experience in the field of celluloid-like masses.

This supplementary agreement was to expire at the same time as the principal contract.

In June 1940 there was signed another license agreement [7] by these two corporations concerning an I. G. patent covering interpolymerization products of vinyl chloride and esters of maleic acid, a newly developed synthetic resin. This agreement differed from the others inasmuch as I. G. retained the right to market the products in the United States and Canada. The Philadelphia company agreed not to sell the contract products for the manufacture of dyestuffs, pharmaceuticals, or medicinals, including dentures. The use of the contract products for the manufacturing of photographic films and abrasives was permitted to Philadelphia but Röhm & Haas and its customers were not entitled to use existing or future patent rights of I. G. and General Aniline & Film relating to the use of the contract products for the manufacture of photographic films and articles, or waterproof abrasives.

The Philadelphia company agreed to sell the contract products to the I. G. and its "friendly firms" in the United States and Canada at cost plus 10 percent so long as I. G. did not undertake to manufacture them in the United States and Canada.

Philadelphia also assented to a prohibition on exports out of the United States and Canada and agreed not to attack the validity of the I. G. patent. The agreement was to run until 1957, during which time Philadelphia agreed to pay a royalty of 5 percent of the net sales price of the contract products sold.

---

[5] Exhibit 5.
[6] Exhibit 6.
[7] Exhibit 7.

During the period in which these negotiations were conducted Chemnyco., Inc., 521 Fifth Avenue, New York City, the law firm of Hutz & Joslin, 521 Fifth Avenue, New York City, and Dr. Walter H. Duisberg, 521 Fifth Avenue, New York City, at various times acted as representatives and agents for I. G. Farben.

It is apparent that many of the provisions of the Röhm & Haas, Philadelphia, and I. G. agreements were not concerned primarily with cast sheets. However, these agreements and negotiations in the general acrylic field are important since they demonstrate the rigid and harmful patent control exerted by the German interests over the development in America of new and commercially unexplored chemical fields.

Röhm & Haas, Darmstadt-Röhm & Haas, Philadelphia agreement, 1934.—Soon after the execution of the I. G.-Philadelphia agreement in 1934 the informal understanding between Philadelphia and Darmstadt on the acrylates and methacrylates was reduced to writing. In a contract [8] signed by Otto Haas and S. C. Kelton on November 24, 1934, on behalf of Philadelphia, and by Dr. Roehm for Darmstadt on January 30, 1935, the subject matter was delineated as those processes and products developed by Philadelphia or Darmstadt for the manufacture and use of acrylic and methacrylic acids and their derivatives.

Darmstadt assigned to Philadelphia the exclusive rights in the United States and Canada and their respective territories and possessions to all United States and Canadian patents and applications pertaining to this field which were owned by Darmstadt. Philadelphia, in turn, assigned to Darmstadt exclusive rights outside of United States and Canada to all foreign patents relating to this field subject to rights granted to I. G. in the contract of October 30, 1934.

Darmstadt agreed not to ship any contract products into the United States or Canada and Philadelphia reciprocated by promising not to ship outside of the United States or Canada and also agreed to endeavor to prevent customers of Philadelphia from so doing.

It was agreed that inventions or improvements by Darmstadt in the field of the contract were to belong to Philadelphia for exclusive use in the contract territory, and Darmstadt was to have exclusive rights outside of the contract territory in any inventions or improvements made by Philadelphia in the field of the contract subject to whatever rights I. G. might have.

Darmstadt also agreed to assign to Philadelphia any Canadian or United States trade-marks or trade names which Darmstadt possessed or might possess relating to contract products.

The decision of all questions relating to United States and Canadian patents or applications was to rest entirely within the discretion of Philadelphia. Outside of Canada and the United States Darmstadt was to decide on all patent questions subject to rights granted I. G.

Philadelphia was to pay in installments $60,000 for the rights conferred on it. Subsequently Philadelphia further agreed to pay a 3-percent royalty on Plexiglas until December 31, 1953.

Philadelphia began the commercial production of Plexiglas in March 1936 and, pursuant to this agreement, Philadelphia refused all export orders on Plexiglas, referring all inquiries to Darmstadt. On March 31, 1936, D. S. Frederick, of the Philadelphia company, wrote to Darmstadt: [9]

"We have decided to leave to you the Plexiglas sales which you may develop in the Philippine Islands. As you are handling the other foreign trade on the Plexiglas, it will be much better if you also deal with the Philippine customers."

July 21, 1936, Philadelphia wrote to Darmstadt, saying: [10]

"We recently received a call from the Budd Wheel Co. asking that we send a representative to their office to interview two visitors from abroad, one from Italy and one from France, who were interested in Plexiglas * * * the Budd Wheel Co. was informed that all European Plexiglas developments were handled by Röhm & Haas, Darmstadt."

Philadelphia turned down more export orders in 1938 when it refused to sell any acrylic resins to Australia because of the restrictions imposed by the agreement with Darmstadt.[11]

In an interoffice memorandum of August 3, 1938,[12] the Philadelphia company noted that Darmstadt had given revocable permission to Philadelphia to sell replacement parts of Plexiglas for airplanes manufactured in the United States but

[8] Exhibit 8.
[9] Exhibit 9.
[10] Exhibit 10.
[11] Exhibit 11.
[12] Exhibit 12.

Digitized by Google

later exported. On these replacements Philadelphia was to pay a royalty of 10 percent instead of the usual 3-percent royalty on Plexiglas sales. Furthermore, in the case of shipments to France or Belgium a special permit was to be secured from the French licensee of Darmstadt.

On July 18, 1939, Philadelphia, having received permission from Darmstadt to quote prices on Plexiglas to Russia, reported to the German firm that if any orders were received Darmstadt would be paid a royalty of 10 percent.

With the outbreak of the European war in September 1939, Darmstadt found itself cut off from the South American and Asiatic markets by the British blockade. Accordingly, on September 14, 1939, Darmstadt sent the following letter to Philadelphia:[13]

"Present-day conditions in Europe make it impossible for us for the time being to deliver to overseas markets which have been reserved for us. We would therefore like to make the following offer to you:

"You take over sales to the following countries—and this agreement can be revoked at any time: The Middle and South American States, Japan, China, and Siam.

"For the handing over of these markets you will pay us, apart from the regular license fee, 15 percent on all sales of Plexiglas to those countries. * * *

"At the time when we will be able again to sell to the aforementioned countries you will let us have copies of all bills, price arrangements, etc., which are necessary for us in order to get back into the business again. As far as possible, abide by the prices which are known to you.

"Enclosed please find details concerning sales to the aforementioned countries. As far as possible, continue the agreements with our representatives in those countries.

"If you want to accept this offer, please cable 'M 202 agree' and we shall notify our representatives of this agreement."

There followed a detailed account of Darmstadt's export activities in the aforementioned countries stating the distributor used, the prices charged, and the extent of business operations carried on in each country.

Philadelphia did not immediately assent to this proposal because it did not feel it could sell at Darmstadt's prices, nor could it allow a 15-percent royalty on the sales.

It was finally agreed that Darmstadt would receive a royalty figured on a sliding scale depending on the thickness of the Plexiglas, the royalty to range from 3 percent up to 25 percent of the sales price. On December 26, 1939, Philadelphia wrote to Darmstadt:[14]

"* * * As we agree on the prices to be charged to your distributors, we shall make this arrangement effective immediately and we are writing to your distributors in the countries listed above. As far as possible, we shall sell through your distributors, but in some cases we may find it advisable to sell through other firms. * * * We shall keep copies of all correspondence and invoices on sales in the above-mentioned countries and shall be glad to submit these copies to you when you are ready to take over this business."

The control exerted by Darmstadt over the Philadelphia company, insofar as the world markets were concerned, is shown by the following exchange of cables in April 1940:[15]

Philadelphia cabled Darmstadt on April 18, "Have inquiries for substantial Plexiglas for Dutch East Indies. May we quote?"

Darmstadt replied April 19, "Give our consent to delivery of Plexiglas to Dutch Indies today * * *."

The next day Darmstadt wrote to Philadelphia informing it that Darmstadt had some orders from a firm in the Dutch East Indies which Darmstadt had been unable to fill because of the war, and therefore the German company requested Philadelphia to contact this Dutch firm and inform it that Philadelphia would perform the contract in lieu of Darmstadt.

Later correspondence to Darmstadt indicates that Philadelphia was not particularly anxious to enter the export market at this time because its domestic customers were taking its entire capacity and orders were booked considerably in advance of delivery dates. On April 22, 1941, Philadelphia in a letter to Mr. Nelson Rockefeller,[16] Coordinator, Council of National Defense, stated that it would not be worth while for the Philadelphia company to go to any great expense

[13] Exhibit 13.
[14] Exhibit 14.
[15] Exhibit 15.
[16] Exhibit 16.

Digitized by Google

to develop the South American trade since there was a good chance that its right to sell in South America might be cut off when the war ended, and therefore the company was perfectly willing to stop all further sales of Plexiglas and Crystalite to South America, if Mr. Nelson's department thought it advisable. The ramifications of the Philadelphia company's South American trade in other products not covered by the Darmstadt agreement are developed later.

However, it is well to note here the effect of the restrictions of the Darmstadt-Philadelphia, and I. G.-Philadelphia agreements upon the marketing of another of the acrylic products, namely, Plexigum, which is used as the intermediate layer in laminated safety glass. In these agreements Philadelphia agreed not to export Plexigum and agreed to endeavor to prevent its customers from so doing.

Inasmuch as the Philadelphia company did not manufacture sheet glass, it entered into an agreement May 23, 1935, with the American Window Glass Co.[17] whereby the latter agreed to use Plexigum exclusively in the manufacture of laminated glass. The agreement also provided that Philadelphia was to pay American Window Glass Co. one-third of the net profits from sales of Plexigum. The Philadelphia company also agreed not to sell except to certain-named customers without first consulting American Window Glass Co. as to the advisability of selling to others. Those to whom Philadelphia was free to sell were Libby Owens Ford Glass Co., Pittsburgh Plate Glass Co., American Window Glass Co., Bausch & Lomb Optical Co., and any automobile manufacturing company. It was further agreed that Philadelphia would sell Plexigum to those only who would exploit its use in the manufacture and sale of laminated glass "in a manner not inimical to the best interests of the several licensees."

Philadelphia agreed to take all reasonable efforts to prevent the importation into the United States and Canada of Plexigum and particularly by or on behalf of Darmstadt or its licensees.

American Window Glass agreed to endeavor to induce laminated-glass manufacturers to buy Plexigum from Philadelphia.

All improvements and inventions relating to the manufacture of Plexigum or method of manufacturing laminated glass were to become part of the subject matter of this agreement.

American Window Glass Co. agreed to assign to Darmstadt all of its rights outside of the United States and Canada insofar as they related to the process of making laminated glass with Plexigum.

American Window Glass Co. also agreed not to export, without the consent of Darmstadt, laminated glass made with Plexigum except when such glass was part of a finished product equipped therewith, such as automobiles or airplanes.

The contract was to last until 1951 and was signed by William L. Monro, president of American Window Glass Co., and Otto Haas, president of the Philadelphia company.

During 1935 the American Window Glass Co. sought to have the restrictions on exporting to South America lifted but this was never accomplished because both Darmstadt and I. G. Farben had to agree upon this modification of their agreements with Philadelphia through whom the American Window Glass Co. claimed. Darmstadt consented but the modification was blocked by I. G., and American Window Glass discontinued its efforts.

In 1936 the Pittsburgh Plate Glass Co. introduced into the laminated glass market a vinyl acetal resin which undersold Plexigum and proved technically superior in some respects. During the next few years Plexigum was largely displaced by this vinyl acetal resin so that at the present time Plexigum no longer retains the commercial importance it once possessed.

Imperial Chemicals Industries—du Pont agreements.—On July 1, 1929, Imperial Chemicals Industries, Ltd., of Great Britain and E. I. du Pont de Nemours executed a cross-licensing agreement[18] whereby Imperial Chemicals Industries agreed, upon request, to grant du Pont an exclusive license to make, use, and sell within North and Central America, exclusive of Canada, Newfoundland, and British possessions, but otherwise inclusive of the West Indies, enumerated products made by either present or future patents and secret inventions controlled by I. C. I., and du Pont granted Imperial Chemicals Industries a reciprocal right as to the British Empire, inclusive of Egypt, but exclusive of Canada and Newfoundland. Each agreed to grant the other a nonexclusive license within all other countries except Canada and Newfoundland, not in the specified exclusive territories.

The agreement contained an extensive list of products covering many chemical fields. Among these products were "acids, both organic and inorganic, for both

[17] Exhibit 17.
[18] Exhibit 18.

Digitized by Google

the heavy chemical industry and special industries." This provision could cover acrylic acids and later it was so interpreted by du Pont and I. C. I.

The agreement was signed by Lammont du Pont, president, and M. D. Fisher, assistant secretary, for the du Pont Co., and by H. McGowan, president and director, and R. A. Lynex, assistant secretary, for the Imperial Chemicals Industries. The term of the agreement was 10 years.

A supplemental agreement was executed on December 27, 1934,[19] between these companies which provided (1) that each party had the right to exclude from the operation of the agreement inventions and secret information relating to products for military purposes; and (2) that the licensor had the right in all cases and in all territories to sell products covered by any licensed invention.

On June 30, 1939, I. C. I. and du Pont renewed their agreement of 1929 as modified by the 1934 agreement.[20] The new agreement incorporated a few minor changes and was to remain in force until 1948.

The correspondence from the du Pont files indicates that du Pont remained out of the territory reserved exclusively to I. C. I. As soon as du Pont began commercial production of the methyl methacrylate resins in early 1939 it adopted the procedure of refusing all orders emanating from the British Empire and referring them to I. C. I.[21] In special instances where I. C. I. was not yet in commercial production on certain types of methacrylate resins, I. C. I. instructed du Pont to fill British orders until such time as I. C. I. was in a position to supply them itself. Otherwise the division of markets was followed strictly, thus indicating that the right of the licensor to sell in the licensee's exclusive territory was not exercised but merely inserted to mask illegality.

Contemporaneously to the research efforts of Philadelphia, Darmstadt and I. G., Imperial Chemicals Industries had emarked upon extensive research pertaining to the acrylic field. United States Patent 1,980,483 issued on November 13, 1934, to Rowland Hill, who assigned to Imperial Chemicals Industries. This patented as a new composition of matter the polymer of methyl methacrylate. This patent dominated the manufacture of cast sheets of methyl methacrylate, e. g., Plexiglas, since it would be an infringement of this patent for any unlicensed person to use polymerized methyl methacrylate.

Du Pont—Röhm & Haas, Philadelphia, agreement of 1936.—Pursuant to the Imperial Chemicals Industries—du Pont agreement of 1929, du Pont received the exclusive American rights under the Hill patent from Imperial Chemicals Industries. Du Pont also filed an application for a patent on the monomer of methyl methacrylate. Philadelphia filed an application for Hollander and Neher (both research chemists of the Philadelphia company) which copied the claims of the Hill patent and the du Pont application on the monomer. The Patent Office declared an interference, 70829, between these claims. The evidence indicates that Philadelphia's scientists had discovered the polymer of methyl methacrylate in June 1931, whereas Hill's priority date was November 17, 1931, but proof of the date of discovery claimed by Philadelphia was very weak. Since du Pont already possessed a patent on the polymer of methyl methacrylate, Philadelphia could not attack the validity of this patent in an interference proceeding but could seek a patent on this material for itself. This was Philadelphia's objective in this interference. Both du Pont and Philadelphia had filed applications covering the monomer of methyl methacrylate, but both apparently realized the monomer was unpatentable. No patent was subsequently issued on the monomer claims of either party.

Concerning the strength of the Hill patent as it pertained to the polymer, J. F. Bergin, the patent attorney for the Philadlphia company, asserted in various interoffice memoranda that the Hill patent was of very questionable validity and that should Philadelphia lose the interference, it could afford to disregard this patent. Later when the du Pont–Philadelphia agreement was about to be signed, Mr. Bergin changed his views and declared the Hill patent was valid.

The weakness of the Hill patent was also recognized by du Pont for in an interoffice memorandum writtten May 29, 1935, by W. R. Gawthrop to F. A. Wardenburg the writer admits the patent is of questionable validity. Furthermore, on June 19, 1935, E. G. Robinson, general manager of the organic chemicals department, wrote to F. A. Wardenburg.[22]

"If the Hill patent were strong and would give us a dominating position in the field of methyl methacrylate, we might hesitate to give up that position

* * * if, however, there is a considerable doubt as to its valadity, a settlement may be the best method of safeguarding our position. * * *"

October 31, 1935, J. M. Castle, Jr., of du Pont's patent division, mentioned in a letter to A. E. Pitcher, president of du Pont Viscoloid Co.,[23] that—

"* * * the danger that the Hill patent is invalid due to anticipation seems appreciably greater than the danger of losing the patent to Röhm & Haas in this interference."

A number of interferences, seven in all, were declared between Philadelphia and du Pont during 1935. The most important of these, except for the interference on the polymer of methyl methacrylate, concerned the use of acrylic and methacrylic acid as the intermediate layer in laminated glass. Philadelphia held the upper hand in this interference. The other interferences concerned combinations of acrylic and methacrylic acid, which apparently had little commercial importance.

Beginning in July 1935 Otto Haas entered into negotiations with du Pont officials, principally F. A. Wardenburg, general manager of the ammonia department, looking toward a settlement of these interferences. Otto Haas reported[24] on July 8, 1935, that "we (Haas and Wardenburg) shall both think the situation over, clearly keeping in mind what arrangements would be possible and suitable after the interferences and patents have been cleared up."

Otto Haas was determined that in case the interferences were settled by a cross-licensing agreement, du Pont should not receive any rights in the laminated glass field or in the acrylic acid field.

October 29, 1935, Otto Haas reporting on a conference with F. A. Wardenburg,[25] stated that in reply to Wardenburg's question as to how the companies could cooperate in the event they reached an understanding on methyl methacrylate, Haas replied:

"* * * we could think of a price agreement on the finished product, or a division of our interests. I told him we have not only our own interests at stake, but also the ones of our German house and the I. G."

It should be noted here that Philadelphia had asked permission from I. G. to settle the interferences between Philadelphia and du Pont. I. G. replying through Chemnyco on September 13, 1935, gave assent to such a settlement but recommended that a restriction on the resale of the products was highly desirable.[26]

Also at this time, I. C. I. was negotiating with Darmstadt for an agreement on methyl methacrylate cast sheeting. This agreement which is described later was signed after the execution of the du Pont-Philadelphia contract.

It is clear from the correspondence in the files of the du Pont and Philadelphia companies that Otto Haas had in mind an agreement which went far beyond settlement of the interferences. J. M. Castle, Jr., of the patent division of du Pont's legal department, in a letter of October 31, 1935, to A. E. Pitcher recounts the proposals made by Mr. Haas in a conference with Mr. Wardenburg. Referring to the methyl methacrylate field, the writer states:[27] "Mr. Haas suggested a possible commercial arrangement whereby each party would have its customers which the other would leave strictly alone."

On December 19, 1935, Mr. Haas forwarded to du Pont a tentaive rough draft of the proposed agreement which provided inter alia:[28]

"* * * it is agreed that R. & H. and du Pont will cooperate in the exploitation of the solid polymer of the methyl ester of methyl methacrylate and that the du Pont Co. will not engage in the manufacture or sale of the polymeric forms of the other esters of acrylic or methacrylic acid * * *"

The illegality of such a proposal was recognized by W. R. Gawthrop of du Pont in a memorandum to F. A. Wardenburg in which the writer argues that du Pont should not concede so much to Philadelphia and then proceeds to say:[29]

"Even if the substance of the foregoing restrictions were acceptable to us, the method proposed for setting them up could not be approved. As proposed by Mr. Haas, the agreement would be a violation of the Clayton Act. So far as we are concerned any such apportionment of rights would have to be accomplished by actual licenses, or omissions of licenses, under patents or applications, and not by an agreement not to engage in some particular line of manufacture."

Although du Pont's position on the wording of the agreement prevailed in the final draft, the actual effect of the agreement was that du Pont remained out of the field of laminated glass using an intermediate of acrylate, and in a broader way stayed entirely out of the acrylates as differentiated from the methacrylates. Mr. Wardenburg in a meeting with Mr. Haas as late as February 7, 1941, indicated that du Pont still resented being kept out of the acrylate field and wished this restriction removed.[30]

On March 5, 1936, the differences between Philadelphia and du Pont were finally ironed out and the agreement was signed by Otto Haas and S. C. Kelton for Philadelphia and W. F. Harrington, vice president, and E. A. Howard, assistant secretary for du Pont.[31] The interferences were to be terminated by concessions of priority in favor of the party entitled to prevail as determined by the respective attorneys after considering the evidence of priority submitted by both sides. Du Pont and Röhm & Haas, Philadelphia, granted each other nonexclusive royalty free licenses under all United States patents and future patents granted on applications in the interferences to manufacture, use and/or sell the products or inventions insofar as they related to the acrylic and methacrylic acid fields. However, du Pont received no license from Philadelphia under any patent claim to laminated glass or to polymers or interpolymers containing acrylic acid. The licenses carried no right to sublicense except that each party had the right to grant its customers purchasing contract products a sublicense to process and sell the products throughout the United States. The agreement was to remain in effect until expiration of the last patent under which a license was granted.

On the same day the contract was signed F. A. Wardenburg wrote to Otto Haas that in order to avoid any misunderstanding he wished to point out that though the preamble stated du Pont had exclusive rights in the United States as to the I. C. I. patents within the field of the agreement, the exclusive licenses to du Pont did not exclude I. C. I.'s right to sell the patented products within the United States. To this Mr. Haas replied on March 7, 1936.[32]

"Whenever in the past we have acquired foreign licenses under an exclusive license arrangement, it was understood that the seller kept out of our market. Therefore * * * I took it for granted that the exclusive rights * * * meant that the I. C. I. would stay out of the United States. * * * The value of the agreement depends a good deal on the I. C. I.'s plans and intentions in the United States. If they wish to sell here moulded articles, it is one thing. If they intend to sell moulded powders and polymers in solution, it is another."

On March 9, 1936, Otto Haas reported that F. A. Wardenburg had assured him by telephone "* * * there is not any chance at all that I. C. I. will attempt to disturb the market, either by importations or otherwise." In another telephone conversation held with Mr. Wardenburg on April 3, 1936, Mr. Haas reported that Mr. Wardenburg stated.[34]

"* * * I. C. I. reserves to itself the right to sell in the United States in emergency cases, but Mr. Wardenburg assured me that although this has been in force for many years, such an emergency has never arisen * * *."

In a letter of April 9, 1936, Mr. Wardenburg again wrote to Mr. Haas:[35]

"I can only reiterate what was stated in my letter of March 5, namely, that in our license from I. C. I. they reserve the right to sell patented articles in the licensed territory."

Mr. Haas replied on April 13 that this letter was not satisfactory because he had "responsibilities to other parties to whom I have to explain the situation and I do not see how I could do this without embarrassment."[36]

Three days later Mr. Wardenburg called on Mr. Haas, the latter making this report:[37]

"(Wardenburg) repeated over and over again that there is not the slightest possibility of the I C. I.'s coming into the American market but du Pont is afraid to write a letter to this effect because in case of an investigation of their firm by politicians, the politicians might make capital of such a statement, i. e., they might attempt to point out that the world was divided up between I. C. I. and du Pont.

"I told Mr. Wardenburg that I had implicit faith in all the assurances which they had made to me, but that for my own protection I had to have a letter from du Pont in which they can assure us, in one way or another, that the I. C. I. will not take this opportunity to come into this market. After a lengthy discussion of the different ways to accomplish this purpose, it was agreed that Mr. Wardenburg will write a letter saying that while it is true that the I. C. I. under their contract have a right to come into the American market, du Pont happens to know that the I. C. I.'s development in the methacrylic ester field has taken a direction which is quite different from the one that is being taken by du Pont and ourselves so that it will be highly improbable that the I. C. I. will attempt to come into the United States market. I told him such a letter would be satisfactory."

As a result of this discussion the following letter was received by Mr. Haas on April 17, 1936, from Mr. Wardenburg:[38]

"My attention has been called to the fact that no reply has been made to your letter of March 7 with reference to the license agreement between our two companies. As pointed out to you in our letter of March 5, I. C. I. retains the right to sell the patented products in this country. However, it happens that one of our principal men was able to visit the I. C. I. plant on a trip to Europe, which he was making in connection with another matter. It was learned that their work in developing the marketing of the materials covered in our license agreement is along quite different lines than those which seem to us to be attractive in this country. We would assume from our observations, therefore, that there is little likelihood of their exercising the right which they retain to sell the products in question in this country."

To this Mr. Haas replied on April 18, 1936, to Mr. Wardenburg, "Your letter of April 17 is quite satisfactory."[39]

This correspondence has been set forth in considerable detail because it indicates clearly, first, that the I. C. I.-du Pont agreements of 1929 and 1934 were essentially cartel arrangements providing for a definite division of world trade, second, the purpose of the du Pont-Philadelphia agreement of March 5, 1936, was more than a mere settlement of patent interferences.

The purpose of the du Pont-Philadelphia agreement is much more baldly explained in the interchange of correspondence at this time between Darmstadt and Philadelphia.

On February 22, 1936, Darmstadt voiced its fear to Philadelphia that du Pont might receive a license on the process of making Plexiglas as a result of the agreement. Darmstadt further asked:[40]

"Who has the advantage of this exchange? The party which at present or in the future has the technically most valuable inventions appears to be at a disadvantage because they will have to share their rights with the other party without compensation. Therefore, the incentive to push the development forward would be influenced, and only the party who could sell the cheapest would have any advantage. We believe that an arrangement of this type would only be justified if at the same time there were made an understanding concerning the market and price. It does not appear that there has been any discussion on these points with du Pont."

Mr. Bergin in a letter of March 6, 1936, pointed out to Darmstadt that the process for making Plexiglas was not revealed to du Pont. He stated that the essential features of the Plexiglas process are:

(1) Polymerizing in a relatively narrow mold.
(2) Uniform application of heat.
(3) Controlling the temperature during polymerization.

None of these features were disclosed in any of the patents and applications covered by the agreement. Bergin further explained to Darmstadt that the agreement did not cover future inventions.

Then on March 10, 1936, Mr. Haas answered the other question raised by Darmstadt's letter of February 22. Writing to Dr. Röhm, Mr. Haas said:[41]

"Before going into the interference situation at all I had told the du Pont executive who had made the overtures to us (Mr. F. A. Wardenburg) that it is necessary to consider what to do after we have exchanged licenses. I told them

[38] Exhibit 38.
[39] Exhibit 39.
[40] Exhibit 40.
[41] Exhibit 41.

Digitized by Google

that they would have to stay out of the laminated glass field and the acrylic-acid field, i. e., that they cannot expect any licenses from us in these two fields and that it is advisable to have an informal understanding how to act in the fields where both firms have the right to proceed. We arranged that in the case of products where we compete, we shall consult with each on prices, etc., in order to avoid destructive price cutting. A matter like this cannot be put into the contract, because it would be against the law. We have to rely on our verbal assurances and our experience with du Pont during the last 15 years has proven that they can be relied upon to live up to an arrangement of this kind.

"Please treat this confidentially."

This illuminating letter explains rather pointedly the purpose and objectives of this cross-licensing agreement. Further credence is lent to this letter by the already discussed reports found in the du Pont and Philadelphia files pertaining to the negotiations preceding the agreement.

The procedure for the disposition of the interferences between du Pont and Philadelphia was followed out in the months subsequent to the execution of the agreement. After conferences of their respective attorneys, Philadelphia conceded priority to du Pont on the methyl methacrylate case, du Pont conceded the laminated-glass case to the Philadelphia company, and the other five less important interferences were handled similarly.

I. C. I.-Darmstadt Agreement of 1936.—It is necessary at this point to interrupt the story of the du Pont and Rohm & Haas, Philadelphia, conspiracy in order to round out the picture of the international cartel on methyl methacrylate cast sheeting. As previously stated, I. C. I. was conducting negotiations with Darmstadt contemporaneously to the du Pont-Philadelphia settlement.

On October 10, 1935, Maj. A. E. Hodgkin, of I. C. I., meeting with Dr. Roehm and other officers of Darmstadt, stated that I. C. I. wished to avoid competition on methacrylic acid products. I. C. I. had not yet engaged in the actual commercial operations for manufacture of cast sheets but was interested in an exchange of patents and possibly the purchase of Darmstadt's process of making sheets. The Philadelphia company's attitude on these negotiations is illustrated by the following excerpt from a cable to Darmstadt on October 14, 1935:[42]

"* * * Suggest you intimate I. C. I. that any agreement which you will make will be conditioned upon satisfactory arrangement in United States field between their licensees and ourselves * * *."

The interrelation of the I. C. I.-Darmstadt and du Pont-Philadelphia parleys is brought out by the interchange of cables between Darmstadt and Philadelphia in late November 1935. Darmstadt cabled:[43]

"* * * I. C. I. wants Empire, Scandinavia, Holland, leaves us remaining Europe and Russia, division to cover entire methacrylate field. I. C. I. offers us £3,000 for Plexiglas process * * * I. C. I. suggests mutual simple license on methacrylate patents. Du Pont can deliver to Europe according to contract with I. C. I. but may not manufacture there * * *. We are inclined to accept I. C. I. suggestion for market division and discussion of patents and to sell Plexiglas process for £5,000. You should prevent du Pont exporting to our territory."

Philadelphia replied:[44]

"We expect coming definite understanding du Pont patent situation within 2 weeks and hope for favorable outcome provided you can hold open I. C. I. negotiations. If you conclude arrangement before, danger is that du Pont will try to bluff us out. With your negotiations pending we can always threaten du Pont with I. C. I. pressure. Utterly inadvisable you selling your process. Preferable you both exchange manufacturing experience after signing agreement. Hold Canada open to us. We are trying to prevail on du Pont not to go to Europe but can do this better if you hold open your I. C. I. negotiations until we are finished * * *."

On March 30, 1936, Mr. Haas wrote to Darmstadt his recommendations on the pending I. C. I.-Darmstadt agreement. Mr. Haas pointed out that Darmstadt and Philadelphia had a unique process for casting sheets that neither I. C. I. nor du Pont could duplicate. Du Pont's and I. C. I.'s process was to cast a block and cut the sheets from the block. However, this did not produce a sheet with as smooth a surface as that achieved by Darmstadt. Rather than have

[42] Exhibit 42.
[43] Exhibit 43.
[44] Exhibit 44.

Digitized by Google

Darmstadt sell their process for a sum, Mr. Haas believed it was better to have a broad agreement, as he expressed it:[45]

"The ideal arrangement would be one that covers not only sheets, but also moulding powders, that you divide the territories * * *, and that the arrangement includes licenses, exchanges of experience, and selling price understanding."

Most of these suggestions were incorporated in the agreement executed August 31, 1936, between I. C. I. and Darmstadt.[46]

The contract products were sheets consisting substantially of polymerized methacrylic acid. It did not include blocks, rods, film, or tubes.

The territory of the agreement included the whole world except Canada and the United States and their possessions in which I C. I. and Darmstadt were bound by prior commitments. The rest of the world was divided as follows:

Exclusive to I. C. I.—United Kingdom, British Empire and mandated territories.

Exclusive to Darmstadt—Europe (inclusive of whole of Union of Soviet Socialist Republics), less Holland, Denmark, Norway, and Sweden.

Common territory—Holland, Denmark, Norway, Sweden, and all other territories not previously mentioned.

Neither party was to manufacture sheets or sell them in the exclusive territory of the other, nor license others to do so, nor sell to third parties for export as such. The parties recognized it was not practical to attempt to control fully the exportation by third parties of fabricated goods made from sheets. They did undertake, however, to restrict exports to each other's exclusive territory of such goods when fabricated by third parties for use as a substitute for safety glass in the aircraft, motor vehicle, and protective-goggle industries. But no restriction was placed upon exports of which the contract products formed a part only or which might be required as spares or replacements for use in manufactures originating in parties' own exclusive or nonexclusive territory.

Darmstadt warranted that Philadelphia would be bound by the provisions relating to I. C. I.'s exclusive territory.

Darmstadt further agreed to demonstrate their process for sheet manufacture to I. C. I. and I. C. I. agreed not to disclose this process to any third party, nor to use this process in, or export the products of this process to United States and Canada.

The parties agreed to grant each other free nonexclusive, and nontransferable licenses to work all patents under their control relating to the cast sheet process.

Darmstadt agreed not to disclose to Philadelphia or any third party information regarding pending I. C. I. applications, and I. C. I. agreed not to disclose to du Pont or any third party information regarding pending Darmstadt applications.

If any third party should enter the market in contract products in the exclusive territory or either party the latter was to be free to act in such exclusive territory as he should deem fit in regard to such competition.

If competition should arise in nonexclusive territory, the parties were to confer to devise means whereby it might be met whether by inclusion of such third party in a modification of this agreement or otherwise.

The parties undertook not to license, instruct, or assist financially, except for their respective exclusive territories, any third party desiring to manufacture the contract products.

In nonexclusive territories the parties were to agree upon prices from time to time at which the contract products were to be sold.

Nothing in the agreement, with the exception that I. C. I. was not to disclose the cast-sheet process to du Pont, was to restrict the existing relationships and obligations of I. C. I. to du Pont which included the obligation to grant nonexclusive licenses under I. C. I. patents to du Pont if the latter so desired in territories which comprised the exclusive territories of Darmstadt.

The agreement was to remain in force for 10 years or for the duration of any of the patents whichever was longer, unless previously terminated by mutual consent.

Two features of this contract as it affected the marketing restrictions on du Pont and Philadelphia should be noted. First, the true meaning of the next to last paragraph relating to du Pont's nonexclusive right to market contract products in Europe is not clear. Du Pont correspondence interprets the provision as it is written, but a letter from Darmstadt to Philadelphia on July 16, 1936, throws an entirely different light on it. Darmstadt wrote:[47]

---

[45] Exhibit 45.
[46] Exhibit 46.
[47] Exhibit 47.

Digitized by Google

"According to information given by I. C. I. section 11 (of I. C. I.-Darmstadt agreement) is merely a matter of form in regard to du Pont. The I. C. I. remains obligated to prevent as far as possible du Pont or any other third party from entering the contractual territory and it regards it as highly improbable that du Pont will enter the European market."

The similarity of this letter to the statements made by Mr. Wardenburg to Mr. Haas concerning the understanding between du Pont and I. C. I. that I. C. I. would keep out of the American market, would indicate that the master agreement between I. C. I.-du Pont masked an illegal division of world territories.

Second, Philadelphia was acquainted with the provisions of this agreement and apparently assented to the provision whereby Darmstadt warranted Philadelphia would not enter I. C. I.'s exclusive territory, for on July 30, 1936, Mr. Haas wrote to Darmstadt:[48]

"We have studied your draft and think it satisfactory in a general way * * *. As to division of territory * * * Japan and possibly South America may become important in time and it may be worth while for you to secure exclusive rights in these territories."

Thus, through a series of bipartite agreements executed at different times there was constructed an international cartel covering products of the acrylic field, the principal thread running through these agreements being the conspiracy pertaining to cast sheets of methyl methcrylate. The investigation developed the fact that though some of the conspirators never had direct dealings with one another, an over-all division of territories was worked out, whereby Philadelphia kept out of the world markets and du Pont remained out of the British Empire except when given permission in special instances, and I. C. I., Darmstadt, and I. G. Farben, remained out of the American market.

The next development to be followed is that of the domestic conspiracy between the Philadelphia company and du Pont.

Marketing arrangements of the Röhm & Haas and du Pont companies.—The Philadelphia company began the commercial production of Plexiglas in March of 1936 but it was not until 1938 and 1939 that its marketing policy became established. Insofar as Plexiglas was concerned this company sold second- and third-grade sheeting directly to small fabricators who manufactured it into numerous commercial objects such as furniture, jewelry, tableware, etc. When the aircraft manufacturers began production of military airplanes in 1939 Röhm & Hass, Philadelphia, sold first-grade Plexiglas to them directly also. But for the aircraft factories producing commercial airplanes, Röhm & Haas entered into a distributor agreement on May 12, 1939,[49] with Air Associates, Roosevelt Field, Garden City, Long Island, N. Y., whereby the latter was given exclusive sales rights on Plexiglas in the United States to specifically enumerated aircraft manufacturers who were not makers of military planes, and not to the United States Government. It was agreed Philadelphia would sell Plexiglas to Air Associates at prices 10 percent below those quoted to the rest of the aircraft industry. It was also understood that Air Associates would not sell any competitive sheet acrylic plastic. Philadelphia informed Air Associates that they could probably not export to South America since this was Darmstadt's territory. However, Philadelphia did attempt to get Darmstadt's permission to have this restriction lifted which was accomplished only after the war began in September 1939. Canada was closed to Air Associates because Röhm & Haas in January 1939 had given Hobbs Glass, Ltd., Ontario, Canada, an exclusive license for this territory. The provisions of the contract with Hobbs were similar to the Air Associates agreement except there was no restriction on sales to military aircraft producers.

A letter of April 2, 1940, from Philadelphia to Hobbs indicates resale price maintenance:[50]

"In reply to your letter of March 28 we are pleased to advise that it will be satisfactory for you to sell Plexiglas in Canada to the marine industry under the same terms as those given in our letters of January 5, 1939, regarding the aircraft industry. We shall supply you with our Plexiglas for resale to the marine trade in Canada, our prices to you to be 10 percent below our standard selling prices, and your selling prices to the trade to be the same as our standard selling prices * * *."

[48] Exhibit 48.
[49] Exhibit 49.
[50] Exhibit 50.

Digitized by Google

On January 2, 1941, Dr. Frederick, making reference to another letter not in our files wrote to Hobbs Glass, Ltd.,[51] "In my letter of January 2, 1941, to Mr. Bernhardt, I discussed the pricing of the various types of Plexiglas in Canada * * *."

In order to facilitate forming the cast sheets into bomber noses, cockpit enclosures, etc., for the aircraft companies on the west coast, Röhm & Haas erected a small forming plant in 1941. Mr. Haas invited du Pont to enter into a joint ownership of the plant but du Pont's attorneys advised against this. Du Pont considered building its own forming plant on the Pacific coast but the executive committee turned the proposal down because they believed there was no prospect of sufficient demand on the west coast after the termination of the war. Instead du Pont gave the Swedlow Aeroplastics Corporation, of Glendale, Calif., the exclusive right to do forming for the aircraft manufacturers of the Pacific coast. Swedlow was allowed a discount of 6 percent from the prices quoted to the airplane trade. Documents in our possession indicate that du Pont retained control over Swedlow's resale prices.

In a report by Mr. Haas of March 26, 1941, he states:[52]

"Mr. A. E. Pitcher called to say they have decided to send one of their good salesmen out to the coast to keep an eye on the situation, * * *. His name is W. J. Ambersly * * *. Through Mr. Ambersly, however, they will keep in close touch with his (Swedlow's) work, and particularly they will want to know the prices he is quoting * * *."

The exclusive arrangement with Swedlow brought a protest from another fabricator on the west coast interested in forming parts for the aircraft trade. This firm, the New Plastic Corporation, of Hollywood, Calif., wired du Pont on February 28, 1941, as follows:[53]

"We understand that you are contemplating giving Swedlow Aeroplastic Corporation your fabricating and jobbing of Lucite in California stocking raw material and selling them at 6 percent under airplane prices. We have 17 men in the shop working 80 percent on airplane fabrication. We can qualify as to any airplane factory requirements regarding fabrication ability. We cannot compete with preferred fabricators such as Swedlow on the terms now allowed us. It is imperative that we be allowed the same consideration if we are to remain in the business and purchase from you. * * *"

Du Pont replied in the following vein:[54]

"Answering your telegram February 28, we have arranged to have Swedlow Aeroplastics Corporation fabricate our Lucite methyl methacrylate plastic sheeting for the airplane trade on the Pacific coast. This precludes our selling you and others for this field. We are in position, however, to sell you and others Lucite for other uses at our published market prices which is the basis of price to Swedlow on purchases for other than the airplane trade."

Other than arrangements made with Swedlow, du Pont has stated to the investigators that it has no distributors of Lucite for the aircraft trade in the United States, since it sells directly to the individual airplane manufacturers.

However, in Canada du Pont has agreed to allow Canadian Industries, Ltd., to handle all sales of Lucite. Canadian Industries, Ltd., purchases at 15 percent off list price and du Pont claims that C. I. L. established its own resale prices. C. I. L. is jointly owned by du Pont and I. C. I.

1939 agreement between du Pont and Philadelphia.—Until early 1939 du Pont employed a method of making sheets by casting a solid block of methyl methacrylate and then cutting it into thin sheets. This process was not technically comparable to the cast-sheet method employed by Philadelphia since the slicing method utilized by du Pont impaired the visual qualities of the sheets. In 1939 one of du Pont's technical experts visited the I. C. I. plant in England which made cast sheets according to the process disclosed to I. C. I. by Darmstadt in fulfillment of their 1936 agreement. Inadvertently I. C. I. disclosed this process to the du Pont representative and though du Pont subsequently assured I. C. I. it would not utilize this disclosure, soon thereafter it appears that du Pont employed the invention. In April 1939 Philadelphia received a United States patent on that particular phase of the process which had prior to 1939 been unknown to du Pont. Soon thereafter Mr. A. E. Pitcher approached Röhm & Haas, Philadelphia, and

[51] Exhibit 51.
[52] Exhibit 52.
[53] Exhibit 53.
[54] Exhibit 54.

Digitized by Google

stated that du Pont had been using the invention covered by Philadelphia's patent and desired a license under it. Mr. Haas was willing to grant du Pont a license under this patent if Philadelphia's commanding position in this field could be preserved. Therefore he offered a license with a clause limiting the production of du Pont. It was also suggested that the two companies cross-license each other under other less-important patents relating to the cast-sheet process. Du Pont assented to these suggestions and on November 17, 1939, the agreement was signed.[55]

In addition to the cross-licenses on the five process patents involved the agreement specifically limited du Pont's production to a monthly average of 26,400 square feet of salable cast sheets per month. The agreement recited that Röhm & Haas, Philadelphia, was not willing to license du Pont to make more than one-half the quantity of cast sheets Röhm & Haas was then manufacturing. It was stated, however, that if Philadelphia should substantially increase its production, then du Pont should be permitted to increase its production to one-half of Philadelphia's new output. Provision was also made that if the United States Government in the case of an emergency should request a substantial increase in the number of cast sheets that could be produced by the parties, or should I. C. I. request du Pont to supply them with substantial amounts of cast sheets, then the parties were to reconsider the limitation on du Pont. The agreement was to run until the expiration of the last patent under which a license was granted.

On October 9, 1940, du Pont acknowledged information received from Philadelphia and noted that it was now entitled to enlarge its facilities so that it could manufacture a monthly average of 35,000 square feet.

The danger inherent in such a restrictive license materialized within a year. By the end of 1940 du Pont's capacity was insufficient to meet the demands of the defense program so that it was forced to open negotiations for the lifting of the restraint.

In January 1941, with a capacity of 35,000 square feet of salable cast sheets per month, du Pont was so far behind its orders that it was unable to quote deliveries before the 1st of October 1941.[56]

Mr. Pitcher visited Mr. Haas and told him that Philadelphia could either lift the restraint or du Pont would inform the Government of the license restriction. Mr. Haas was willing to lift the restriction for the duration of the emergency if a suitable compensation could be agreed upon.

Mr. Haas suggested two alternative solutions to the problem. First, du Pont should agree at the end of the emergency to curtail its production to one-half of the Philadelphia company's production; or second, Röhm & Haas, Philadelphia, would agree to permanently lift the production restriction in return for licenses under patents controlled by du Pont covering an improved method of manufacturing the monomer of methacrylate.[57] This process is known as the "sulfuric-acid process. The investigators of the Department of Justice has been informed by Röhm & Haas officials that a license under the sulfuric-acid process would result in a saving to Philadelphia of several hundred thousands of dollars in the cost of producing monomer.

To date the negotiations between the two firms have not culminated in a settlement so far as this Department has been informed.

Analysis of prices of du Pont and Röhm, Philadelphia, on methyl methacrylate sheeting.—For the purposes of this analysis methyl methacrylate sheeting of 0.125 inch thick has been selected as the common factor since this is the generally accepted standard thickness and since it illustrates the trend for the other sizes. It should be noted, however, that the cast sheeting is manufactured in thicknesses ranging from 0.060 inch up to 0.500 inch.

In 1936, 1937, and 1938 Röhm & Haas, Philadelphia, alone was producing cast sheets in commercial quantities. It appears that Röhm & Haas did not adopt its present method of pricing until April 1937, at which time it charged $2.85 per square foot for 0.125 inch thickness, less a 10-percent discount for lots over 100 square feet; in May 1938 0.125 inch was reduced to $2.65, less 10 percent for over 100 square feet, making the quantity price $2.38 per square foot.

During 1938 du Pont was preparing to launch commercial production but did not announce prices to the trade until early 1939. On February 2, 1939, du Pont announced its price schedule which varied slightly from the Röhm & Haas prices. Du Pont priced its 0.125-inch Lucite at $3 per pound. In terms of pounds the Philadelphia price on 0.125-inch Plexiglas was $3.06. The prices du Pont set on

[55] Exhibit 55.
[56] Exhibit 56.
[57] Exhibit 57.

Digitized by Google

some of its thicknesses were slightly lower than Röhm & Haas' prices and in several cases were higher. In no case was the spread greater than $0.06 for any thickness. On February 6, 1939, Mr. Haas reported that Mr. Pitcher, of du Pont, had sent him the new price list for cast methacrylate sheets which he noted was in line with the Philadelphia prices.[58]

In May 1939 both du Pont and Röhm & Haas announced price reductions on cast sheets. The exact dates when these new prices were announced have not, as yet, been ascertained, but both du Pont and Röhm & Haas announced identical prices for all thicknesses. Both companies adopted special rates to the aircraft industry with another schedule of slightly higher prices for all other trades. The price for Lucite and Plexiglas of 0.125-inch thickness fell to $1.95 for the aircraft trade and $2.15 for other trades. It should be noted that du Pont at the time of this price change adopted the policy of quoting on the square-foot basis rather than the per pound basis as formerly.

No changes in price were effected until May 1941.

On Canadian sales there are a few documents which strongly indicate that du Pont and Röhm & Haas consulted each other on Canadian prices.

On May 13, 1941, Röhm & Haas announced a $0.25 per square foot price reduction, bringing the price on 0.125 inch down to $1.70 per square foot. This reduction was retroactive to May 1, 1941. Du Pont met this reduction with a similar revision on May 16, 1941, which was also retroactive to May 1. The new prices of both companies were identical.

It is indicative of price fixing that although du Pont's sulfuric acid process for making the methyl methacrylate monomer, which is the first stage in the production of cast sheeting, would result in a saving to Röhm & Haas of at least $130,000 a year and probably over $200,000 at present capacity, du Pont with this more economical process still has charged the same prices as Röhm & Haas. Röhm & Haas, Philadelphia, has cooperated with this department by supplying all requests for production costs, profits, and sales. Du Pont has refused access to their comparable data.

By way of summary then since May 1939, which was a few months after du Pont began production of Lucite, the prices of du Pont and Röhm & Haas have been identical on methyl methacrylate cast sheets. Together with identical prices, there has been rigid control of production.

It also should be noted that this investigation has discovered documents in the Röhm & Haas and du Pont files which unquestionably point to discussion of prices on two other forms of methyl methacrylate; namely, commercial molding powders, and cast rods. For example, on April 4, 1940, Mr. Kirsopp, of Röhm & Haas, visited the du Pont plant and reported as follows:[59]

"I saw McClellan and went over the question of their 75-cent price on solid methacrylate resins. I told him that we were putting a lot of effort into finding a market for some of these resins, and we could not afford to do it at that price, and were reluctant to do the work with the constant threat hanging over our head that after we had created a market the customers would buy du Pont resins. Mr. McClellan was, as usual, sympathetic, but his attitude was that as they are really not selling more than few hundred pounds a week he was unwilling to withdraw the prices and issue new ones. I left it with him that if at any time there was a change in the situation, if they put out additional resins of this type for use in lacquers, or if the use should give promise of expanding, they would get in touch with us and give us the opportunity of going over prices with them. This he promised to do—somewhat reluctantly."

The aspects of price fixing on the other methacrylate product; namely, denture materials, are handled separately in another part of this memorandum because there are specific agreements covering this particular product.

METHYL METHACRYLATE CAST SHEETING

CONCLUSIONS OF FACT

1. The agreement signed October 3, 1934, between I. G. Farben and Röhm & Haas, Philadelphia, constituted a pool of their United States and Canadian patents relating to the acrylates and methacrylates. The Philadelphia company agreed not to use these resins in the preparation of (1) photographic articles; (2) celluloid-like masses and products made therefrom; (3) dyestuffs; (4) artificial rubber; (5) pharmaceuticals; (6) abrasives.

[58] Exhibit 58.
[59] Exhibit 59.

Digitized by Google

I. G. Farben agreed not to market within the United States and Canada acrylic and methacrylic products for use in preparation of nonsplintering glass. Also the use of methacrylates as glass substitutes (e. g., cast sheets of methyl methacrylate) and of acrylates and methacrylates for adhesives were reserved to Philadelphia.

In May 1940 the agreement was modified so that the Philadelphia company could utilize the acrylates and methacrylates for photographic articles, abrasives, and celluloid-like masses. The restriction remained on the Philadelphia company as to their use in dyestuffs, artificial rubber, and pharmaceuticals.

2. The agreement between Röhm & Haas, Philadelphia, and Röhm & Haas, Darmstadt, signed in 1927, is relevant to the acrylic field since it provided that in case of later developed products the developing company was to acquaint the other party with a view of effecting an agreement whereby the other company would acquire the exclusive sales right within its territory.

3. The agreement of January 30, 1935, between Röhm & Haas, Darmstadt, and Röhm & Haas, Philadelphia, created a pool of their present and future United States patents, Canadian, and other foreign patents relating to the acrylates and methacrylates. The Philadelphia company received the United States and Canada as its exclusive markets and the rest of the world was reserved to Darmstadt. Pursuant to this agreement the Philadelphia company received Darmstradt's patents relating to the process of manufacturing Plexiglas.

4. The agreement executed by I. C. I. and du Pont in 1929, modified in 1934, and renewed in 1939, provided for cross-licenses on United States and foreign patents relating to numerous chemicals, including methyl methacrylate. North and Central America, exclusive of Canada and Newfoundland, were reserved to du Pont as its exclusive territory; the British Empire except for Canada was I. C. I.'s exclusive territory; and the remaining territory was open to both firms. By the 1934 modification the licensor retained the right to sell in the exclusive territory of the licensee but this right was never exercised.

5. The interference settlement made by du Pont and the Philadelphia company in 1936 was a cross-licensing agreement designed to avert litigation between these companies as to the validity of the patents and applications contained in the interferences. Documents written, both before and after the signing of the agreement, by the president of the Philadelphia company state that as to methyl methacrylate products the two coompanies agreed to consult each other on prices.

6. The agreement of 1939 between du Pont and Röhm & Haas, Philadelphia, provided for cross-licenses on process patents used in the manufacture of methyl methacrylate cast sheeting whereby the cast sheet production of the du Pont was limited to a certain monthly average, equaling one-half that of the Philadelphia company. As a result of this limitation, du Pont failed to meet the military demands for cast sheets during 1941.

7. Identical prices on methyl methacrylate cast sheeting have been charged since May 1939 by the Philadelphia company and du Pont as a result of their previous negotiations.

8. Cast sheets of methyl methacrylate and other methacrylic and acrylic products referred to in the aforesaid agreements have been sold and transported in interstate and foreign commerce.

SECTION III

Röhm & Haas, Philadelphia—du Pont Activities in Denture Field

Methyl methacrylate is today the basic material used in the majority of denture plates. This material has in the last 4 years largely superseded vulcanized rubber and other denture materials because of its lightness, strength, and adaptability to pigmentation.

In 1936 Vernon-Benshoff Co., of Pittsburgh, Pa., a dental supplies manufacturer, approached Röhm & Haas, Philadelphia, to inquire into the possibility of utilizing methyl methacrylate in the denture field. Extensive experimentation was carried on during 1936, 1937, and early 1938 by the Vernon-Benshoff Co. and Röhm & Haas which resulted in a formulation of methyl methacrylate suitable for the denture trade. Röhm & Haas sold methyl methacrylate polymer (the powder) and monomer (the liquid) to the Vernon-Benshoff Co., which added a pigment to the polymer to reproduce the natural gum color, mixed the polymer and monomer, thereby achieving a plastic material about the consistency of chewing gum. Vernon-Benshoff cut this gummy substance into a blank which was

Digitized by Google

packaged and sold to the dentist who in turn cut the blank into strips and molded them in an ordinary plaster mold.

In February 1938 Vernon-Benshoff was prepared to enter into commercial production of these blanks and so inquired of Röhm & Haas as to the existence of any controlling patents. As a result of the 1936 interference settlement between Röhm & Haas, Philadelphia, and du Pont, Röhm & Haas possessed a license under the Hill patent from du Pont which enabled it to license its customers to process the polymer or methyl methacrylate.

Du Pont owned the Tidd patent, No. 2,013,295, covering dentures made from polymeric methyl methacrylate, which had not been included in the 1936 settlement. However, it was the opinion of both Röhm & Haas and Vernon-Benshoff that the Tidd patent could be ignored as it covered merely the substitution of methyl methacrylate in place of other materials used in molding dentures. Furthermore, so long as the Tidd patent was du Pont's only patent in this field, du Pont made no effort to enforce it against Röhm & Haas, saving stated to Röhm & Haas that it had no objection to the Philadelphia company's use of acrylic resins in dentures so long as no third firm entered the field.

As a result, Vernon-Benshoff proceeded to market the plastic blanks and met with considerable success. The success of Vernon-Benshoff attracted other dental supply manufacturers to this product and sometime during 1938 the Detroit Dental Co. and several other houses began marketing methyl methacrylate dentures in a different form, i. e., Detroit Dental purchased the powder and liquid and then sold it in separate containers to the trade, leaving the mixing to the laboratories or dentists. This method of marketing met with the approval of the dental profession since it proved more economical to the dentist, who could use only as much material as the particular denture plate required. On the other hand, the plastic blank had a rather short "shelf life," i. e., had a tendency to dry out.

During the period of developmental work on methacrylate dentures, du Pont was considering marketing a methyl methacrylate denture made by the injection molding process which had been evolved by I. C. I. This process necessitated expensive and cumbersome injection molding machines and resulted in a denture inferior to that marketed by Vernon-Benshoff and Detroit Dental.

Du Pont became interested in the commercial success achieved by these houses. On June 7, 1938, United States Patent No. 2,120,006 issued to Strain, of the du Pont Co. This was both a product and process patent. The plastic blank achieved by mixing monomer and polymer of methyl methacrylate was patented and also there was covered the method of molding methacrylic resins by mixing the monomer and polymer. The Strain invention was a general molding patent making no particular reference to dentures. The process patented, however, covered the one used by the dental houses. Du Pont had not foreseen the possibilities of the Strain patent in the denture field but upon observing the success achieved by using this process in the dental field decided to monopolize the market. Accordingly, in May 1938 du Pont informed Vernon-Benshoff and Detroit Dental they were infringing du Pont's Tidd and Strain patents and ordered them to desist their activities.

Vernon-Benshoff approached du Pont in May 1938, apparently to attempt to become du Pont's distributor. Du Pont already had agreed to use L. D. Caulk Co., of Milford, Del., as its distributor but did not flatly refuse to consider Vernon-Benshoff. Mr. Vernon suggested an arrangement between Caulk and his own company whereby territory could be divided and sales and promotion work carried on by both companies. The pricing of dentures was also discussed by du Pont and Vernon-Benshoff.

Röhm & Haas was naturally concerned about the issuance of the Strain patent. There had been one of the Röhm & Haas applications in the 1936 interference settlement with du Pont which disclosed the basic concept but not the specific details of the Strain patent. If the 1936 agreement was liberally construed Philadelphia was automatically entitled to a license under the Strain patent, but if a narrow interpretation was adopted then Röhm & Haas was not so entitled.

Du Pont and Philadelphia argued this point but apparently never settled the issue of interpretation. Eventually it was decided that du Pont would license Philadelphia in return for certain considerations from Röhm & Haas. The first was a license from Röhm & Haas under its Chalmers patent relating to another of the methacrylic resins, and second, a tacit understanding that Röhm & Haas would not object to du Pont's receiving a license from I. G. Farben under the Fikentscher patent relating to a mixture of methacrylic acid and styrene. The latter patent was one of those contained in the I. G., Röhm & Haas, Philadelphia,

Digitized by Google

agreement of 1934 whereby Röhm & Haas received the exclusive rights in the United States, thus necessitating Röhm & Haas' consent to any license issued by I. G. to du Pont. At this time, the Vernon-Benshoff Co. repeatedly urged Röhm & Haas to reach an agreement with du Pont whereby Vernon-Benshoff Co. and Caulk Co. would be the exclusive distributors. Mr. Haas disagreed with Vernon-Benshoff and made an objection to du Pont that he did not wish to be limited to one distributor because he believed there was less likelihood of being accused of monopolizing the denture field and, furthermore, he wished wider distribution.

Du Pont finally consented to allow Philadelphia two distributors upon condition that methyl methacrylate be sold to the dental profession in plastic blanks only. The powder and liquid packages such as Detroit Dental Co. and other small houses marketed were to be withdrawn from the market. Du Pont was adamant upon this withdrawal of unmixed powder and liquid combinations because it was believed to be the only practical way of controlling the market.

While negotiations between Philadelphia and du Pont were being conducted, certain interoffice reports were made by W. W. Perry, sales manager of plastics department, to A. E. Pitcher, general manager of the plastics department of du Pont, to apprise him of the potentialities of the denture market.

Mr. Perry had been informed by Mr. Vernon, of Vernon-Benshoff, that approximately 6,000,000 dentures were sold yearly to the public. Vernon-Benshoff had sold vernonite to retail dealers at $2.50 per unit, who in turn had sold to dental laboratories and dentists at $4 per unit.

Du Pont estimated they could manufacture denture blanks at $0.15 per unit including material, labor, and overhead. However, an over-all cost of $0.25 to $0.30 per unit was allowed to cover research development, administration, etc. Du Pont decided to charge its distributor $1 per unit and sales and promotion would be handled by the distributor at a cost of about $0.50 per unit to the distributor.[60]

Du Pont estimated that its first year it would sell about 500,000 dentures at a gross profit of $400,000. J. A. Burchel, assistant general manager of the plastics department of du Pont, reported this profit estimate to a special meeting of the executive committee on October 27, 1938, and added:[61]

"I stated that the business and profit which we could forecast in dentures was our main reliance to place the Lucite operations on a profitable basis within the near future, * * *."

On the subject of a license to Röhm & Haas under the Strain and Tidd patents, Mr. Burchel said:[62]

"In the discussion of terms I stated, and was supported by Mr. Echols, that we should endeavor to maintain the maximum of control as to methods of distribution and price control if this could be legally and properly done.

"Mr. Lammot du Pont asked me if we had taken into consideration the recent New Deal attitude with relation to patent monopolies. I replied we had not, but that we felt that with patents which our legal department considered valid we were entitled to such a monopoly as patents ordinarily conveyed and that we were not aware of any general policy by other companies to take a different view."

The negotiations between du Pont and Röhm & Haas during the latter part of 1938 and early 1939 were concerned mainly with the reluctance of Mr. Haas to discontinue selling the unmixed powder and liquid methyl methacrylate. Mr. Haas expressed his desire to sell the monomer and polymer to Detroit Dental and Vernon-Benshoff at a price about the same as du Pont's price to Caulk. Du Pont refused to retreat from its previously announced position whereupon Haas threatened to attempt to break the du Pont patents. Du Pont was anxious to avoid such a contest.

Precisely why Röhm & Haas changed its course of action and accepted a license from du Pont whereby Röhm & Haas was to manufacture the blanks is not entirely clear, especially when it is realized that Mr. Haas had contended that he was automatically licensed under the Strain patent because of the disclosure in one of the Röhm & Haas applications in the 1936 interference settlement. Furthermore Röhm & Haas licensed du Pont under the Chalmers patent as well as consenting to a license from I. G. Farben to du Pont under the Fikentscher patent. Two factors tend to explain these con-

[60] Exhibit 60.
[61] Exhibit 61.
[62] Exhibit 62.

Digitized by Google

cessions to du Pont. First, the license du Pont received from I. G. under the Fikentscher patent restricted du Pont from using this patent in the manufacture of cast sheets. It should be noted that the Fikentscher patent related to a new mixture of synthetic resins which could be utilized in cast sheets as well as in many other forms. Second, Röhm & Haas and du Pont agreed upon the prices at which the methacrylate dentures were to be sold. On this last point a report by J. F. Bergin of Röhm & Haas on a conference held with du Pont attorneys on December 21, 1938, states: [63]

"* * * that we would consent to their having a full license under the Chalmers patent if the selling policies of the two companies could be brought into line."

Then on February 17, 1939, Mr. Bergin reporting on another conference held with Messrs. Gawthrop and Castle of du Pont, stated: [64]

"The matter of price fixing was briefly discussed. Du Pont may want to insert a clause giving them the right to fix prices on the dental blanks, but they have not made up their minds on this point. I told him that we had given some consideration to that but had concluded that the less said about price fixing the better. Mr. Castle stated that by putting a price-fixing clause into the agreement, possible future legal complications would be avoided. In this he is right, for it is legal to have a licensor fix the first sales price of a patented article. Mr. Castle suggested that any discussion of prices be by personal interview and not by correspondence."

Soon thereafter price fixing was settled, for Mr. Haas reported on April 14, 1939, that Mr. Wardenburg had called and—[65]

"He mentioned that Detroit Dental Manufacturing Co. are underselling Caulk in the New York market, and I think we have to stop this at once."

It should be noted that this was prior to the execution of the formal agreement with du Pont which was not signed until July 17, 1939.

Before the du Pont agreement was signed Röhm & Haas entered into practically identical distributor agreements on June 9, 1939, and July 3, 1939, with Vernon-Benshoff and Detroit Dental, respectively.

The agreement with the Detroit Dental Manufacturing Co.[66] recited that since Röhm & Haas had secured rights under du Pont's Strain and Tidd patents, therefore it was agreed that Röhm & Haas would manufacture the denture blanks of approximately 30 grams weight per unit and sell them to Detroit Dental.

Detroit Dental agreed to assign its trade name Crystolex to Röhm & Haas.

It was provided further that the sales policy, sales price, and all advertising relating to the denture bases were to be subject to the approval of Röhm & Haas.

Röhm & Haas granted Detroit Dental a sublicense under the Strain and Tidd patents to mold dentures from the mixtures purchased from Röhm & Haas and to sell throughout the United States, its territories and possessions but it was expressly agreed that Detroit Dental would not export denture base materials to any foreign country and would use its best efforts to prevent its customers from exporting this material.

Röhm & Haas agreed that if they should sell on more favorable terms than those granted under this contract to Detroit Dental, then those terms would be made available to Detroit Dental.

The agreement was to continue until June 7, 1955, and was signed by Otto Haas for Röhm & Haas and by Robert Kerr for Detroit Dental Manufacturing Co.

The agreement with Vernon-Benshoff was identically worded except that the trade name "Vernoite" was substituted for "Crystolex." [67]

The relationship between Caulk Co. and du Pont was never reduced to a formal agreement but was established by correspondence whereby Caulk was appointed exclusive distributor of Lucitone dentures. Matters such as prices, advertising, sales policies, etc., were to be worked out gradually.

On the matter of sales to the Government, du Pont stated: [68]

"While we prefer to have you handle all relations with the Government on Lucitone dentures, should the Government become dissatisfied and request the

privilege of buying direct from our company, either in the form of a compounded blank or in the form of monomer and polymer, we feel it is necessary in view of the du Pont Co.'s broad relationship with the Government to reserve the right to satisfy them."

DU PONT-RÖHM & HAAS DENTURE AGREEMENT

Soon after Röhm & Haas completed their distributor agreements du Pont and Röhm & Haas executed their agreement; it was signed on July 17, 1939, by A. E. Pitcher, general manager of the plastics department of du Pont and by Otto Haas, president of Röhm & Haas Co.[69]

(1) Four patents were included in the agreement, the Strain patent and Tidd patent, the first owned by du Pont, the second licensed to du Pont by Imperial Chemicals Industries, and two Chalmers patents owned by Röhm & Haas Co.

(2) Röhm & Haas received a general unrestricted license under the Strain patent for molding purposes other than for dentures.

(3) Röhm & Haas received from du Pont a nonexclusive royalty free license under the Strain and Tidd patents to make and sell for use in dental prosthesis molding mixtures of polymeric and monomeric methyl methacrylate to only Detroit Dental and Vernon-Benshoff. Röhm & Haas also received the right to sublicense these distributors under the Strain and Tidd patents to sell the mixtures throughout the United States.

(4) "* * * It is the intention of the parties that the facilities for distributing the said mixtures shall be approximately equal and it is agreed that either, in the event one or both of the above distributors should discontinue the sale of molding mixtures made by Philadelphia with the result of giving du Pont a substantial advantage in distributing facilities or in the event du Pont should increase the number of its distributors * * * then, for the purpose of again equalizing the distributing facilities of the two parties here * * * Röhm & Haas shall have a right to appoint a substitute or additional distributor or distributors the number of whom and the standing of whom in the trade may reasonably be expected to equalize again the distributing facilities of the two parties, but Röhm & Haas shall not appoint a substitute or additional distributor or distributors unless du Pont approves in writing * * *."

(5) Röhm & Haas agreed to sell the licensed mixtures only in substantially the same unit sizes as du Pont sold such mixtures and du Pont agreed to notify Röhm & Haas of any change in the unit size.

(6) Röhm & Haas granted du Pont a nonexclusive royalty free license under the Chalmers patents to practice the inventions described therein, and to manufacture and/or sell the products throughout the United States, together with the right to grant sublicenses to its customers to process materials purchased from du Pont.

(7) The agreement was to remain in effect until the expiration of the last patent included in the agreement.

The correspondence taken from the du Pont files brings out that I. C. I. wished to condition its permission to du Pont to grant a sublicense under the Tidd patent by a provision that Röhm & Haas and its distributors should not export either the powder and liquid methyl mathacrylate or the prepared blank. Du Pont pointed out it could not legally restrict Röhm & Haas since the latter was licensed under the Hill patent covering the polymer of methyl methacrylate and there was no patent on the monomer. However, I. C. I. was satisfied when informed that because of the agreements Philadelphia had with I. G. Farben and Darmstadt, exports of any acrylic were forbidden. That Philadelphia recognized this restriction is illustrated by the export provision in its distributor agreements with Vernon-Benshoff and Detroit Dental Co.

As a result of this agreement between du Pont and Rohm & Haas of July 17, 1939, rigid control was executed by du Pont over Röhm & Haas by restricting—

(1) The number of distributors, as well as designating the particular distributors for Röhms & Haas:

(2) The approximate portion of the market reserved to du Pont and Röhm & Haas;

(3) The exact size of the manufactured blank;

(4) The denial, inferentially, of the right to market unmixed combinations of powder and liquid methyl methacrylate;

[69] Exhibit 69.

Digitized by Google

(5) The territory within which Röhm & Haas and its distributors might sell.

Outside of the written agreement it is clear there was an oral understanding between du Pont and Röhm & Haas as to the prices to be charged. Both Röhm & Haas and du Pont sold plastic blanks to their sole distributors, Detroit Dental and Vernon-Benshoff for Röhm & Haas, and Caulk for du Pont, at $1 per unit, these distributors in turn sold to the dental retail dealers at $2.50 per unit, and the retail dealers sold to the dental laboratories and dentists at $4 per unit. Thus an identical price structure was maintained throughout the entire marketing process from manufacturer to the individual dentists.

It is reported that 75 to 80 percent of the dental retail dealers are members of the American Dental Trade Association, which apparently has restrictive provisions against retail price cutting by its members. If this is true, it would appear that the mere isssance of retail list price by Röhm & Haas and du Pont would be sufficient to maintain prices all the way to the consumer.

The Detroit Dental Co. (later the name was changed to Kerr Dental Co.) chafed under the rigid price control. Before the licensing agreements, Kerr Dental had sold at lower prices than those set by Röhm & Haas and du Pont. Kerr frequently urged price reductions, stating that the retail price could drop as low as $2.50 per unit and still a substantial profit could be made.

On the other hand, Vernon-Benshoff Co. opposed, as did Caulk Co., any reduction of prices, since it wished to realize the maximum of profit on methacrylate dentures before some new product might appear on the market which might displace methacrylate.

In accordance with its agreement with du Pont, Röhm & Haas discontinued sale of powder and liquid to Kerr Dental Co. and instead provided Kerr Dental Co. with the prepared blank.

Du Pont sent out letters to all dental manufacturers who were making methocrylate dentures, informing them they were infringing du Pont's patents and ordering them to desist. Since the only sources of supply of the monomer necessary in the making of dentures were du Pont and Röhm & Haas, both companies discontinued all sales of the monomer, continuing to sell without restriction the commercial molding powders used widely in industry for making auto dials and gages, and articles such as hairbrush backs, combs, etc.

However, du Pont and Röhm & Haas discovered that these small dental manufacturers utilized a process of "cracking" the polymer, i. e., powder, of methyl methocrylate to produce the necessary monomer. These small producers then used this monomer and the commercial molding powder purchased from du Pont or Röhm & Haas to supply a denture base which greatly undersold the products marketed by Caulk, Kerr, and Vernon-Benshoff. These bootleg products retailed from $0.50 up to $2.75 per unit. The largest bootleggers appear to have been Cosmos Dental Co., New York City; Acril Co., Brooklyn, N. Y.; Archer Dental Manufacturing Co., Chicago, Ill.; Acralite Dental Co., New York City; as well as several dozen very small concerns.

These companies were encouraged to enter the methacrylic denture field because of the artificially high prices exacted by du Pont and Röhm & Haas. These two companies marketed their methacrylate commercial molding powders at $0.85 per pound. Yet the methacrylate powder and liquid cost the dental laboratories and dentists $4 for a unit which weighs about 30 grams. Thus methacrylate when marketed for ordinary commercial purposes sold for $0.85 per pound but when sold for denture purposes cost the dental profession approximately $50 per pound. It is not surprising the independents were purchasing commercial molding powder and utilizing it in the denture field.

Because of the serious competition presented by the bootleggers, du Pont and Röhm & Haas began a vigorous campaign to locate these small producers and cut off not only their supplies of monomer but also their supplies of molding powder.

One major exception to the discontinuance of the sale of monomer was allowed in the case of Carbide & Carbon Chemicals Corporation. This corporation, through its subsidiary, Bakelite Dental Supply Co., marketed a denture base under the trade name of "Luxens 44," which was composed of a combination of vinylite and methyl methacrylate monomer. When Carbide & Carbon Co. requested du Pont to sell it monomer, the latter agreed for the following reasons:

(1) "The Strain and Tidd patents were not infringed."

(2) "As a large and powerful corporation, they could undoubtedly find some way to make a denture commercially acceptable and they might even find a way to make their own monomer."

(5) The territory within which Röhm & Haas and its distributors might sell.

Outside of the written agreement it is clear there was an oral understanding between du Pont and Röhm & Haas as to the prices to be charged. Both Röhm & Haas and du Pont sold plastic blanks to their sole distributors, Detroit Dental and Vernon-Benshoff for Röhm & Haas, and Caulk for du Pont, at $1 per unit, these distributors in turn sold to the dental retail dealers at $2.50 per unit, and the retail dealers sold to the dental laboratories and dentists at $4 per unit. Thus an identical price structure was maintained throughout the entire marketing process from manufacturer to the individual dentists.

It is reported that 75 to 80 percent of the dental retail dealers are members of the American Dental Trade Association, which apparently has restrictive provisions against retail price cutting by its members. If this is true, it would appear that the mere isssance of retail list price by Röhm & Haas and du Pont would be sufficient to maintain prices all the way to the consumer.

The Detroit Dental Co. (later the name was changed to Kerr Dental Co.) chafed under the rigid price control. Before the licensing agreements, Kerr Dental had sold at lower prices than those set by Röhm & Haas and du Pont. Kerr frequently urged price reductions, stating that the retail price could drop as low as $2.50 per unit and still a substantial profit could be made.

On the other hand, Vernon-Benshoff Co. opposed, as did Caulk Co., any reduction of prices, since it wished to realize the maximum of profit on methacrylate dentures before some new product might appear on the market which might displace methacrylate.

In accordance with its agreement with du Pont, Röhm & Haas discontinued sale of powder and liquid to Kerr Dental Co. and instead provided Kerr Dental Co. with the prepared blank.

Du Pont sent out letters to all dental manufacturers who were making methocrylate dentures, informing them they were infringing du Pont's patents and ordering them to desist. Since the only sources of supply of the monomer necessary in the making of dentures were du Pont and Röhm & Haas, both companies discontinued all sales of the monomer, continuing to sell without restriction the commercial molding powders used widely in industry for making auto dials and gages, and articles such as hairbrush backs, combs, etc.

However, du Pont and Röhm & Haas discovered that these small dental manufacturers utilized a process of "cracking" the polymer, i. e., powder, of methyl methocrylate to produce the necessary monomer. These small producers then used this monomer and the commercial molding powder purchased from du Pont or Röhm & Haas to supply a denture base which greatly undersold the products marketed by Caulk, Kerr, and Vernon-Benshoff. These bootleg products retailed from $0.50 up to $2.75 per unit. The largest bootleggers appear to have been Cosmos Dental Co., New York City; Acril Co., Brooklyn, N. Y.; Archer Dental Manufacturing Co., Chicago, Ill.; Acralite Dental Co., New York City; as well as several dozen very small concerns.

These companies were encouraged to enter the methacrylic denture field because of the artificially high prices exacted by du Pont and Röhm & Haas. These two companies marketed their methacrylate commercial molding powders at $0.85 per pound. Yet the methacrylate powder and liquid cost the dental laboratories and dentists $4 for a unit which weighs about 30 grams. Thus methacrylate when marketed for ordinary commercial purposes sold for $0.85 per pound but when sold for denture purposes cost the dental profession approximately $50 per pound. It is not surprising the independents were purchasing commercial molding powder and utilizing it in the denture field.

Because of the serious competition presented by the bootleggers, du Pont and Röhm & Haas began a vigorous campaign to locate these small producers and cut off not only their supplies of monomer but also their supplies of molding powder.

One major exception to the discontinuance of the sale of monomer was allowed in the case of Carbide & Carbon Chemicals Corporation. This corporation, through its subsidiary, Bakelite Dental Supply Co., marketed a denture base under the trade name of "Luxens 44," which was composed of a combination of vinylite and methyl methacrylate monomer. When Carbide & Carbon Co. requested du Pont to sell it monomer, the latter agreed for the following reasons:

(1) "The Strain and Tidd patents were not infringed."

(2) "As a large and powerful corporation, they could undoubtedly find some way to make a denture commercially acceptable and they might even find a way to make their own monomer."

Digitized by Google

(3) "By selling them we should retain a reasonable degree of copperation and goodwill, whereas in refusing to sell them the opposite would be true."

(4) "In selling them we believe it will be legal to obtain an agreement not to resell methyl methacrylate monomer as such and to market it in dentures in a colloided form" (excerpt from letter of December 19, 1939, from du Pont to Caulk).[70]

As a result of the removal from the market of the Detroit Dental Co.'s unmixed powder and liquid combination, together with the high prices charged by the licensed distributors, the dental profession was critical of the stand taken by du Pont and Röhm & Haas. The American Dental Association, Chicago, Ill., vigorously protested the removal of the Detroit dental unmixed powder and liquid combination, as did the American Full Denture Society. Du Pont attempted to placate them by stating that most dentists were not sufficiently educated in the chemistry of the methacrylates to safely compound them.

As another aspect of their campaign against the unlicensed manufacturers, du Pont and Röhm & Haas issued circular letters to the dental profession and dental laboratories pointing out the dangers of using unlicensed materials which might contain materials injurious to the patient's health. This program received a serious setback in September 1940 at the American Dental Association meeting when Dr. Paffenberger, of the United States Bureau of Standards, read a paper analyzing the physical properties of the various acrylic denture materials. He stated there was little difference between the licensed and unlicensed materials. This practically destroyed the argument of the licensed distributors attempting to justify the wide price differential beween the licensed and unlicensed denture materials.

As a follow-up on its notices of infringement, du Pont instituted a patent-infringement suit against Cosmos Manufacturing Co. in October 1939. The Cosmos company contested the validity of the Strain and Tidd patents, but the suit never reached trial as it was dismissed in December 1940 without prejudice to either party and without assessment of costs.

In response to the widespread criticism of the dental profession, du Pont, in April 1940, authorized the licensed distributors to return to the market the unmixed monomer and polymer denture materials at a slight reduction in prices. Identical prices were quoted by Röhm & Haas to Kerr, and Vernon-Benshoff, and by du Pont to Caulk. A letter[71] from Röhm & Haas to both of its distributors specifically stated the following prices were to be charged: One to nine units: Price to distributor, $1; wholesale price, $2.40; retail price, $3.60. Ten-unit boxes; To distributors, $0.90; wholesaler's price, $2.25; retailer's price, $3.25. However, the trade continued to protest about high prices.[71]

Denture Sales in Canada

In May 1938 du Pont had assigned the Canadian rights in the Strain patent to Canadian Industries, Ltd. C. I. L. had also received the Canadian rights in the Tidd patent from I. C. I. Thus when Röhm & Haas' distributors wished to market their denture materials in Canada it was necessary to receive licenses from C. I. L.

On June 5, 1940, Röhm & Haas entered into an agreement[72] with C. I. L. whereby the former received a nonexclusive license under the Canadian Strain and Tidd patents to market denture bases through Vernon-Benshoff and Kerr Dental.

Röhm & Haas and the distributors were not to manufacture the materials in Canada.

A royalty figured on the "mill cost" to Röhm & Haas was to be paid by Röhm & Haas to C. I. L.

Röhm & Haas also agreed not to attack the validity of the enumerated patents during the term of the agreement, which was to last until the expiration of the last of aforementioned patents.

In turn Röhm & Haas sublicensed its distributors, Vernon-Benshoff and Kerr Dental, to sell in Canada dental molding mixtures manufactured by Rohm & Haas.

Kerr and Vernon-Benshoff agreed that the sales policy, sales prices, and advertising were to be subject to the approval of Röhm & Haas.

Both distributors agreed to pay Röhm & Haas one-half of the royalty paid by Röhm & Haas to C. I. L. on sales of Vernonite and Crystelex.

Du Pont's arrangements in Canada were to sell the denture base materials to C. I. L., who in turn sold them to Caulk for distribution throughout Canada.

Other Export Trade

Since the denture base materials were methyl methacrylate they were subject to the restrictions on exports as set forth in the agreements Röhm & Haas, Philadelphia, entered into with I. G. Farben in 1934 and with Darmstadt in 1935, Philadelphia refused to allow its distributors to export until Darmstadt found itself cut off from its export markets after the outbreak of the war in 1939. At that time permission was given to the distributors to export for the duration of the war. However, Paladon, Ltd., of Rio de Janeiro, Brazil, apparently was a sizable customer of Darmstadt and Philadelphia sold directly to this firm, instead of through its distributors, and supplied it with methyl methacrylate monomer and polymer.

The division of world territories set up in the agreement du Pont signed with I. C. I. in 1929 and renewed in 1939 controlled the export of denture base materials. Du Pont refused Caulk permission to export denture bases to I. C. I.'s exclusive territory. Specific inquiries and orders from Australia, New Zealand, and South Africa were turned down by du Pont and referred to I. C. I.[73] After the war began in September 1939 at I. C. I.'s request, du Pont began supplying markets formerly part of I. C. I.'s exclusive territory for the duration of the war.

Relations of Röhm & Haas With Winthrop Chemical Co.

The agreement Röhm & Haas signed with I. G. Farben in 1934 entered into the denture field in a rather peculiar manner. Under the terms of this agreement I. G. had reserved to itself the exclusive United States rights on the application of acrylics in the pharmaceutical field. No mention was made of their use in the denture field. At a later date Winthrop Chemical Co. received I. G.'s rights in the United States in the pharmaceutical field. Winthrop attempted to interpret the term "pharmaceutical" to include "dentures," and so informed Röhm & Haas. The latter had already begun commercial exploitation of the denture-base field and so refused to vacate in favor of Winthrop. Apparently in order to maintain friendly relations with I. G. it was agreed that Röhm & Haas would attempt to formulate for Winthrop a denture base material derived from I. G.'s Fikentscher patent, and beginning October 1939 until such time as a satisfactory material was manufactured Röhm & Haas agreed to pay Winthrop $500 per month. The production of a satisfactory material was accomplished by March 1940 and in accordance with its agreement Röhm & Haas paid Winthrop $2,500.

This material was sold to Winthrop at cost plus 10 percent—the regular price to I. G.'s "friendly firms." The conditions Röhm & Haas attached to this price were consumption of at least 1,000 pounds per month and as stated in a letter of May 27, 1940,[74] from John F. Bergin to Mr. McClintock, of Winthrop, "* * * your getting this price also presupposes that you will cooperate with us in the denture field."

Modification of the du Pont-Röhm & Haas Denture Agreement

With the return to the market of an unmixed powder and liquid combination, the patent attorneys of du Pont concluded that du Pont could not legally control the sales of liquid and powder since in an unmixed state they were outside the scope of the Strain and Tidd patents. Accordingly on April 1, 1940, du Pont authorized Caulk Co. to send out a circular announcement to all dental laboratories and dentists offering them a royalty-free license under the Strain and Tidd patents insofar as they related to dentistry. The dentist or laboratory was free to obtain his material from any source. One exception was made, namely, that the licensee did not receive the right to sell plastic blanks of methacrylate—this was to protect Lucitone and Vernonite.

As a result of this free license Cosmos and all other dental houses marketing unmixed monomer and polymer were not infringing the Strain and Tidd patents. As previously noted the suit against Cosmos was eventually dropped.

Somewhat later, on February 11, 1941,[75] the agreement of July 17, 1939, between Röhm & Haas and du Pont was canceled and in its place was substituted an agreement whereby du Pont granted Röhm & Haas licenses under the Strain and Tidd patents without restrictions as to distributors or size of denture blank to be manufactured by Röhm & Haas. The right to grant sublicenses to its customers was also given to Röhm & Haas.

[73] Exhibit 73 *a, b, c.*
[74] Exhibit 74.
[75] Exhibit 75.

Digitized by Google

The provisions of the license to du Pont from Röhm & Haas under the Chalmers patent remained unchanged.

The distribution of the denture base materials continued through the same channels—Kerr Dental, and Vernon-Benshoff, for Röhm & Haas, and Caulk for du Pont. Identical prices continued to be charged. Control over the denture field continued to be exerted by Röhm & Haas and du Pont. Since they alone manufactured methyl methacrylate the independent, unlicensed manufacturers of denture base materials were completely dominated by these two firms. The competitive pattern was unchanged for the former so-called bootleggers, although du Pont had recognized that they were not infringing the Strain and Tidd patents. Du Pont and Röhm & Haas continued to refuse all orders for monomer with the expressed purpose to put the independents out of business. Further, the two firms actively policed all sales of commercial molding powder by requiring all purchasers to sign a license agreement [76] providing—

(1) they would not resell the powder in the same form as purchased;
(2) nor would they use it in the manufacture of dentures;
(3) these purchasers had to agree to furnish proof at any time that they were conforming to this agreement; and
(4) they recognized the right reserved by du Pont and Röhm & Haas to discontinue sale to them of this product for any reason.

The effect of this boycott by Röhm & Haas and du Pont rendered meaningless the free licenses issued by du Pont since if only the materials distributed through Kerr, Vernon-Benshoff, and Caulk were to be available, there was no need to license the dental profession under the Strain and Tidd patents since all purchasers would come from already licensed distributors.

The sales reports from the distributors during the early part of 1941 indicate there was a noticeable decline in the business of the independents since they were no longer able to obtain supplies of monomer and polymer.

Cosmos Dental Products, Inc., when faced by this situation threatened to expose du Pont's activities to the Department of Justice. Not long thereafter du Pont offered to license Cosmos on a royalty basis under the Hill patent covering the polymer of methyl methacrylate if the Cosmos company could invent a method of making methyl methacrylate not covered by du Pont patents. However, du Pont refused to license Cosmos under any of its patents relating to the process of manufacturing methyl methacrylate. The outcome of these negotiations is not presently known.

Government Orders

In the spring of 1941 both the Army and the Navy became interested in obtaining quantities of denture materials. The Navy invited bids on a contract for 400 10-unit packages of denture base. Kerr, Caulk, and Vernon-Benshoff submitted identical bids of $22.50 per package [77] whereas the only other large supplier, Acralite Co., bid $7.26 per package, approximately one-third as much as the bids of the "Holy Three," as Kerr, Vernon-Benshoff, and Caulk were often termed by the dental trade. April 4 the Navy rejected all bids and the purchase request was canceled.

In May, Philadelphia advised its distributors there would be a reduction in the price on a pending denture contract of the Army. The amounts bid and the disposition of this contract is not at present known since these transactions occurred after the completion of the Department's investigation.

DENTURES

Conclusions of Fact

1. The agreement of July 17, 1939, between du Pont and Röhm & Haas, Philadelphia, provided for cross licenses under two du Pont-controlled patents dominating the denture field and under two Röhm & Haas patents not pertaining to dentures. Röhm & Haas, Philadelphia, was restricted to two specified distributors and also was restricted as to the type and size of denture unit to be marketed.

2. Röhm & Haas, Philadelphia, and du Pont, manufacturers, and Kerr Dental Manufacturing Co., Vernon-Benshoff Co., and L. D. Caulk Co., distributors, have

[76] Exhibit 76.
[77] Exhibit 77.

Digitized by Google

agreed upon the prices charged to the distributors, wholesalers, and retailers, since the early part of 1939.

3. Du Pont and Röhm & Haas, Philadelphia, as the sole producers of methyl methacrylate, have attempted to eliminate competition in the acrylic denture field, by their agreement to refuse all sales of raw materials to independent manufacturers of methyl methacrylate denture bases.

SECTION IV

Röhm & Haas, Philadelphia South American Trade

From the early twenties until the outbreak of the present war the export business of Röhm & Haas Co., Philadelphia, was very small.

A review of the various agreements pertaining to the more important products introduced and marketed by the company during this period will give one a clearer understanding of the basis for Philadelphia's export policy. Attention need be focused only on the provisions of the agreements wherein R. & H.'s market territory is defined.

In 1922, Röhm & Haas, Philadelphia, entered into a patent agreement with Badische Anilin & Soda Fabrik, Baden, German (now I. G. Farbenindustrie A. G.) whereby Philadelphia received the exclusive right, under the German firm's patents, to manufacture and sell synthetic tanning materials in the United States and Canada only.[78]

In 1927 Philadelphia by agreement by R. & H., Darmstadt provided for a world division of market territories. This agreement pertained particularly to products manufactured and sold by parties at this date, for example, Oropon, a product employed in the tanning trade. However, provision was made for products developed thereafter. In such case the developing party was to offer the other party the exclusive rights of sale in his territory. If this could not be accomplished, other arrangements could be made to enable the party, who invented the product, to sell in the territory of the other but refrain from using the firm name.

In June 1934 Philadelphia executed a patent agreement with Theo. Goldschmidt Corporation, an American subsidiary of a German firm of the same name.[79] By the terms of this agreement Philadelphia received a license under patents assigned to the Theo. Goldschmidt Corporation, by its parent German firm for the manufacture and sale of Tego gluefilm, within the United States and Canada.

The Röhm & Haas Co., Philadelphia, then assigned to its affiliated company, Resinous Products & Chemical Co., Inc., Philadelphia, all patent rights received under the above-named agreement. Tego is a gluefilm used as a bonding agent in the manufacture of plywood and is used extensively in the aircraft and marine fields.

In October 1934 Philadelphia and I. G. Farbenindustries A. G., cross-licensed each other under their respective patents covering the preparation and application of acrylic and methacrylic acid. The territory reserved to Philadelphia was the United States and Canada.

In November 1934 Philadelphia Co. and R. & H., Darmstadt executed a contract whereby Philadelphia Co. was granted the exclusive right under Darmstadt's patents to manufacture and sell acrylic and methacrylic acids and their derivatives. Philadelphia's activities were restricted to the United States and Canada.

In August 1938 Philadelphia was granted permission by R. & H., Darmstadt to export a product covered by the above-mentioned Darmstadt patents, i. e., Plexiglas, but only in the form of replacement parts for airplanes manufactured in the United States. This concession was granted, however, subject to the payment to Darmstadt of a royalty commission of 10 percent on the sale.

It can readily be observed from the above agreements, that Philadelphia's business in the synthetic tanning and plastics fields is wholly dependent upon the right to manufacture such materials under patents owned by German firms. The licensors having restricted Philadelphia's activities to the United States and Canada, left the South and Central markets open for German exploitation.

With the outbreak of the present war, the British blockade made it impossible for the German firms to supply the South and Central American markets with German-made goods; therefore, Philadelphia and its affiliated firm, Resinous

[78] Exhibit 78.
[79] Exhibit 79.

Digitized by Google

Products & Chemical Co., Inc., were called upon to provide the requirements of the German agents.

Under the above arrangements Philadelphia and its affiliated firm are permitted, for the duration of the war, to supply the South American markets, but they are obliged to pay the German firms, in addition to their regular royalty fee, a certain commission on all sales in such countries.

Shortly after the outbreak of hostilities, i. e., September 14, 1939, Röhm & Haas, Darmstadt requested Philadelphia to supply the licensor's agents in Middle Central and South America, Japan, and China, with the above-mentioned product. However, subject to following provisions:

1. The regular license royalties to be paid on all Plexiglas sold in above countries;
2. An additional 15 percent commission would be paid on all sales of Plexiglas to the German agents;
3. That the arrangement was to terminate promptly when the German firm could again supply these markets.

The above proposal was not immediately accepted by Philadelphia because they were not certain they could sell at Darmstadt's prices, nor could they allow 15-percent royalty or commission on such sales.

Pursuant to an arrangement whereby Röhm & Haas, Darmstadt would receive a royal figured on a sliding scale on the thickness of Plexiglas, range to be from 3 to 25 percent, Röhm & Haas, Philadelphia, sold Plexiglas in such markets.

An arrangement similar to the one above was put into operation by Philadelphia for the sale of synthetic tanning materials to the representatives of I. G. Farbenindustrie in Central and South America.

Pursuant to the agreement made in 1922 with Badische Aniline & Soda Fabrik (now I. G. Farbenindustrie), Röhm & Haas Co., Philadelphia, was prevented from exporting synthetic tans to the world markets. However, the British blockade instituted after the declaration of war in September 1939 forced I. G. Farben to look to another method of supplying its world markets, especially South America. Therefore, I. G. wrote to Röhm & Haas Co., Philadelphia, on December 22, 1939, stating:[80]

"The arrangements we have with your firm about synthetic tanning limits the markets where you are free to sell your synthetic tannings to the United States of America and Canada, whereas we supply the rest of the world * * *. Most of these markets can at present not be supplied by us regularly and in order to allow our friends in those markets to maintain their position, we should very much appreciate if you could supply them * * *.

"We have therefore informed our friends in the South and Middle American States to approach you through the Advance Solvents Chemical Corporation, New York. * * *."

Mr. Haas, President of Röhm & Haas Co., Philadelphia, replied in the following vein on January 22, 1940:[81]

"I am in receipt of your letter of December 22. Of course, we shall be glad to follow your wishes in every detail.

"I attach herewith a list of the shipments which we have already made to Bogota, Lima, and Rio. These orders have come to us entirely unsolicited and we thought it in your best interest to fill them.

"I wish to assure you that no matter who is doing the shipping we shall revert to the status quo antem as soon as normal conditions have been restored. The thought uppermost in my mind is to serve you in the most faithful and most efficient way possible in this emergency."

A like arrangement was effected between Theo. Goldschmidt A. G. of Essen, Germany, with Resinous Products & Chemical Co., Philadelphia, for the sale of Tego gluefilm in Central and South America.

On January 22, 1940, the Resinous Products & Chemical Co. wrote to Theo. Goldschmidt Corporation of New York City stating[82]—

"We note from the enclosures contained in your letter of January 18, that Essen is apparently referring their South American inquiries to us. Will you please advise us whether we are now free to make shipments to South America?

"We have also had one or two inquiries from Mexico and we would also like to know whether or not we are free to make shipments to that country. Since

[80] Exhibit 80.
[81] Exhibit 81.
[82] Exhibit 82.

Digitized by Google

this matter is fairly urgent as far as one Mexican customer is concerned, we would be obliged if you would give us as prompt a reply as possible."

The next day the following reply was received from Theo. Goldschmidt Corporation.[83]

"Replying to your letter of January 22, we shall be pleased to have you supply Tego Resin Film to Mexico and South America until further notice."

During 1939 Philadelphia's export sales averaged about $29,300 per month, and in 1940 about $34,900 per month, which indicates that the increase can be directly related to the releasing of export restrictions by the German firms.

The net effect of such arrangement appears to be the preservation of the German economic position in such materials, to the detriment of legitimate American competition, for further German exploitation in South America upon the termination of the hostilities.

Since late 1940 Röhm & Haas state they have not been accepting new business from any firms on the British blacklist, and are dropping longtime agents in such places as Columbia, Mexico, and Peru who are suspected by the Department of Commerce of being pro-Nazi.

In connection with their South American shipments, Philadelphia have laid down the following restrictions in their export department to which they claim to be carefully adhering:

1. Shipping papers must always show the name of the real purchaser.
2. No shipment can be reexported, but must be used in the country to which it is shipped.
3. They ascertain that the articles shipped are of a kind required for use in the country of destination.
4. Export licenses must be secured in all cases where there is the slightest possibility of an export license being required.

Under date of April 26, 1941, Philadelphia addressed letters to several firms in South America, including those in Columbia and Peru who were suspected of being pro-Nazi. The letters stated that on account of increasing shortages of important raw materials, the Philadelphia company will be unable to continue making shipments of various chemicals used in the tanning and textile industry.

But the emergency arrangements may still be operative, particularly in view of the contents of a letter dated May 23, 1941, obtained from the files of the E. I. du Pont de Nemours & Co., in which Harry Kaufman, distributor for the du Pont Co. in Caracas, Venezuela, states:

"Furthermore, I ran across a steel drum of Ind. Red, which had been shipped from the U. S. A., and was marked E. G. This mark of course is some fake mark and I have observed that recently Röhm & Haas, Philadelphia, has shipped merchandise to Venezuela, under the mark E. G. and this was consigned to Blohn & Co., La Guayra. Blohm & Co. and the I. G. are good friends, so you know for any future reference this connection, and there is no doubt that all such merchandise is received by the I. G.

"I. G. or La Quinica-Bayer-Westkott & Cia., have been appointed agents for Röhm & Haas, in Philadelphia for Venezuela. I understand that this is a general hook-up between I. G. and Röhm & Haas, and please check this up with your other agents, to find out whether in such Central or South American countries, the I. G. also handles Röhm & Haas lines.

"They also receive their Hydro-sulphite (Blankit) from Röhm & Haas, in 50-kilo drums, repack it in 10-lb. tins in Venezuela and mark it "Blankit." You see, they are using United States' made merchandise to keep their German trade names on the market. Perhaps this information may interest at any time. It might be interesting to check up on Röhm & Haas and find out how far they go in helping the German trade in South America, by furnishing them with material made in the U. S. A. Soon I hope to be able to give you more information and also send you the samples of dyes promised to you."

Röhm & Haas, Philadelphia, South American Trade

Conclusions of fact.—1. On or about November 26, 1939, Röhm & Haas, Philadelphia, and Röhm & Haas, Darmstadt, entered into a supplemental agreement to their agreement of November 24, 1934, whereby they agreed to a division of territory for the sale of Plexiglas for the duration of the war, by giving Röhm

[83] Exhibit 83.

Digitized by Google

& Haas, Philadelphia, the right to sell in Central and South America, Japan, China, and Siam for that period only, it being agreed that the market is to be returned to Röhm & Haas, Darmstadt, at the end of the war.

2. On or about January 22, 1940, Röhm & Haas, Philadelphia, and I. G. Farben, Frankfurt am Main, Germany, entered into a supplemental agreement to their agreement of October 30, 1934, whereby they agreed to a division of territory for the sale of synthetic tans and other tanning materials for the duration of the war by giving Röhm & Haas, Philadelphia, the right to sell in Central and South America for that period only, it being agreed that the market is to be returned to I. G. Farben at the end of the war.

3. On or about January 23, 1940, the Resinous Products & Chemical Co., of Philadelphia, and Theodore Goldschmidt, A. G. of Essen, through its New York representative, Theodore Goldschmidt Corporation, entered into a supplemental agreement to their agreement of June 19, 1934, whereby they agreed to a division of territory for the sale of Tego-gluefilm for the duration of the war by giving the Resinous Products & Chemical Co., Philadelphia, the right to sell in Mexico and South America for that period only, it being agreed that the market is to be returned to I. G. Goldschmidt, A. G., at the end of the war.

SECTION V. SUMMATION

By way of summary, then, this investigation has exposed the manner by which Röhm & Haas Co., Philadelphia, and E. I. du Pont de Nemours, Inc., of the United States, Imperial Chemical Industries, Ltd., of Great Britain, and I. G. Farbenindustrie, and Röhm & Haas, Darmstadt, of Germany, have erected an international cartel in one field of plastics by utilizing secret patent pools and cross licenses providing for restrictions on production, price fixing, and elimination of potential competitors.

Since the most important product covered by these patent agreements, that of methyl methacrylate cast sheeting, is an indispensable war material for the production of all military airplanes, it is imperative that all restrictive patent controls over this product be removed. With the production of this cast sheeting concentrated in the hands of only two producers who gained that control by illegal methods, it is in the interest of the Nation that other individuals and firms have these patents made available to them should they desire to engage in production of this material.

In addition the evidence drives home the point that there is extreme danger to the Nation in allowing private individuals and concerns to enter into patent and marketing agreements with foreign producers with no supervision by the United States Government.

These agreements have not only violated the antitrust laws but have also forced their signers into a position opposing the enunciated foreign policy of this Government.

The growth of international and domestic cartels destroying free competitive markets must be vigorously uprooted.

The Antitrust Division has presented the evidence pertaining to merely one type of plastic for purposes of clarity, but it should be understood that this is not an isolated or extraordinary case. The Antitrust Division possesses evidence showing that it is illustrative of the situation existing in most of the important plastics.

EXHIBIT NO. 5

A NATIONAL POLICY FOR INDUSTRY

INTRODUCTION

The following statement puts forward certain views and recommendations as to the place which industry should occupy in the framework of society. It is offered by a group of industrialists as a contribution to current discussions of reconstruction. The signatories are closely connected with a wide range of British Manufacturing Industry and believe (though they have made no attempt widely to canvass others and make no claim to speak for anyone but themselves) that their views will command a large measure of support. Such a statement seemed to them called for, on the one hand as a declaration of what they conceive to be their duty to the community and on the other as a claim to recognition by the community of the aims and achievements of industry. It may help too to

Digitized by Google

strengthen that faith in the future of Great Britain which is so essential to the successful prosecution of the war.

The present struggle is one not only against aggression, but for freedom, and President Roosevelt's words, "Freedom from want which, translated into world terms, means economic understanding which will secure to every nation a healthy peacetime life for its inhabitants everywhere in the world," are applicable to domestic as much as to international relations.

As a producer, industry is by far the largest contributor to the material welfare of the nation. It has a threefold public responsibility: to the public which consumes its products, to the public which it employs, and to the public which provides the capital by which it operates and develops. The underlying conviction on which the whole of this document is based is that the spirit which should animate industry is service to the community as a whole.

The signatories believe that industry can be so organised, internally and in relation to the State, that this threefold responsibility can be effectively discharged, and the idea of service carried more fully into practice, without embarking upon changes in the social system such as might seriously and detrimentally dislocate the working basis of the national economy.

They wish to stress that they speak only as industrialists; that is to say, as persons whose experience is of the management and policy of manufacturing and producing enterprises. They do not speak for Agriculture. It is fully recognised that Agriculture is the largest branch of production; its problems, however, are different and distinct. Nor do they essay to deal with the problem of the distributor, merchant, broker, financier, banker, or insurer, whose activities differ materially. These various interests are, however, alike in this, that they all have their associated contributions to make to the welfare of the nation, and in their activities they must all be subject to the same criterion of service to the community.

Equally, the signatories do not purport to deal with the highly important question of monetary policy and international exchange. Whilst these are of cardinal importance they do not fall within the scope of the matters discussed in this statement.

The largest single section of the national capital in this country on which employment depends is devoted to Manufacturing Industry. Manufacturing Industry provides employment for a considerable proportion of the population and pays a substantial part of the national taxation. Manufacturing Industry claims, therefore, to have a primary importance for the community and ought to acknowledge a commensurate responsibility to the community.

The signatories emphasize that this is a preliminary statement only. It sets out their suggestions on broad lines and avoids detail, which in a general statement would be merely confusing. It is hoped in subsequent statements to amplify and illustrate the general principles here outlined.

The statement is divided into four sections—

Section I reviews the achievements of industry, outlines the problems which it will have to face after the war, and indicates the social and other obligations which it will have to assume if it is to solve these problems successfully and to discharge its threefold public responsibility.

Section II discusses the various forms or frameworks within which industry can function and their appropriateness to the general conception outlined in section I.

Section III indicates the general lines upon which, in furtherance of industry's aims as defined, the closer organisation of industry could proceed.

Section IV states the steps which the signatories have taken to bring their proposals nearer to fulfillment. These include the appointment of a committee to examine in much closer detail the general questions discussed in this statement, to collaborate with other interested parties, and to confer with the existing national associations and federations. Their ultimate task is to report upon the specific action which is called for, so that proposals may in due course be placed before the Government.

As is indicated in the body of this statement, the signatories recognise the very valuable work which has already been done in this field by existing organisations and hope that the suggested collaboration with them will lead to a closer association and identity of views.

I. GENERAL SURVEY

Modern industry has grown up under the system of private enterprise, or, as it is often called, the capitalist system. Its essence is the right enjoyed by all

Digitized by Google

members of the community, whether individual, corporation, or cooperative society, from the small saver to the big investor, from the small craftsman to the large manufacturing combine, to employ or invest their savings or property in any business of their choice.

Under the system of capitalist enterprise industrial production has over the past hundred years made immense strides, as a result of which the problem of scarcity resulting from underproduction has receded. The continuous development of new inventions and processes has brought about an immense expansion in the quantity and range of industrial products, together with a corresponding and progressive reduction in costs and prices. The direct result has been a great increase in the real wealth of every section of the community. Indeed the progress made in industry would suffice in itself for a still greater increase in real wealth, were it not for difficulties arising in the field of exchange and distribution. It is industry which principally creates the material basis of the nation's standard of living, a standard surpassed or equalled by that of very few other countries.

To achieve such results demands qualities of imagination, boldness, and resource in facing great and complex problems of many kinds—problems in technical development, in management and policy, in relations with labour, in the conduct of international trade negotiations, in intraindustrial relations and in relation to state policy. We claim that industry under the system of private enterprise has in fact shown these qualities and, through the work of individual firms large and small and latterly of its representative bodies, has made a great contribution to the well-being of the community. This fact is seldom acknowledged, and all too inadequately recognised.

The structure of industry varies with the varying technical and commercial needs of different trades. It has developed in a number of different forms: Private ownership under the personal management of the proprietors or partners; cooperative societies; the small joint-stock company, with the principal director often the principal shareholder; large companies, and also groupings of companies, with thousands of individual shareholders and under professional direction and management. The tendency of late years, with the increase in the size of business units, has been to enhance the directors' and managers' sense of responsibility to the community, and, although this is perhaps not generally realised, to reduce materially the influence of personal profit as a leading motive.

It is quite untrue to say that industry has followed a general policy of restricting production in order to enhance profits. The responsibility of those directing industry is to hold a just balance between the varying interests of the public as consumers, the staff and workmen as employees, and the stockholders as investors, and to make the highest possible contribution to the well-being of the nation as a whole. We believe these principles are today widely recognised and should be universally accepted. Continuous improvements in the spirit and organisation of industry were in progress before the war. One of our tasks is to improve upon these improvements and to remove any shortcomings there were in industry's approach to the handling of those questions, industrial, economic, and social, with which it is concerned. But the matter does not end there. We are faced now, still more shall we be faced after the war, with a whole range of new and formidable problems. Great changes therefore will have to be made in industry as elsewhere. It is our conviction that in industry the changes which are to be made, if they are to effect genuine and permanent improvement, must be evolutionary and practical rather than revolutionary and abstract. They must spring from past experience and be based on a true analysis of fact.

We emphasise that, above all, such changes must be such as will help industry and its several units to reach, and maintain, the highest possible degree of efficiency in every branch of its activity—in the discovery and development of new products and processes, and in every sphere of organisation, management, and workmanship.

We wish to see generally accepted, as a first charge upon industry, a code of obligations towards employees, and later in this section we shall make specific suggestions to that end. It is only necessary here to repeat that, if industry is to meet all its responsibilities—to the nation, to the consumer, to the stockholder, and to the employee—it can do so only by hard work and efficient performance.

In our belief, it is a necessary condition of achieving such efficiency that the system of private enterprise should continue. The achievements of British Industry have been due, in large measure, to that system. We do not think that the profit motive should be eliminated from our industrial and trading system. It is a deeply engrained characteristic, is certainly not the least of

Digitized by Google

the many incentives to good work and enterprise, and is common to all who derive their living from industry whatever position they may occupy in the industrial sphere. Any industrial system which left it altogether out of account would lose a vital part of its driving force. The motives of service and of profit are not mutually exclusive.

We pass now to the consideration of certain other factors which we consider to be essential to the full and healthy development of industry. They emerge from the conception, which we have just outlined, of a highly efficient industrial system organised upon a basis of private enterprise, and they are essential to its fulfillment.

Whatever form or structure any particular unit may take, management should be highly trained, skilled, and experienced; for success in industrial enterprise depends largely upon these factors and upon the individual manager being both willing and qualified to take responsibility. In our view the general standard of management in Great Britain can be still further improved, and every possible step must be taken to achieve that end.

For a period after the war the regulation of many types of imports and exports will be a matter for Government control, and measures such as the licensing system should continue for some time to regulate the movement of goods and the balance of payments. It will be necessary for the export interests of British Industry to secure more organisation and initiative within themselves as well as more effective governmental support. The cost of an efficient and permanent export service is considerable and to many independent firms prohibitive. Indeed, in the pre-war era the individual firm was constantly at a disadvantage in competing with other countries whose industries were organised for export and frequently had behind them also the active support of their governments. The wartime experience of export groups has underlined the importance of collaboration. At the same time, we cannot conceal our opinion that in this field industry generally has not in the past appreciated how high a degree of initiative is required under modern conditions. Despite many outstanding examples to the contrary, there was often insufficient attention paid to the individual requirements of overseas markets or to the importance of a personal knowledge of customers acquired on the spot.

The days are long past when British Industry could sell its products abroad easily by reason of its initial lead in industrial development. Other countries are now highly industrialised, and that process will have been inteusified by the war. We have no reason to complain of this development, but it is obviously a matter of the highest national importance that this country should earn its fair share of world trade in manufactures. We look forward to an orderly and co-operative plan between nations for dealing with questions of international trade.

Industry must recognize its social obligations in contributing to the work of physical reconstruction which will be necessary after the war. As an example, the siting of works and factories is a matter of public as well as private concern. There can be no return to the haphazard development of earlier days, involving as it did the disfigurement of the countryside, and industrial housing conditions which were no credit to the age. New industrial developments must conform to the requirements of any general regulations which Parliament, on behalf of the community as a whole, may lay down in order to preserve amenities, ensure the best use of the special qualities of particular pieces of land, prevent congestion, facilitate through traffic, and establish a proper balance between industrial and other areas. Industry is entitled to ask that the Government should not bring forward regulations of this character without having regard to the effects which they may have on costs and prices. Subject to that, industry itself should recognise the duty of going beyond the bare requirements of authority and doing all in its power to safeguard the social amenities of the country.

It is vitally important that the financial strength of industry should be conserved. We have already indicated the importance which we attach to the retention of the profit motive, but we would point out that the profit element cannot be measured solely from the angle of the dividends which are distributed. A clear distinction must be drawn between gross profits, part of which industry must retain for the maintenance and development of its own efficiency, and distributable profits which (limited by personal income tax and surtax) are received by the shareholders as income. Before the dividend stage is reached, industry must be allowed to retain and place to reserve adequate profits to provide for expansion and improvement. By the creation of sufficient reserves and the utilisation of these reserves in the business new capital is provided, research and development are financed, stability is maintained, and fluctuations of trade are

Digitized by Google

provided against, giving some assurance of continued employment and prosperity for staffs and workpeople.

In this connection the importance of ensuring that there is adequate disclosure and publication of the financial results of industry, both through the accounts of joint-stock companies, statutory corporations, etc., and through classified statistics collected by the Government, must be stressed. Such disclosure and publication will not only centre public attention on the relevance of these distinctions; they will also serve to create confidence in the financial management of industry and will dissipate any suggestion that "hidden profits" are being accumulated by industrial concerns to the detriment of the consumer and those who work for industry.

We have already stated that, in our view, industry should accept a code of obligations toward employees. We now proceed to set out more specifically and in some detail our approach to the practical problems which those obligations entail.

THE SOCIAL OBLIGATIONS OF INDUSTRY WITH SPECIAL REFERENCE TO LABOUR AND THE SOCIAL SERVICES

(1) *Trade unions.*—In the nineteenth century many employers resisted the claims of trade unions to recognition and only reluctantly accepted the principle of collective bargaining. But even at that time British employers were a generation in advance of employers in other countries, and for many years now trade-union recognition and collective bargaining have been the normal practice of managements in British industry.

We desire to see the authority of the trade unions strengthened within their own ranks and increasingly close collaboration achieved between them and management, so that they may, with a full sense of their joint responsibility to the public, examine problems affecting industry in relation to the community as a whole. Unless full and effective collaboration is achieved, the benefits which are owed to the consumers and the workpeople will be dissipated in disputes and friction. Just as in section III of this statement we outline further measures for the organisation of industry, so we should like to see the trade unions themselves take steps in the way of developing further arrangements between and within the various unions.

(2) *Works councils.*—We consider that labour in all its grades and sections should be brought into closer contact and association with the management. This aim can be assisted by the general adoption and extension of works councils and production committees already operating successfully in certain industries. The functions of these councils and committees would be advisory and consultative; they should in no way displace the trade unions as the negotiating bodies on questions of wages and conditions affecting the whole trade. Nor can they relieve the management of the responsibility for the conduct of a company's business and for taking all necessary decisions.

(3) *Duties to employees.*—Although we realise the impossibility of forecasting the conditions which will prevail at the end of the war, we are, nevertheless, encouraged to put forward the following aims as our suggestions for a code of duty toward employees. We would wish the provisions embodied in these suggestions to be a first charge on industry, to the extent to which they are matters for industry and not for the Government to carry out.

(*a*) *Opportunity.*—Every man and woman entering industry should be afforded the fullest possible opportunity of rising to positions of greater responsibilities, in any sphere commensurate with the capacity and energy which they show.

(*b*) *A minimum basic wage.*—Industry itself should aim at assuring to every able-bodied citizen engaged in industry and prepared to do an honest week's work such a basic level of wage as would afford a decent standard of life. Every opportunity should be given to supplement this minimum basic wage by the development of payment by results, and also by arrangements designed where practicable to enable the employees to share in the prosperity of their firms.

(*c*) *Unemployment.*—Short-period unemployment can never be wholly eliminated. There must, therefore, be provision for unemployment pay at subsistence rates and it must be clearly recognised that a man out of work through no fault of his own is entitled to a subsistence allowance as of right and not of charity. This must be coupled with an obligation to accept alternative employment elsewhere under suitable safeguards.

Government and local authority schemes of work which will have real national value can and must be prepared to relieve unemployment in periods of

Digitized by Google

trade set-backs. These schemes would be confined to public work, i. e., new roads, water supplies, housing, and the like. The equipment of industry with up-to-date plant and machinery, however, is as much in the national interest as public works, and industry will be entitled to obtain financial assistance for industrial schemes if our view is accepted that service to the community must be its first aim.

For alleviating unemployment the state might be called upon to take, on suitable terms as to interest and repayment, a share of what would be an uneconomic risk for private industry; or at any rate render available adequate credit, which is normally liable to be much restricted in these times. The forms of such assistance and the safeguards under which it should be given may vary from one industry to another, and it should be granted, in our opinion, only after consultation with the representative associations of industry which we hope to see enlarged on the lines sketched out in section IV of this memorandum.

(*d*) *National health insurance.*—Sickness and disability allowances should be such as to free the recipient from want when incapacitated from these causes.

(*e*) *Holidays with pay.*—Holidays with pay should be established throughout industry.

(*f*) *Hours of work.*—Reasonable hours of work should be agreed for all industrial workers according to the nature of their work and other relevant circumstances. Recent industrial experience has demonstrated that in many industries reduction of long working hours results in increasing the output of the individual worker.

(*g*) *Family allowances.*—We are in favour of a scheme of family allowances for children up to the school-leaving age. We have not attempted an examination of the various forms of family allowances, regarding this as outside our purview. We are of the opinion, however, that allowances should be at the same rate whether the parents are employed or unemployed; and that they should be paid through a state scheme, to obviate risk of men with families being prejudiced in obtaining employment.

(*h*) *Old-age pensions.*—Many industrial firms have, of their own accord, established pension schemes for their employees. This principle should be widely extended, so that contributory pension schemes operated by individual firms may serve if necessary to supplement State old-age pensions and thus enable everyone who has given long and good service to secure an adequate income on which to live when his working days are over.

(*j*) *Housing.*—An adequate standard of housing for all sections of the community is an essential element in social well-being. Normally it is our opinion that the housing of industrial workers falls into the category of "public works"; it may, however, frequently happen that there is no adequate housing accommodation adjoining an industrial site and that it is not being provided by a local authority or by private enterprise. We regard it as the ultimate duty of industry to ensure that its own employees are properly housed on reasonable terms.

(*k*) *Education* (*a*) *General.*—We have left to the end what is probably on a long view a vital subject, both for the nation as a whole and for industry, as an important element in the national economy—the subject of education. Many and difficult issues are involved in questions of educational reform, and we are not qualified to do more than indicate our general attitude towards them. We are in favour of the school-leaving age being raised to 16, though we realise that there may be practical difficulties in an immediate increase of the school population to the extent required by such a change.

We are also in favour of part-time compulsory education up to the age of 18. If arrangements are made for a reform of this character we consider that industry should make its contribution by suitably regulating the hours of work of juvenile employees.

We would emphasise that these advances will be ineffective, however, unless accompanied by a thorough overhaul of the whole educational system of the country and of the methods of training youth, with the two main objects of (1) giving equal opportunity to all, regardless of circumstances, who are prepared to take advantage of it, and (2) bringing the youth of the country to a full understanding and acceptance of the personal and national duties and responsibilities which, by heritage, are the right and obligation of every British subject.

(*b*) *Vocational.*—We consider that industry should give much more thought to schemes for industrial and vocational education, training, and promotion so that every employee with the requisite capacity may be able to fit himself for higher responsibilities. Implicit in any such schemes is the counterpart that

Digitized by Google

employees must share in a sense of their own responsibility, not only to their companies but to the community at large.

II. THE EXISTING STRUCTURES OF INDUSTRY

We have now stated both generally and, so far as is possible, specifically, the main principles which, in our view, should govern industrial activity in the fulfillment of its responsibilities. Before we pass to the measures required of industry in its internal organization to achieve these ends, it is necessary to review briefly the various forms in which it can at present operate and to discuss their appropriateness to the general conception which we have outlined.

We have already stated our belief in the system of private enterprise; it follows that, in our view, state ownership and operation is a system which would not succeed if applied generally. In this country it does not exist today in any sphere of productive industry. The post office may be quoted as an example of state ownership and efficient state operation. It is not however a manufacturing or trading business, but a statutory monopoly conducted on nontrading lines. The Royal Dockyards and the Royal Ordnance Factories may also be quoted, but they also are nontrading organisations and enjoy the advantages, if they do not have the complete form, of state monopolies. State ownership implies management by the civil service, which was not designed, and is not trained, to give the type of service required for the management of industry in general. By tradition, experience, and training it is designed for a wholly different administrative purpose.

These views have been reinforced by experience during the present emergency. Government control is necessary and possible in wartime, when the resources of the country are concentrated on a single objective, but we unhesitatingly take the view that its extension into times of peace, when industry has to meet an immense variety of continually changing needs, would be wasteful, clumsy, and destructive of development and initiative. The management of industry needs imagination, initiative, and an urge to lead in technical development. It also calls for a willingness to accept responsibility and risk, the ability to give quick decisions and the incentive to eliminate waste and achieve low costs of production. State ownership with civil-service control cannot be adapted to bring out these qualities. Moreover, there could be no effective appeal against inefficiency; on the contrary there would be the danger of industry becoming the plaything of party politics. For these reasons our belief is that any great extension of state ownership and operation to industry would so injure efficiency as to be a national calamity.

Statutory corporations.

State ownership must not be confused with corporations acting under a statutory charter or act of parliament, as do the Central Electricity Board, the London Passenger Transport Board, any many local undertakings. These undertakings perform services in which monopoly can be justified in the general interests of the community. In order to assist them to discharge their duties without embarrassment they are protected from competition and financial risk, in return for which security their stockholders accept a limited return on their capital. Their disadvantage, from the point of view of the public interest, lies not so much in the absence of competing enterprises in the same field, as in the power of these corporations to adjust their charges at the expense of the consumer to an extent necessary to render them self-supporting. It may be there is a direction in which this principle, suitably safeguarded against political interference, can be extended with advantage, but to apply it to industry in general would be a retrograde step which could not in the long run prove advantageous to the public.

Individual ownership and operation.

There are sections of industry which may best be conducted through the medium of small businesses. The advantages of personal direction and management are great. It is a method particularly suited to the national character. But, just as traffic is facilitated by the rule of the road, so we believe that national enterprise as a whole is aided if individualism is suitably regulated. It is essential that businesses owned and operated by individuals should continue to exist as an integral part of industry. Equally they should conform to the standards demanded by the social conscience of the times. They must be neither handicapped nor favoured in competition with other forms of industry, and they should have a voice in all industrial matters which may affect their interests.

Digitized by Google

Cooperative ownership and operation.

The cooperative movement owns substantial manufacturing capacity, which forms a distinctive section of industry. Unlike any other branch of industry, it is linked to, and controlled by, the cooperative system of retail distribution. Its importance and growth are of course related to the volume of trade which the retail societies obtain. Except for its link up with the retail societies and the special method of retail sales effected by those societies, the problems of the cooperative movement, so far as it is engaged in manufacturing operations, do not differ essentially from those facing other manufacturing enterprises, whether carried on under individual ownership or by large companies or combines. Accordingly, the cooperative movement must be expected to conform to any arrangements which are applicable to all forms of manufacturing industry, and as a corollary it should have a voice in all industrial matters.

Large companies and combines.

To produce certain types of commodities economically, large units are a necessity. In such cases, concentration of the available demand into these units is imperative if cheap production is to be obtained, not only for the benefit of the consumer in this country, but to enable our export trade to be maintained and developed in the face of competition from like units in other countries.

Industrial amalgamations are sometimes charged with abusing the strength of their position by retarding enterprise and invention, restricting production and either maintaining or raising prices unduly where price reductions are justified, thus exploiting the consumer instead of using their special efficiency to serve him. We do not deny that this is theoretically possible, but it would, however, be checked by public opinion and in addition would seldom pay, for in these industries cheap production and profitable working depend on large output. Properly administered amalgamations, commanding the services of technical, commercial, and financial experts and consultants provide in our view a more effective spur to efficiency than unchecked competition, which leads often to uneconomic investment and production and the final closing down of businesses through unprofitable trading, with all that this involves in displacement of labour. In general, industrial amalgamations have not taken unfair advantage of their position. When based on sound lines and well managed, they have been of great benefit to the consumer by using their larger financial resources to pursue an active research and development policy, thus enlarging business both at home and abroad. They have been able, by reason of their financial resources and technical efficiency, to put on the market a wide range of products in a way which could not have been done by small units, and at the same time to improve standards of wages and conditions of service and to facilitate the introduction of pensions and other schemes for the benefit of their workpeople.

Trade associatians and international cartels.

Trade associations play an important part in introducing a spirit of cooperation between those engaged in the same field, regulating conditions of trade, and eradicating unfair trade practices. They vary so much in their constitutions and functions that any wide generalisations on the subject have little validity. It cannot, however, be denied that trade associations can be operated merely for price maintenance, incidentally affording protection to the inefficient or high-cost producer, rather than for the general good. Such a policy must be unreservedly condemned as running counter to the prime duty of industry, which is to serve the consuming public, and must not be allowed to find a place in future industrial organisation. It should always be the aim of industry to maintain production and consumption at the highest possible level.

Cartels differ from trade associations in that they are international in scope. Where similar products are manufactured in different countries, these international agreements (which necessarily imply that the parties to them are able to speak for the major share of the industry concerned) are essential to keep production equitably allocated between countries and companies, in tune with the maximum world demand attainable. They exercise a stabilising influence against violent fluctuations and dislocating shifts of the currents of trade, and thus have an essential part to play in post-war reconstruction, when international economic cooperation for the general benefit will be of the highest importance.

III. THE CLOSER ORGANISATION OF INDUSTRY

We have previously defined the fundamental aim set before us in terms of a threefold responsibility to the consumer, to the employees, and to the stock-

Digitized by Google

holders. Within this triple responsibility we desire to stress the primary duty of industry towards the consumer. We therefore restate our aim as being to assure to the consumer the full benefit of constant technical progress reflected in higher quality or lower prices, or both, while at the same time establishing greater economic security for all than heretofore—security from violent fluctuations in employment, in the returns to industry, in the currents of domestic and international trade. So far as these fluctuations arise as an incident in technical advance and a rising level of efficiency, the gains they bring outweigh the cost, provided that wage earners are protected by an adequate system of unemployment insurance, and industry is allowed to prepare for them by accumulating reserves out of profits. But the insecurity is not all of this kind. Much arises from the uncoordinated action of competing firms; much from the lack of a wholly effective machinery for formulating and putting at the disposal of government a coherent and concerted picture of the experience and opinion of industry; much finally from fluctuations in domestic and international trade, which, however, are mainly beyond the control of industry itself.

It appears to us therefore to be an essential condition of progress that the relations between firms, between different industries, and between industry as a whole and government should be more fully and comprehensively organised in some form of permanent association. Otherwise there will continue to be loss and friction through forms of competition which are wasteful and uneconomic; the experience and knowledge of industry as a whole will not be mobilised as an effective opinion in questions domestic or international in which it is deeply and inevitably concerned; and it will be impossible to achieve the effective general application of the code which we believe to be essential.

In what follows we sketch out the sort of organisation which we have in mind, emphasising, however, that it is no more than a sketch and might well be modified, and substantially modified, as a result of closer and more detailed examination by the committee whose appointment we propose in the final section of this statement.

(1) The first step should be the classification of industries into sections, as has already been done in many branches of industry. The classification adopted should not be regarded as fixed and immutable, but should allow of elasticity, so that novel manufactures can be brought into new classifications or merged into existing ones.

(2) Each section should set up a sectional association which, operating where necessary through local or subassociations, would be charged with the duties of coordinating the activities and securing the collaboration of all producers in its own section.

(3) Sectional associations might in some instances be formed by adapting existing organizations, e. g., trade associations and industrial and export groups, where these existed on suitable lines. In other cases completely new sectional associations would have to be established. There would have to be a measure of uniformity in their constitutions, and these would have to provide for a proper system completely fair to all members, by which firms in any sectional association at fixed intervals elected their councils. Special arrangements to ensure the adequate representation of small firms would be necessary in the case of sectional associations, which might otherwise be dominated by the controlling position of one or more producers in their section.

(4) Sectional associations would be under the general direction of their councils, and would be assisted in the performance of their duties by a trained managerial and intelligence staff. The extent of the authority of these councils and the degree to which they would seek to exercise it are matters for further examination. It is clear to us, however, that what suited one section might not suit another. We do not, therefore, advocate anything approaching standardization in the operation of the councils or their sectional associations. What we desire is that each section, through its sectional association, should be able to organize itself with the following main purposes in view:

(*a*) To promote the production of a maximum output at the lowest possible price consistent with the adequate remuneration of labor and capital.

(*b*) To establish a greater measure of collaboration, both within the trade and with other sections of industry, in the interests of efficiency and therefore of service to the consumer.

(*c*) To encourage such forms of industrial competition as are conducive to the public interest; conversely to discourage wasteful and destructive competition.

(*d*) To establish contact with any bodies representative of the consuming public or sections of it and to take account of any representations which may

Digitized by Google

be made in regard to the quality or price of manufactured products or their methods of distribution.

(*e*) To adopt standards of wages and conditions of service which pay full regard, so far as lies within their power, to industry's aims as indicated in section I.

(5) We contemplate also that there be brought into being a Central Council of Industry, representative of the whole of industry. Such a council is needed to formulate the views of industry on questions transcending the limits of any one trade, especially questions on which different sections may take different views. In the transitional period from war to peace there will be particular need for the advice of such a body, and we would desire to see all the existing national associations and federations which represent industry brought into consultation together as early as possible on the right means of forming it.

(6) The Central Council of Industry should, when the plan is finally worked out, be a body elected at fixed intervals by the councils of the associations. We conceive that its functions would be:

(*a*) To maintain regular contact with the sectional associations.

(*b*) To maintain contact with the Trades Union Congress, especially so as to find means of giving greater expression to the high standards of mutual responsibility which industry and those employed in it owe to one another.

(*c*) To act on behalf of British industry in furthering international economic cooperation and the expansion of world trade.

(*d*) To give consideration, from the standpoint of industry as a whole, to other matters of high economic policy.

(*e*) To establish an intelligence service of the highest quality and to be the channel through which the views of industry on economic, financial, and social problems, and on world trade generally, can be communicated to the Government.

(*f*) To recommend to the Government changes which seem necessary in existing industrial and social legislation, and to act generally as the medium for making proposals to the Government on matters which from the standpoint of industry appear to require executive action.

It will be observed that the Central Council of Industry, among its other functions, would act on behalf of British industry in furthering international economic cooperation and the expansion of world trade. This connotes that while our primary duty is to put our own house in order, we do not disregard the problems ahead of the country in its future relations with the Empire, United States, Russia, China, and other Allied Powers. These relations will have far-reaching consequences in which Great Britain is vitally interested. We consider that this Central Council would provide a medium for the representation of industry as a whole, as it would be in contact with the greatest proportion of production in this country.

(7) This Central Council of Industry will require considerable organisation. It will need to work through subcommittees, and, if it is to function successfully as the body representative of British industry, will require a trained managerial, intelligence, and secretarial staff qualified to act as the general staff of industry.

These several organisations (with the assistance of their trained and experienced staff) would afford to the various trades and units which make up the whole the opportunity of pooling knowledge, of joint consideration of important common problems, and of the systematic formulation and presentation of a policy on such problems.

But such a plan would have a limited usefulness only if a considerable number of firms did not join the sectional associations, or, having joined, accepted such privileges as might accrue from membership while declining to accept any corresponding duty to accept majority views. It particular, it would be impossible in such circumstances to be sure of avoiding the waste involved in uneconomic competition, and impossible to be sure of securing a general application of the code which we have recommended in relation especially to labour and the social services.

It is necessary for this reason to consider whether, and if so to what extent, the associations and the councils should be given specific powers (of course within prescribed limits) to make regulations and to enforce decisions, and whether membership of associations should be made compulsory.

This is a subject of far-reaching implication and one upon which specific proposals must not be lightly made. We propose that the whole question of the further organisation of industry should be remitted for close study to the committee whose appointment we recommend. We must, however, add here that if as a result of that study the committee should find it necessary to make recommendations which involved the granting of compulsory powers to associations and councils, such powers would need to be subject to proper safeguards.

Digitized by Google

In the first place, the granting of such powers, their form and scope, and their continuance, would, of course, be a matter for the determination of Parliament. We do not for a moment contemplate any final devolution upon the representative bodies of industry of legislative powers which properly belong only to Parliament. Inasmuch as rule-making authority might be delegated to any such bodies, it would in our view be right that such rules should not become operative without Parliamentary authority.

It is a cardinal point in our proposals that ample provision should be made for the protection of the public as consumer.

We are fully alive to the fact that any proposals for the reorganisation of productive industry, especially if they visualize the possibility of it being granted compulsory powers, would, in the absence of such an assurance, be open to the criticism that it was an attempt on industry's part to assume dictatorial powers. A study of this document should make it clear that nothing is further from our intentions.

We consider it would also be necessary to provide means by which any individual firm could appeal against decisions of sectional associations or the Central Council of Industry, or against regulations which those bodies proposed to make. We have in mind particularly the special needs and interests of small producers, which without some special provision for appeal might well appear to run the risk of being swamped by the interests of larger and more powerful undertakings.

It appears to us that such needs might be suitably met by the setting up of an Industrial Tribunal or Commission. This would be in the nature of a final court of appeal on all industrial matters and would be appointed, not by industry itself but by the Government. The powers and duties of such a tribunal, which would be generally in the nature of an impartial judicial body, would again be a matter for final determination by Parliament. We need only say that for our part we regard the general function of such a body as being to ensure that the organisations of productive industry should function properly and that any powers accorded to them should be impartially exercised so as to afford full protection to the consumer and to the small producer as contrasted with the larger producer. We recognise that many difficult questions will be met within the creation of such a tribunal. If we do not deal with them here at length, it is because they are questions which require detailed study and are finally for Parliament rather than for industry to pronounce upon.

IV. APPOINTMENT OF A COMMITTEE TO FORMULATE DETAILED PROPOSALS

(1) Whoever attempts now to discuss post-war problems is in danger of falling between two stools. If he is specific in his approach it may well be urged that he is legislating for conditions which are largely unknown; if he is general it may be said that his contribution is platitudinous and therefore valueless. The difficulty is inescapable and must be accepted. The one fatal thing would be to do, and to think, nothing.

In this memorandum we have tried to find a reasonable middle way. We do not claim to have put forward a solution of all the problems with which industry and the community are jointly faced, and we would stress that the proposals sketched in this interim statement need to be examined, developed, and elaborated. We maintain, however, that if industry could be fully organised on the lines we have indicated, it should be possible not only to achieve greater economic security and a higher standard of life for the whole people of this land, but to ensure that all who engage in industry are made aware of their clear responsibility for conducting industry in accordance with the needs of the community—in other words, in accord with a national conscience.

(2) Having issued this statement we should fail in our duty if we did not take immediate steps to see that our suggestions are more fully examined and developed. With this object it is proposed to appoint a committee to examine the suggestions in detail and to submit a report. This report will specify the forms of organisation that need to be developed if our general aims are to be carried into practice, the functions which should be allotted to such organisations, and the general framework within which they should operate. The committee will be instructed to confer with the existing national industrial organisations, in order that it shall not lack the benefit of their wide experience and shall be assisted in arriving at conclusions which shall be thoroughly representative of industry. It is hoped that these bodies will give their active assistance.

(3) In publishing this statement now, we are actuated by a double purpose. We wish first that the public shall see the steps which the signatories propose, or-

Digitized by Google

recommend shall be taken, to improve industry's effectiveness for giving service to the community. Secondly, we shall welcome any views or opinions on the report which members of the public or other bodies, including representatives of labour and of the cooperative movement, may think fit to offer.

(4) Finally, we well understand that some of our suggestions are controversial and that we cannot expect to find general acceptance of what we have said. In particular the form of industrial organisation we have suggested, and our reference to the possibility of investing those organisations with a limited degree of compulsory powers might, if considered out of the general context, give rise to apprehensions that we had in mind the establishment of an industrial system controlled by large and monopolistic corporations, enjoying a considerable measure of self-government, and capable therefore of exploiting the consumer, labour, and the small producer. This is not so. It is precisely because our intentions are wholly different that we have in this document laid emphasis on four principles: (1) That the primary duty of industry is to the consumer; (2) that industry should acknowledge, by accepting a code of performance towards the workers, the partnership of labour in industry; (3) that in any sectional or central organisation of industry special steps should be taken to safeguard the interests of small producers; and (4) that whatever form the further organisation of industry might take the matter would be, and would remain, one for the determination of Parliament. We have no desire to see any radical change in the constitutional relationship between industry on the one hand and the Government and Parliament upon the other.

A. R. SMITH, *Secretary*,

EXHIBIT NO. 6

STATEMENT OF HON. THURMAN ARNOLD, ASSISTANT ATTORNEY GENERAL OF THE UNITED STATES, BEFORE THE SENATE COMMITTEE ON PATENTS, JULY 31, 1942

I appear before this committee to present a bill to correct those pressing patent abuses which have so disastrously affected our war effort. Through these abuses a vital segment of American economy has been strait jacketed into a foreign cartel system, and the free flow of strategic materials vital for war and for internal security has been impeded and delayed.

Digitized by Google

This committee has a peculiar responsibility—it has investigated the patent system at a time when it was never more important that we have full and unhampered production and that American business be entirely free of either old or prospective commitments to cartels. Today, largely through the work of this committee, we have learned that the production and distribution of vital elements such as magnesium, zinc, rubber, aviation gasoline, beryllium, titanium, electrical equipment, plastics, dyestuffs, tungsten carbide, and a variety of other products necessary for our war effort as well as our industrial well-being have been seriously impeded and delayed and in some cases totally blocked by patent restrictions.

From the evidence taken before this committee two evils stand out with startling clarity, demanding an immediate remedy. First, we must act to prevent patents from being used to destroy independent business and exploit the consumer at home. Second, we must act to prevent secret patent cartels from controlling our foreign economic policy abroad.

It is too clear to require an argument that international and domestic cartels have victimized American business on an increasing scale for the past 20 years. To these cartels we owe our failure to develop light metals, chemicals, and plastics before the war. To them we owe our present shortages of many essential war materials. These cartels have victimized big business as well as little business by holding back new technologies until they were in a position to control them and prevent them from threatening their domination of the market. It has taken the intense effort of the war to jar these cartels out of their entrenched antiproductive positions.

In the field of foreign economic policy international cartels have erected secret protective tariffs, divided foreign markets, and aided our enemies, not intentionally but because of their willingness to make any sort of alliance to avoid competition and to dominate or secure the domination of the market. Germany was able to take advantage of this cartel system because of its regimented control of all industry. It deliberately used cartel power to further German economic penetration, and to disarm the democracies. Hitler made it a criminal offense to give either inventions or information as to inventions to foreign powers without submission to a Government agency. Hence we got only what Hitler decided he wanted us to get. We gave whatever was necessary to further the selfish interests of private groups.

There are two problems before this committee—one, the problem of patent reform, a technical problem involving endless debate; the other is the immediate problem of curbing restrictions on production by those who use the patent privilege as an instrument of business policy rather than for its constitutional purpose—to promote the progress of science and the useful arts.

I am not here addressing myself to the problem of overhauling the patent law itself. Of course it should be studied. As long as we have a patent system it will require reforms from time to time. But I am concerned here only with the immediate problem of preventing any patent law, reformed or unreformed, from slowing down the production of our Nation or turning over the control of either domestic or foreign commerce to any powerful private minority.

The remedy for this evil is not technical. It can be simple in design following the established principles by which we have always protected free enterprise in this country. It can be made as clear to the layman as to the technical lawyer. And the solution of that problem must not wait, because we need it now. It consists simply in preventing the use of patents as an instrument to suppress competition, restrict production, or destroy independent business on a scale that substantially interferes with the distribution of any commodity. Every other privilege given to industry or to agriculture is curbed by the enforcement of this remedy today. There is no reason in common sense or theory why the patent privilege should remain, in definance of the Constitution, a protected game preserve for the predatory animals of monopoly power.

My proposal is to curb the illegitimate use of the patent privilege. Therefore, I will give a brief description of what most people would agree are proper uses of a patent. Under that constitutional privilege I think that the limited monopoly of a patent can be legitimately used in the following situations: The first is where the attempt is to obtain the maximum royalties for the inventor by widespread licensing. The second is where licenses are refused in order to give a struggling infant enterprise a chance to get on its feet and compete with powerful units already established in the industry.

But where licenses are refused or restricted in order to give a dominating industry a chance to hold down production or to give a patent holder a power

Digitized by Google

substantially to control the market for any commodity, the Constitution provides no justification. Patents were never intended to be the keystones to support industrial empires. When we permit it to be so used we delegate power over Congress to a powerful minority without public responsibility, in defiance of the Constitution.

The remedy is simple. We do not need to reform the patent law. All we need to do is to define the abuse of patents I have just described and penalize it.

The bill I propose therefore strikes only at those patents which have been so abused as to limit unreasonably the supply of any article in interstate commerce. Patents which are found by the courts to have been so misused will be canceled.

Briefly, the bill provides as follows: First, no infringement action can proceed without having a copy of the pleadings served upon the Attorney General who has the right to intervene. Second, any use of a patent, including any unreasonable failure or refusal to grant licenses thereunder, which has the effect of unreasonably limiting the supply of any article moving in interstate commerce is declared to be illegal, and a judgment or conviction that a patent has been so used renders the patent null and void. Third, the criminal penalty for such misuse of a patent is made inapplicable where prior full disclosure has been made to the Attorney General. Fourth, all patent assignments and licenses must be in writing with a copy filed with the Attorney General.

I will proceed to explain the effect of these provisions. I start with section 3 because it is the most important. It adds a new paragraph to section 1 of the Sherman Act. It makes illegal the use of any patent which has the effect of unreasonably limiting the supply of any article in interstate commerce. It permits the Attorney General with appropriate safeguards to cancel a patent which has been so used.

The effect of section 3 is to subject the patent privilege to the same penalties and hazards which now curb the use of every other privilege of combination or limited monopoly. Take, as an analogy, the relationship of the Sherman Act to the law of incorporation. The corporation franchise is even more important to efficient organization of industry than the patent. It permits corporations to be formed, to merge, to have subsidiaries, to make agreements not ultra vires. Yet when a private group takes advantage of the numerous opportunities offered by our laws of incorporation to dominate the market, the corporation will be dissolved under the Sherman Act.

The Sherman Act, in determining whether or not a corporation or combination of corporations will be dissolved does not concern itself with the method, but with the economic result. Where an economic result has been obtained which unreasonably restrains commerce the corporations will be dissolved, even though the use of that device would have been proper on a small scale and for different purposes.

There is no reason, either in logic or in equity, why patent privileges should stand on a different footing. Actually the patent privilege happens to be only one of a long list of privileges which have been abused in the interest of monopoly power and restricted production. When the act was passed the most common device for this purpose was the common-law trust, and thus the antitrust law got its name which has stuck long after this device was abandoned. The long years since 1890 have produced numerous other Trojan horses to conceal organized oppression of independent enterprise. Each has been legal on its face. Thus, the trade association became an instrument of coercion; the innocent-looking publication of statistical data became a way of dividing the markets; even codes of business ethics have been used to restrict production and crush competition. All of these privileges can be taken away when their abuse is shown. Section 3 subjects the patent law to the same penalties.

There is imperative reason why this should be done today. No privilege has ever been subjected to such abuse by great corporate rackets as the patent privilege. There are three reasons why it made an excellent smoke screen for monopoly power. In the first place, it is surrounded with legal mystery making the real problem difficult to present to the laymen. In the second place, the sentimental regard which the public rightly has for struggling inventors gives the corporation which pretends it is a struggling inventor a certain public appeal. In the third place, through a perversion of the purpose of the patent law, the patent privilege has been considered as property, while no one thought of the right to form a trade association or a corporation as property. Thus a fanciful difference has grown up between the dissolution of the corporation and the cancelation of the patent. This difference is removed by the proposed bill.

84949—43—pt. 1——7

Digitized by Google

There is nothing wrong with the fundamental principle of our patent laws. The idea of protecting inventors and those who invest in invention furthers a just purpose designed by the Constitution "to promote the progress of science and the useful arts." The Constitution goes on to say how that purpose shall be accomplished, to wit, "by securing to authors and inventors the exclusive right to their writings and inventions for a limited time." The suggested bill is in no way a derogation of that fundamental principle.

The purpose of the bill is twofold: (1) To put a real penalty on the abuse of the patent privilege to violate the very purpose for which it was created; (2) to take away from an illegal combination the weapons which enabled them to build up and maintain that combination against independent enterprise.

This is not a new principle. The same curb is put on practically every other business privilege.

Safeguards against the cancelation of the patents in the hands of owners who act in good faith.—Section 3 denounces the use of any patent which has the effect of unreasonably limiting the supply of any article in interstate commerce. This is not a rule of thumb. Indeed the great virtue of the Sherman Act is the fact that the absence of the rule of thumb permits each industrial situation to be considered on its facts. In putting a curb on unreasonable restraints it assumes that every great corporation knows enough about its own industry to realize when it is skating on thin ice.

Nevertheless, since the line between reasonable and unreasonable control over the supply of a commodity is not sharp, the bill provides a safeguard for those who act in good faith. It enacts into law a prosecution policy already adopted by the Department of Justice, by providing that, if a full and complete statement of the facts of any patent policy is submitted to the Attorney General in advance, the penalties of the bill shall not apply. In such a case the Government is restricted to its right to enjoin.

In this way a patent holder is given the opportunity of finding out whether his patent policies are such as to create a risk of cancelation of the patents themselves. And, further, in the event of disagreement with the opinion of the Department of Justice he is given an opportunity to test his policy in a civil action which involves no hazard whatever.

This sort of procedure, as applied to the corporate franchise, is illustrated in the *Appalachian Coals case*. In that case a group of corporations formed a marketing association to get better prices and a more orderly market for its members. This was obviously a restraint of trade. The only question was whether that restraint was reasonable. The plan was submitted to the Government. It was condemned. Civil litigation followed.

In declaring that the marketing agency was a reasonable restraint of trade, Mr. Justice Hughes considered two factors: (1) The keen competition which existed in bituminous coal, (2) the very limited control over the supply of that commodity which the marketing agency had power to exercise. Because of these two factors he held that the combination was reasonable. Nevertheless he ordered that the case continue on the docket so that if, in the future, the power of the combination should grow and dominate the market, the Government would have the opportunity at some future time to dissolve it, without criminal penalty.

Let us apply the same principle to patents. Suppose you had a patent on a superior fountain pen. So long as there were plenty of other fountain pens on the market, so long as you were not in the position to artificially control fountain pens your patents would be in no danger under the proposed bill. When, however, either by a patent pool or by a single patent, you obtained substantial control over the market for fountain pens so that the power to restrain production and raise prices of that important consumers item, you would run the risk of patent cancelation. At the same time you would have the privilege of submitting your patent policy to the Department of Justice when you felt that you were running close to the line so that that policy might be given the test of performance offered by the *Appalachian Coals case*, without the risk of penalty or cancelation on the part of the patent owner.

If this submission were made in advance and it was determined that your domination of the commodity was unreasonable you would be compelled to issue such licenses on such terms so that domination would not continue. Only if you pursued an aggressive patent policy in secret, without submitting it to the Government would you be in danger of the penalties of the bill.

This method of penalizing the unreasonable use of patents provides a flexible principle which can take into account the difference between different industries.—The great advantage of the Sherman Act is that it allows us to proceed

Digitized by Google

on the case by case principle. It does not compel us to forecast a vast array of hypothetical cases and provide for them in advance. It does not compel us to treat dissimilar cases by the same rule. The steel industry is different from coal. Coal is different from drugs. No workable rule can be formulated to attempt to apply the same principle to both.

Unreasonableness of restraint depends upon the industrial situation, the structure of the industry, the potential danger to independent enterprise under existing conditions. All of these factors can be developed and decided by the case by case method under the Sherman Act. They can never be forecast by any set of definitions.

Indeed the essence of bureaucracy is the attempt to put industry in a strait jacket of hypothetical principles formulated in advance and applied with rigid logic and consistency. The essence of industrial democracy and economic freedom is the development of law, case by case, and in the light of the particular circumstances of each case. The proposed bill is an attempt to apply this case by case technique in common law to the unreasonable use of the patent privilege to restrain trade.

Let me give an illustration of the necessity of this case-by-case approach in determining the reason of any restraint of trade. The growth of chain stores has put independent retailers in a disadvantageous position because of the advertising power of these great combinations. To meet this disadvantage independent retailers often pool their funds in a cooperative advertising campaign, offering special sales at which named commodities are sold at a special price. Of course, the members of such a cooperative advertising effort determine the sale prices they advertise. Is this unreasonable restraint of trade? No possible rule can be made in the abstract. If the cooperative advertising effort is large enough to substantially dominate the market, it is bad. However, if it is necessary to enable independent retailers to compete, it may be reasonable. The size and power of the chains, the character of the advertising, the quantity of goods they sell in the particular locality, are the determining factors under the case by case approach of the *Appalachian Coals case.* If a mistake is made by the Antitrust Division in declining to prosecute in any locality, it can always be corrected by civil proceedings without penalty provided the advertising plan was submitted in advance, but no general rule of thumb can possibly be laid down.

I cite as example another case. Recently the Antitrust Division told two small steel corporations that if they merged no criminal prosecution would be instituted. It did not approve the merger. It simply gave it the test of performance in the *Appalachian Coals case,* taking into consideration the fact that the large steel companies now control 90 percent of the industry. It told the small concerns that in the event of a civil suit being started in the future not only their own combination but that of the larger steel companies would be part of those proceedings. If the mistake was made it can be corrected. In the meantime business is going on.

But no possible rule of thumb could be formulated which would apply both to the steel industry and to the cooperative advertising ventures.

The same principle applied to patents. We should consider tthe reasonableness of any patent policy according to the situation of the industry that adopts it.

So much for a general destruction of the purposes of the bill, which centers around section 3. I will now take up the various types of patent abuse disclosed by this committee and show how the bill gives an effective remedy for each one of them. In this discussion the reasons for the other sections of the bill will become apparent.

1. *The patent blitzkrieg.*—I take this name from the files of the companies under investigation. It is used to describe a campaign of infringement suits. A great patent cartel is able to employ an army of counsel. It can take advantage of the endless delays possible in any litigation. It can sue customers of weaker concerns and thus destroy this business. Whatever the theory may be, the fact is that any shaky patent in the hands of a dominant group is sufficient to coerce and intimidate an entire industry through the use of the patent blitzkrieg. Banks will not lend money while infringement suit backed by such force is threatened. Customers are scared away; business goes to pieces. The illustrations are countless. I choose only two. The first is found in the reports of the Temporary National Economic Committee.

Here was a case where a prosperous concern doing $800,000 worth of business found itself bankrupt because it declined to sell out to the Hartford Empire patent cartel at the price set by that aggressive monopoly. I quote from the testimony

Digitized by Google

of the treasurer of the Amsler Morton Co. in the middle of that battle:

"Q. Can you tell me how much the * * * (patent) litigation cost your company?

"A. Well, it was tremendous for a small concern.

"Q. How much was it?

"A. It amounted to close to $70,000 and that doesn't take into consideration the expense of our organization.

"Q. I would like to ask you this: You told us, I believe, that you have sold only one lehr so far this year?

"A. That is correct?

"Q. That you sold no lehrs last year. What would you say the value of the glass-manufacturing machinery business is now? That is, your business.

"A. I will give you a comparison. In 1928 we were doing $800,000 worth of business and last year we had $18,000 worth of business in the glass industry—quite a drop."

The files of the Temporary National Economic Committee reveal another case where an independent concern attempted to manufacture milk bottles. I quote from the testimony:

"Mr. COLEMAN. We naturally were finally forced to hire a patent attorney. We had to acquire the services of a Texas attorney, and I think there are some two or three patent attorneys in the State. They brought us into court in April of 1935, as I recall. Well, when I arrived in San Angelo and met them there in the hotel, I can conservatively say there was a half trainload of attorneys and equipment. There were motion-picture projectors and attorneys all over the place. I don't know anyone of the Hartford legal staff that was not there. They were prepared to give us a nice battle. Well, I had only one attorney and he was considerably lost in that crowd. I wish you might have seen his face that morning. So I promptly asked for a recess until the afternoon, in order to see if we couldn't settle the case out of court.

"Mr. Cox. Did you settle the case out of court?

"Mr. COLEMAN. We were able to settle the case out of court; yes, sir.

"Mr. Cox. What were the terms of the settlement?

"Mr. COLEMAN. We received $10,000 in cash and were allowed a 6 months' license on the milk bottles which we paid royalty on at that time for that 6 months' period. At the end of that period we were to ship these two feeders back to the Hartford-Empire Co."

The patent blitzkrieg is found in many industries, including radio, chemicals, metals, optical goods, and electrical goods.

The oppressive use of infrigement suits is the heart of cartel domination. It is the weapon by which shaky patents are made effective methods of control. The bill automatically puts anyone who brings an infringement suit under the immediate supervision of the Antitrust Division. It takes away none of his rights if the suit is well founded, but it subjects him to an immediate penalty if the court finds that the patent has been abused. The small businessman no longer has to fight an oppressive and unjustified suit alone. He is given the protection of the research and the personnel of the Department of Justice if his defense appears to be well founded.

2. *The "umbrella" patent.*—I use this term to describe a patent so broad that it really covers an industrial idea. The most famous "umbrella" patent was the old Selden patent which for a time blocked the development of the automobile industry. The Selden patent in effect covered the idea of an automobile. Under this patent automobile manufacturers formed a tight association to exclude outsiders. In one case the buyer of a car was sued under this patent for running his own automobile. Of course, under such tactics everyone was forced into the association or destroyed. Henry Ford was excluded and it was only his persistence and financial ability that enabled him to break the ring.

Such patents are a menace to productive industry. Unless they are curbed by Government intervention it is only in the case of a lucky accident that they do not grow to dominate the industry.

In the case of hard board one of these "umbrella" patents was used to destroy all the independent enterprise which existed and even to prevent new types of hard board from being manufactured. This patent was so broad that it included the idea of making hard board from any vegetable substance with fibers.

There may be a legitimate reason under the present confused state of the patent law for the issuance of such patents. If you do not today take out a patent on everything under the sun, some patent expert is liable to get one and sue for infringement. The testimony of Edsel Ford before the Temporary Na-

Digitized by Google

tional Economic Committee shows that Ford was compelled to take out patents in order to ward off litigation.

This bill permits umbrella patents to be used for such protective purposes. But if they are used as instruments of aggression not only the umbrella claims but even the control invention will run the risk of cancelation. And, further, the Government is given notice of the beginning of a patent blitzkreig so that it can stop it in time.

For example, in the *Masonite case*, the Government after long investigation unearthed the outrageous patent policies which were condemned by the Supreme Court. But this was "locking the door after the horse was gone." Domination of the industry had already been achieved. The Masonite patent is still in the hands of the aggressor to be used the next time the Department of Justice goes to sleep.

Giving notice of infringement suits would put a positive obligation on the Department of Justice. Failure to fulfill that obligation would require accounting and explanation. And, further, it would put such a hazard upon the commencement of one of these suits for purposes of monopoly domination that it is unlikely that many would be brought.

3. *The accordion patent.*—Long ago the Supreme Court of the United States made illegal the sale of a patent license conditioned upon the use of unpatented goods. To meet this emergency the patent bar devised what I call the accordion patent. A good example is found in the *Univis case*. In that case the invention, if any, consisted in the position of a lens segment in bifocal spectacles. However, this invention was not patented. Instead, the Univis company got a patent on the finished spectacles. They then claimed the right to control not only the invention but the unpatented techniques of grinding and polishing and fitting the frames on the customer's face.

The bill would rob the accordion patent of any value except the protective features of such claims to avoid the infringement suits of others.

4. *The Bottleneck patent.*—Occasionally, a man may invent some gadget necessary for the efficient operation of an entire industry. If he is lucky enough to create such an important invention he may make all the money he pleases provided he does not act as a dog in the manger in holding up the techniques of the industry.

An actual case of this sort is found in the hearing on the Dzus patent before this committee. It is a patent on a small screw, necessary to complete an airplane. The owner refused to license any competitor to make them. The supply got short. Airplanes were held up on assembly lines. Aviation companies were protesting. All Dzus would do was to give temporary licenses, not to competitors but to his customers, and these were to be revoked in the future the moment Dzus could supply the screws himself. Of course, no one could go into manufacture under those conditions and no one did, although one of the airplane companies attempted to make the screws by hand in order to avoid buying expensive machinery which Dzus would control in the future. Nevertheless, airplanes stood still on assembly lines while Dzus attempted not to get royalties on his patent but to maintain control by refusing to license. There were other patents but Dzus' position was strong enough actually to hold up assembly lines in the time of war.

In the *Ethyl case*, the industry was dominated by two bottleneck patents, one the right to mix ethyl fluid in gasoline, and the other, the right to burn it in cars.

This is the kind of thing that no sensible man ought to tolerate. Struggling inventors ought to get protection, but not domination of any commodity. When they find themselves in that position, they should either stop their dog-in-the-manger tactics or risk the cancelation of their patent for using it unreasonably in restraint of trade. And whether they are using it unreasonably should be a question of fact, in the light of all the circumstances and not of theory. Otherwise, a patent issued to promote the progress of science and the useful arts becomes a weapon to slow down production in order to establish future monopoly control.

5. *The patent pool.*—The patent system in the United States was conceived during a time when manufacturing was a relatively simple thing. Thus patents came to cover entire devices. As our technology became more complex, patents came to cover only parts of machines and instruments so that very often several individuals owned patents covering the various functions of an individual machine. This resulted in what has been called the patent impasse. The various parties could either buy each other out or form a patent pool.

Digitized by Google

While the patent pool was at first devised to break an impasse, it took on additional features, for one thing, the members of the pool generally decided to keep others out unless they would abide by the rules and regulations concerning prices, production, and division of markets. Anyone who attempted to operate independently faced the combined strength and resources of the pool in litigation. Further, the power of the patent pool is such that once it exists its power increases enormously. It snowballs into the further acquisition of everyone else's patent rights, and crushes anyone who stands in its way. I quote from the statement of the patent attorney of Standard Oil:

"All manufacturing patent licenses of licensees will help to build up licensors' dominating position, but no licensee will get the benefit of any other licensee's manufacturing patent rights. In other words, this is not a cross-licensing arrangement, but one in which the patents are piled on patents in the hands of one centralizing company."

Another device which exists in connection with the organization of patent pools is the patent settlement—often an attempt to hide the illegality of the arrangement under what appears to be bona fide litigation.

The size of these patent pools in recent times has become enormous. Thousands of patents are found in the Standard-I. G. patent pool; over 15,000 patents are in the General Electric, A. T. & T., and R. C. A. patent pool. In fact, it is from these huge resources of patent pools that the umbrella patent, the blitzkrieg patent, and the bottleneck patents find their most fertile soil.

When there is an underlying understanding, even the issuance of separate licenses may be merely another way to cement what is in effect a patent pool. Thus, the dealing out of patents to separate American businesses, who then license according to a prior understanding, is only different in form than the holding of all of these patents in one centralizing company.

At present the law relating to patent pool—and particularly the patent settlement—needs clarification. Pools are not illegal per se. Often they are necessary for protection of struggling industries against infringement suits. Combinations of patents may be required to complete a finished product. Litigation settlements in themselves are favored by the law.

The bill clarifies the difference between an illegal pool and a proper combination by imposing the test of market domination. It makes discovery of that domination inevitable by requiring notice of every infringement suit.

I believe that the patent pool problem will be solved by the hazards placed on unreasonable conduct by the proposed bill.

6. *Licenses which restrict use.*—The character of invention today is such that developments in one field have applications in another. Instead of utilizing inventions to the full, it has been to the interest of the variety of patent-owning groups to channel these developments by restricting the use to which the process may be put. Thus, in the organic chemical field, the process which makes butadiene an essential of synthetic rubber is also capable of making aviation gasoline. I. G. Farben, however, was able to narrow Standard Oil's rights to the process for the use only in gasoline. In the glass container industry, the patents group, by limiting the use to which the patent machinery could be utilized, were able to create monopolies in beer bottles, milk bottles, and prescription ware, thus eliminating competition even among members of the patent pool. Another example of such a limitation was restriction placed by I. G. Farben on the use of a process to manufacture hydrogen and carbon monoxide. The process could only be used to manufacture ammonia for agricultural fertilizers and, therefore, could not be used to manufacture nitric acid, to be used in the manufacture of T. N. T.

The Department of Justice believes that licenses which restrict the use of any commodity are today illegal. Nevertheless, that principle is still to be tested in court. Clarifying legislation is needed to avoid protracted and expensive litigation.

The question of whether a license can be given to one person to use the process to manufacture one article and to another person to manufacture another article is one that is arguable if such licenses are used to protect struggling new industries. Where, however, the restriction on use is employed by a dominating corporation to further an unreasonable restraint of trade, it is a plain violation of the fundamental principle of the Sherman Act and a legislative declaration of that fact is imperatively needed.

The bill would protect any licensee who was sued because he refused to comply with an illegal license by bringing the Government immediately to his aid.

7. *Licenses which restrict production.*—The purpose of the patent system is to

Digitized by Google

promote science and the useful arts. There is hardly any restriction imposed by a patentee more contrary to the purpose of the patent law than the restriction of production. This is a planned scarcity in order to maintain a rigid market. Later I will mention the Rohm & Haas restriction on the manufacture of plastics. This permitted du Pont to manufacture only 50 percent of Rohm & Haas' production. In the glass-container industry each company is given a quota which it dare not exceed under penalty of losing its license. The incandescent-lamp industry has long suffered from this type of restriction. Each licensee concerned is given a quota of General Electric's production for the year. It is interesting to note that the two major companies in this field, General Electric and Westinghouse, retain 80 percent for themselves; 10 percent is parceled out to the other licensees and 10 percent belongs to the struggling independents who are constantly harassed with infringement suits by the General Electric Co.

In view of the purpose of the patent law to promote science and the useful arts, it is interesting to note the effect of this restriction in the incandescent-lamp industry. I quote from a memorandum found during one of our investigations dealing with the effect of this restriction:

"I repeated, of course, what we had told them of our accomplishments and that we would have a great deal to contribute. He said he appreciated that we had done quite a lot of work and that our patents were of value. He brought out how well pleased Westinghouse and Champion were with their set-up and how much more profitable it was for them to cut down their development activities. I told him that we did not agree with such a policy and did not feel that it was for the good of any industry to try to have all developments confined to one laboratory; for example, where would the automobile industry be today if all developments were concentrated in one of the big companies? He replied that, of course, his company had access to all the developments of Europe."

The cases discussed above are, of course, illegal. The penalty of the cancelation of the patent, however, would prove a much greater deterent in the exercising of such patents. And even more important, the illegal restriction would be called to the attention of the Department of Justice the moment an attempt to enforce it was made.

8. *The use of patents to fix prices.*—The abuse of patents as a means of obtaining price fixing is widespread. We give a few examples from the thousands of documents in the files of the Antitrust Division. In an interoffice memorandum from C. L. Bausch to Dr. W. B. Rayton entitled "Patent Protection," dated September 28, 1938, the following statement is made:

"Of our sales in 1937 about half of the products sold were protected by patents, roughly, $5,000,000 on which we paid an average of 5-percent royalty, $250,000 to outside sources for protection on our product *and for buying the means of accomplishing price control. A great deal of money, but apparently justified by the figures in most cases.*" [Italics supplied.]

As another illustration I quote the reply of Mr. Carl Bausch of the Bausch & Lomb Optical Co. to a naive inquiry by one of his staff asking why the company continued to pay royalties on worthless patents. An excerpt reads as follows:

"A great many of the patents that we are operating under are very weak, and if we wished to, we could break them ourselves and not pay royalties, but good business judgment, I believe, justifies the idea of paying royalties even on weak patents in order to maintain a price-control picture that is helpful."

M. J. Root, Jr., of Shuron, a member of a spectacle cartel, a Ful-Vue sublicensee, stated the same belief on August 13, 1935, when he wrote to a Shuron employee, as follows:

"Frankly, the Ful-Vue patents are so weak that they are a tremendous task to uphold, because the American Optical Co. cannot be too severe in its tactics in keeping the licensees in line, *because if they were forced to bring suit, the patents might be knocked out and the whole Ful-Vue license system would topple, and Ful-Vue and Hi Bo products could then be made by anybody at any price, and the nice margin of profit in this business would be lost.*" [Italics supplied.]

The use of a patent which the owner believed to be invalid for the purpose of fixing prices is clearly illegal. Here the bill gives the protection of immediate discovery when suit is brought.

The buying up of patents to fix prices prevents an unclarified legal problem which the bill solves by applying the standard of reasonableness.

A third use of patents to fix prices was approved in the *General Electric case.* In that case the court held that the holder of a patent engaged in the actual manufacture of the product may license his competitors on condition that they follow the prices he fixed. One of the theories of the case was that a patent

Digitized by Google

holder-manufacturer should not be forced to compete with his own licensees. The Department of Justice is seeking an appropriate case in which to ask the court to reverse that doctrine where it can be shown that the patent is used as an instrument to control the market of a commodity.

Clarifying legislation, therefore, is imperatively needed. Frankly we do not like the General Electric doctrine even as applied to an infant industry. We admit, however, some justification if a small concern is trying to get on its feet by manufacturing and therefore requires its licensees not to sell below its own cost. Where, however, the patent holder controls a substantial percentage of the market there is no reason whatever why he should be allowed to consolidate his position by such a doctrine. The bill will limit the doctrine of the *General Electric case* to the protection of small industries, and certainly that is as far as the doctrine should go.

9. *Blocking and fencing patents.*—As an example of this abuse I quote the patent policy stated by the Hartford Empire, which succeeded in levying a toll on every housewife who bought food or drink in jars or bottles:

"In taking out patents we have three main purposes, (*a*) to cover the actual machines which we are putting out, and prevent duplication of them * * *; (*b*) to block the development of machines which might be constructed by others for the same purpose as our machines, using alternative means; (*c*) to secure patents on possible improvements of competing machines, so as to 'fence in' those and prevent their reaching an improved state. * * *"

We concede that under the present confusion there is some excuse for taking out patents with all sorts of doubtful claims as a means of protection. The effect of the bill on such shaky patents would be to confine their use for protection only. Every infringement suit would have to meet this test under the bill after notice to the Government.

10. *Foreign cartel abuse.*—This committee can have no doubt that foreign cartels have operated in this country through our patent system. Gigantic combinations, clearly illegal under the antitrust laws, have been disguised in the form of innocent-appearing patent licenses and have cloaked themselves with the mantle of the struggling, impecunious young inventor. It remained only for the Hitler government to use these cartel agreements in order to further Germany's interests and weaken her potential enemies. As early as 1929 the chairman of the German electric-lamp trust explained how his company was able to maintain restrictive agreements with American firms despite our antitrust laws. He stated:

"We had already very extensive collaboration with the American firms by which mutual patent protection had been obtained. Therefore, we have no reason to be excited about the American antitrust law."

The hormone trust gives us another example. In that case, three European firms dominated by Schering A. G. of Berlin were members of a cartel which operated in this country through three supposedly American subsidiaries. The domination of this cartel over the American companies was so complete that in the underlying cartel agreement it was provided that disputes should be settled by arbitration in Europe. The agreements between the American companies were drawn up in Europe in accordance with the basic underlying cartel understanding. How could these agreements be given legal effect in this country? The license agreements were drawn up in Europe on the basis of patents doled out to the American companies by their European masters. The attorney for one of the European companies was well aware of the American antitrust laws. He stated:

"The questions arising under the American antitrust laws were settled in such a manner as to render the agreements valid under the present antitrust laws as interpreted by the weight of authority in American courts."

The whole intention and purpose and underlying agreement of this cartel as it operated in this country was to maintain a dominating and exclusive position in a rare and important drug. The intention of the parties is indicated by the following memorandum:

"The provision requiring the payment of royalties on products having an 'economically dominating position' whether or not such products are patented, has been omitted. This was done because, as already understood in Europe, Ciba's American lawyers consider it exceedingly dangerous to refer to unpatented products having an 'economically dominating position' as indicating that the intention of the parties and the effect of the agreements would be to give to the parties an effective monopoly in unpatented products. Ciba's American

Digitized by Google

lawyers consider that in the event that the American license agreements should be challenged, either in a governmental investigation or otherwise, any suggestion that the parties intended to obtain a monopoly in unpatented products might cause a doubt on the legality of the entire arrangement governing American business."

The files of the companies disclose their intention—their cartel was to operate in this country under the cover of patent protection. They recognized that in order to accomplish this they would have to see to it that the right party got the paricular patent claim. I quote from the files of one of the companies:

"As it is known, in the United States the antitrust legislation is of extremely great significance. The different agreements which are in the state of preparation in the United States are intended to put all contractors in a position to sell hormone compounds in the United States without any violation of those statutes * * * so far as * * * cross promises to maintain promises exist, this promise is only lawful if the licensee, in this case Ciba, possesses the protection of a patent claim. * * *

* * * * * * *

"According to the information of Dr. Joseph Engi, almost daily new indictments based on the antitrust legislation are made. Under such circumstances it is extremely important to obtain as fast as possible the protection of the most important patent claims.

In connection with one of the proposed transfers of a patent application intended to cover up this cartel scheming, one of the companies objected that "an expert would understand immediately that the transfer of this application served only aims which have to be considered as unlawful according to the antitrust legislation. We couldn't even mention any consideration given to Ciba."

These cartels have operated in the fields of the most important strategic materials. It would be difficult to conceive of three more important elements than magnesium, rubber, and plastics to the proper functioning of our war effort. Yet these and many more were encompassed in a network of patent control which resulted disastrously for this country. Rohm & Haas was forbidden to enter a variety of organic chemical fields, including synthetic rubber, as a result of an agreement with I. G. Farbenindustrie and Rohm & Haas, of Darmstadt, Germany. Furthermore, its domestic agreement with du Pont provided that the latter company could produce no more than 50 percent of the amount of plastics of the Rohm & Haas Co. These plastics are used in making bomber noses and other aircraft parts.

I. G. Farbenindustrie, the largest corporation in Europe, and Standard Oil of New Jersey, the largest industrial corporation in the world, have divided between them world production of synthetic petroleum products and chemicals. It was through this cartel that the Hitler government was able to impede the development of synthetic rubber, acetic acid, methane steam, and other vital chemical products in this country.

The Krupp Co., of Essen, Germany, and the General Electric Co., by means of a patent cross-licensing agreement, were able to restrict the number of producers of tungsten carbide in this country, eliminate those which attempted to compete independently, and raise the price to such arbitrarily high levels that little of the material was utilized in this country despite the fact that it is believed to be one of the keys to the German rearmament program and over 20 times more of the material was used in Germany than here. The resulting monopoly raised the price from $48 a pound to $453 a pound, which had an enormous effect in discouraging its use. The strength of this cartel was so great that it prevented a test of its patents for 12 years, at the end of which time they were proven invalid and worthless.

These and other cartels which have been examined by this committee operated on the basis of the patent system.

First. They gained control of patent claims of important and strategic processes and thus stood in a position where they could deny this country the use of its own resources.

Second. They entered into restrictive licensing agreements with American companies which had these effects: (1) These license agreements concealed from the American public the fact that foreign interests were in a position to dominate our economy. If the American public had become aware of this fact, the pressure would have been such as to have gained immediate patent reform. (2) Through restrictive license agreements these cartels effectively legislated as to what American corporations might or might not do in a manner which would have been

Digitized by Google

prohibited to the American Congress. (3) Thus the ability to put in a license agreement restrictions as to fields of operations, whether geographic or technological, has been the cloak for a control of American companies more binding than outright stock interest.

Third. Through these agreements foreign cartels have control of where and to whom American products may be sold in foreign markets. If we are now worried about the South American market, let us remember that we gave the South American market to the Germans through these patent agreements.

These international patent cartels have been built up under the cloak of secrecy. The bill creates the necessity for disclosure and immediate Government action; first, when the agreements are entered into, and then when an attempt is made to enforce them through infringement litigation. Thus discovery becomes no longer a matter of accident—it is inevitable in the course of the operation of the cartel. And cancelation follows discovery.

Therefore the bill which I have proposed would make it impossible for any foreign cartel to claim that it could exercise strategic control to keep this country from utilizing its own resources. In the first place, the agreements would have to be registered with the Attorney General and therefore some knowledge would be had concerning their existence. Second, any aggressive action in the form of infringement suits would likewise be known to the Department and the Department would act to save American enterprise. Third, the Department would move to cancel the patent right.

CONCLUSION

The abuses of the patent system have long been before congressional committees. In 1912 there were extensive hearings by the Patent Committee of the House under Representative Oldfield; in 1919 there were the Nolan hearings; in 1935 extensive hearings were held before the House Committee on Patents, and again in 1937. In 1938 the problem was investigated by the Temporary National Economic Committee, and, finally, your committee has made an extensive and thorough study of the operation of the patent system.

Today the Government has power to direct the manufacture of any patented commodity leaving the patent owner only the right to sue in the Court of Claims. This remedy is not a cure for the abuses we have enumerated unless we take the position that we want the Government to go into business as the sole alternative to the continued existence of a patent cartel. Actually our purpose should be to encourage independent enterprise both during the war and after the war. Of course, the Government's power to direct manufacture is essential in order to break any log jams that may develop. However, this is no encouragement to the private manufacturer who has a new idea with which he wishes to experiment. Had this remedy been applied in the period immediately prior to the war it would have compelled the Government to go into the business of manufacturing steel and aluminum and light metals and plastics and chemicals, and so on through the list. Such a remedy should be applied as a last resort and not as a positive program for the freeing of private industry from patent abuses. Indeed, it does not free industry; it simply permits the Government to step in and when the Government steps out, it leaves the patent cartel still in control.

The Constitution provides that the patent law shall promote the progress of science and the useful arts. It has been used by patent cartels to sabotage science and the useful arts. Today in a national crisis we face the shortages created by patent cartels. So I believe that in spite of the protests of the defenders of special patent privileges for a powerful minority, we have a better chance than ever before to win our fight to free industry from these indefensible restrictions. And it is important to the American public that we succeed.

We have seen our country weakened, our resources withheld from us, our productive capacity thwarted, because of our failure in the past to correct the misuse of our patent system. The time to strike and strike hard is now.

prohibited to the American Congress. (3) Thus the ability to put in a license agreement restrictions as to fields of operations, whether geographic or technological, has been the cloak for a control of American companies more binding than outright stock interest.

Third. Through these agreements foreign cartels have control of where and to whom American products may be sold in foreign markets. If we are now worried about the South American market, let us remember that we gave the South American market to the Germans through these patent agreements.

These international patent cartels have been built up under the cloak of secrecy. The bill creates the necessity for disclosure and immediate Government action; first, when the agreements are entered into, and then when an attempt is made to enforce them through infringement litigation. Thus discovery becomes no longer a matter of accident—it is inevitable in the course of the operation of the cartel. And cancelation follows discovery.

Therefore the bill which I have proposed would make it impossible for any foreign cartel to claim that it could exercise strategic control to keep this country from utilizing its own resources. In the first place, the agreements would have to be registered with the Attorney General and therefore some knowledge would be had concerning their existence. Second, any aggressive action in the form of infringement suits would likewise be known to the Department and the Department would act to save American enterprise. Third, the Department would move to cancel the patent right.

CONCLUSION

The abuses of the patent system have long been before congressional committees. In 1912 there were extensive hearings by the Patent Committee of the House under Representative Oldfield; in 1919 there were the Nolan hearings; in 1935 extensive hearings were held before the House Committee on Patents, and again in 1937. In 1938 the problem was investigated by the Temporary National Economic Committee, and, finally, your committee has made an extensive and thorough study of the operation of the patent system.

Today the Government has power to direct the manufacture of any patented commodity leaving the patent owner only the right to sue in the Court of Claims. This remedy is not a cure for the abuses we have enumerated unless we take the position that we want the Government to go into business as the sole alternative to the continued existence of a patent cartel. Actually our purpose should be to encourage independent enterprise both during the war and after the war. Of course, the Government's power to direct manufacture is essential in order to break any log jams that may develop. However, this is no encouragement to the private manufacturer who has a new idea with which he wishes to experiment. Had this remedy been applied in the period immediately prior to the war it would have compelled the Government to go into the business of manufacturing steel and aluminum and light metals and plastics and chemicals, and so on through the list. Such a remedy should be applied as a last resort and not as a positive program for the freeing of private industry from patent abuses. Indeed, it does not free industry; it simply permits the Government to step in and when the Government steps out, it leaves the patent cartel still in control.

The Constitution provides that the patent law shall promote the progress of science and the useful arts. It has been used by patent cartels to sabotage science and the useful arts. Today in a national crisis we face the shortages created by patent cartels. So I believe that in spite of the protests of the defenders of special patent privileges for a powerful minority, we have a better chance than ever before to win our fight to free industry from these indefensible restrictions. And it is important to the American public that we succeed.

We have seen our country weakened, our resources withheld from us, our productive capacity thwarted, because of our failure in the past to correct the misuse of our patent system. The time to strike and strike hard is now.

SCIENTIFIC AND TECHNICAL MOBILIZATION

SATURDAY, APRIL 3, 1943

UNITED STATES SENATE,
SUBCOMMITTEE ON SCIENTIFIC AND TECHNICAL MOBILIZATION
OF THE COMMITTEE ON MILITARY AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to call, at 2 p. m., in room 104–B, Senate Office Building, Senator Edwin C. Johnson (acting chairman) presiding.

Present: Senator Johnson (acting chairman).

Also present: Henry H. Collins, Jr., and Herbert Schimmel, of the committee staff.

Senator JOHNSON. The committee will come to order.

We have Mr. William Stix Wasserman present as our first witness. Mr. Wasserman, will you proceed in your own way?

STATEMENT OF WILLIAM STIX WASSERMAN, INVESTMENT BANKER, PHILADELPHIA, PA.

Mr. WASSERMAN. I appear here as an investment banker, in support of this measure, because I believe the bill is of benefit to private enterprise, and to all those whose work, such as that of the average investment banker, is contributory to the use of private capital in the expansion of enterprise. I also feel that the bill is essential for the effective prosecution of the war effort, and that it has most interesting implications for post-war recovery.

My business experience is as follows: Following graduation from Princeton, I was assistant to the president of the Artloom Corporation. Later I became connected with Dillon, Read & Co. and afterward formed the Investment Corporation of Philadelphia, an investment trust interested not only in standard investments but in the promotion of new enterprises. I also helped form the Delaware Fund and the W. S. Wasserman Co., and was president of both. My other connections include the Wilmington Chemical Co. and the Penn Jersey Shipyard in the organization of which the Wasserman Co. was the motivating financial mainspring. I was also director of the New York Shipbuilding Corporation and the Ryan Oil Co. In addition to these I was chief American delegate to the World Economic Conference in Berlin, and was employers' adviser to the International Labor Office in Geneva.

My interest in this bill stems from the financial experience I have had in promoting new enterprises. My belief in this type of enterprise springs from the belief that the owner of capital can best serve his own selfish interest as well as that of the public by putting his

Digitized by Google

capital to work in such a way as to stimulate production of new products, thereby creating more employment and general prosperity. It is my belief that the following out of this policy has been responsible for the economic development of this country and is responsible for our industrial leadership in the world today.

The standard of living of any country can be traced to three sources:

1. The amount of raw materials available.
2. The ability of the people to organize themselves in such a way as to exploit these materials successfully.
3. The amount of technological improvement that emerges year by year, and is put into business practice.

Most present-day inventions have an exceedingly difficult time in finding sponsors, no matter how meritorious the ideas may be. Let me cite two specific cases from my own experience.

Some years ago I was approached by some of my friends in England and asked whether my firm would be interested in backing a revolutionary type of airplane propulsion based on the jet principle. Some of my banking friends had run across a young man in the R. A. F. who had come out with what he claimed was a completely revolutionary idea. This principle was mathematically analyzed by one of the greatest mathematical geniuses in England and found to be correct. Extreme difficulty was encountered in raising funds. A small amount of money was made available, but in the long run the company had to be financed by the British Government to bring this inventor's plan to practical development. This invention may be of first-rate importance in winning this war. I am sorry that I cannot divulge any further information because this company is on the British Government's secret list. But I want to bring out the fact that British capital was not interested in financing this principle and that in an emergency, aid had to be rendered by the Government.

(Discussion off the record.)

Mr. WASSERMAN. Furthermore, a great part of the investment funds that are available in this country are in the hands of trust companies that haven't the right to take risk capital on. In addition I would like to point out that under present methods of taxation—and I am not criticizing one way or the other our methods of taxation, I am only stating a fact—it is almost impossible to get money for new enterprise, because most people that have money realize the hazards of new enterprise. The record of new enterprise is that 9 out of 10 go bankrupt within 5 years, and when you have a tax law that restricts you to 6 or 8 percent on your money, you simply don't put that sort of money into new enterprise, because it is "heads I win, tails you lose".

The thing that lured private capital into new enterprise and lured them to take all the risks that new enterprise involved, was the hope that they would get 100 or 200 or 300 percent return on their capital.

Now that we have—and it is quite necessary in wartime—such a restriction on profit, you simply are unable to raise money for new enterprise when you consider the risks involved.

As a second illustration I would like to point out the case of the Wilmington Chemical Co. About 7 years ago I heard that a group

Digitized by Google

of Viennese scientists had discovered that by treating the sludge waste which comes from the refining of oil, they could obtain a material which was most useful as a rubber extender, since this material had practically the same properties as crude rubber and vulcanized with crude.

When the matter was brought to my attention, I in turn took it to Mr. Francis I. du Pont, who for many years had been research head of the du Pont Laboratory. Despite the fact that Mr. du Pont claimed that it was one of the most interesting chemical discoveries that he had come across and despite the fact that he himself helped me in founding the company, and became the leading financial contributor to the company, nevertheless it was exceedingly difficult to raise capital for this company. Without the benefit of the du Pont backing, the company would have gone under long ago. It took us 7 years to get that company to the point of commercial exploitation. We brought over from Vienna a group of refugees who had been working on the chemical formulas in connection with the product, put them to work in a laboratory in Wilmington, and poured money into that company year after year, and only now is it beginning to bear any fruit. In fact I would say that this month was the first month in its history that it broke even. And yet it is likely that this company will become a leading contributor in solving our rubber problem. Its product has already been accepted generally by the Office of the Rubber Director and by industry in general.

I bring that out because here was a situation that had already been tested commercially in Germany. I am told—I can't vouch for this—that there isn't a rubber tire in Germany that doesn't use the product naftolen, which is what this company makes. What is it? It is a material that is made by chemically treating oil sludge, which is the waste of an oil refinery. It has exactly the same chemical properties as rubber and joins with rubber and vulcanizes with it. If you add 50 percent of this material to 50 percent of rubber, you get a new type of rubber. It is now being extensively used in the rubber shoe industry, and the new product is just as good, if not better, than pure rubber. It has better properties and it is being used in tires and for all sorts of other rubber uses. Yet in spite of the fact that it is a low-cost material, one which could actually compete in cost with rubber, we had a very difficult time in getting private capital sufficiently interested to make this company go, and if it hadn't been for the courage and faith of Francis du Pont, this company wouldn't be in existence today.

Senator JOHNSON. Will the plant shut down as soon as natural rubber comes back on the market?

Mr. WASSERMAN. No, it will not; because it can compete in price with natural rubber and it has certain properties, when added to natural rubber, that are exceedingly advantageous. For example, it permits the addition of larger amounts of carbon black, which is the cheapest material that goes into the finished rubber product.

Senator JOHNSON. You don't advocate, then, destroying our synthetic rubber plants as soon as the war is over, in order to promote foreign trade?

Mr. WASSERMAN. No, I certainly do not.

Digitized by Google

I just want to add that in view of my 15 years in investment banking and in the promotion of new enterprises, I am convinced that this bill can do much toward developing many useful inventions to the point where private enterprise itself can carry along the burden and make the fruits of the imagination of our inventors available to the public at large. I see great fields of opportunity for the investment banker in financing new enterprises based upon new inventions and discoveries which have been brought through the pilot-plant stage by the proposed Office of Scientific and Technical Mobilization and are ready for commercial exploitation. When I refer to "this bill" in my remarks, I have reference to S. 702.

There is just one other thing that I would like to add extemporaneously and that is that I feel that these are times when we can't look at everything through financial glasses. If we did, we wouldn't be sending ships, that are likely to be sunk, across the sea. We have to take chances today that we wouldn't ordinarily take in peacetimes. The Government is the only agency in position to take these very large financial chances.

If we wait for some of these inventions to reach the point where they are attractive to private capital, we will miss out perhaps on some of the most important inventions that can contribute to our victory in the war. I think that we have to get into the habit of thinking not in financial terms but in terms of war opportunities often involving considerable risk.

We have to apply the same perspective to new inventions that we take in every bombing raid and every fresh offensive. Perhaps 9 out of 10 inventions backed by this corporation that you are proposing to bring to fruition, will be no good, but maybe just that one-tenth may be the invention that will cure the submarine evil or give us a new type of airplane, or a new type of explosive, and bring this war to an end. The reason I am here is that I feel so strongly about this.

I remember 3 years ago Mr. Simon Lake came to me—he was the inventor of the submarine, you may remember—he came to me with a series of inventions. Some of those might be of use today. One of them appealed to me exceedingly; it was a small submarine similar to the type that the Japanese have used—one of which has just arrived in Washington on exhibit. He would have been able at that time to build them by the thousands, at a very low cost. His idea was that if we had those in the harbors of the outlying islands such as the Philippines and Hawaii, always on guard duty as part of our defense, they would make a very important contribution to the defense of this country.

I was enthusiastic about the idea but I couldn't get to first base with anyone. Yet if there had been an agency of this sort I am sure that they would have built one model submarine, perhaps 2 years ago, and tested it to see whether it was any good or not. It might have changed things both at Pearl Harbor and in the Philippines.

Mr. COLLINS. What specific obstacles did you encounter in trying to finance Mr. Lake's idea?

Mr. WASSERMAN. We couldn't get any orders to begin with, and until you actually had orders on hand you couldn't get any financial group interested in it.

Digitized by Google

Dr. SCHIMMEL. Did you have the vicious circle that you couldn't get orders because you didn't have a tested model?

Mr. WASSERMAN. Yes. I am sure that if Mr. Lake could have taken a tested model down to the Navy Department and said, "Here it is, come and look at it," we might have had a chance of selling the idea to the Navy.

He also had at that time an idea for a large cargo-carrying submarine. If we had had three or four cargo-carrying submarines of large dimensions we might have been able to hold out in the Philippines considerably longer.

Senator JOHNSON. Yes, Mr. Lake presented that idea to a subcommittee of the Senate Military Affairs Committee, and all the members of the committee were greatly impressed by what he advocated, but we couldn't get the Navy to see it that way, or the merchant marine, or anyone in Government.

Mr. WASSERMAN. I don't know that Mr. Lake's plans were correct. The reason that predisposes me in his favor is that he was the first man in the face of all obstacles actually to build a submarine, so he must know a great deal about them. He was the inventor, and he came to me and said, "Here are plans for a cargo submarine; it may save our life in war."

If we had a group of cargo submarines now, and large ones, part of our shipping difficulties might be eased considerably. But I am not an authority on these things, I am just talking as a financial man, and saying that private capital isn't in any position to undertake either pilot plants or large scale models until they have something much more certain to go on than merely the fact that this is an interesting defense proposition.

Senator JOHNSON. I think your point is very well made and your testimony is in line with the opinions of those in Congress who believe that S. 702 is the answer to some of these problems.

Mr. COLLINS. Do you see any danger to investment banking in the Government going into the development of new inventions through the pilot plant stage?

Mr. WASSERMAN. I can see only that it would help. I cannot see anyone who is interested in private capital not wanting every avenue opened up to the development of new technological processes. If there is any danger it would come after and not before the pilot plant stage, and if it is going to be the policy of the Government to make these pilot plants and inventions available to private enterprise, then I can't see any danger.

What most businessmen fear is what they call unfair business competition with government. No private entrepreneur can compete with government on fair terms because the bookkeeping is quite different, as you realize. But if you are going to make these inventions available where they fit into the pattern of private enterprise, available to private enterprise even on a competitive basis, I should think that private enterprise would welcome them.

Dr. SCHIMMEL. There would be, of course, one very great difference in the exploitation of such inventions from the exploitation of the inventions that now come from private industry.

Section 7 of this bill provides that once the Government has assisted in developing an invention, it must be made available to all

Digitized by Google

comers so far as that is consistent with national defense. Normally when an invention is developed in private enterprise one or two companies get a corner on that particular invention and develop it as an exclusive project.

Mr. WASSERMAN. When they have spent the research money themselves, they are entitled to that protection for a period of years; but if it is Government and public money that has done the spade work and taken the risk, I can't see why private enterprise would object to having the invention thrown open to all companies.

As a matter of fact, one of the things that justifies private enterprise is the necessity of keeping competition high, wide, and handsome, because competition forces efficiency on private enterprise which results in lower prices to the public.

Dr. SCHIMMEL. Mr. Arnold said the other day that that was their boast, but not a fact.

Mr. WASSERMAN. Well, why not accept the challenge of private enterprise? I am sure that if there is a public demand for a product, the fact that there is competition won't prevent private enterprise from making full use of it.

Mr. COLLINS. You said something about examining very closely the merits of all inventions during war, and leaning over backward to discover new ones that might, at first sight, not appear to be practicable. Do you think that any provision should be made in this bill to bring that about more adequately?

Mr. WASSERMAN. I think that the emphasis in this bill ought to be that every new invention, even if it appears a little crackpot at first sight, which many of them will, should be given a thorough review and responsibility should be on the fellow that turns it down. This is no time for financial caution. That doesn't mean for one moment that we should leave the door wide open and try out a lot of damn fool schemes, but I think that we have got to do away with what I would call normal business caution in wartime, and be prepared to build a lot of pilot plants and inventions that may find their way to the scrap heap eventually, in the hope that we may get two or three that will be so revolutionary and so worth while that they will contribute to victory.

Senator JOHNSON. Why do you confine that to wartime?

Mr. WASSERMAN. The necessity is upon us in wartime.

Senator JOHNSON. That spade work should have been done before the war came, shouldn't it?

Mr. WASSERMAN. That is perfectly true. I would say that with any inventions that relate to national defense we should keep an open mind, as open a mind as possible. There is always the tendency—as I have discovered in my experience—when dealing with engineers especially, to turn the other fellow's idea down. It takes too much trouble to investigate it, usually, and there are always reasons why it can't be done. Every worth-while invention of the past hundred years had a group of people who said that it was impossible.

Certainly the great mass of people never thought we would fly, and I know that if 25 years ago somebody had said that I could talk across the Atlantic through the ether, without even the use of a wire, I would have been exceedingly skeptical.

I feel that we must have as open a mind as possible and that the emphasis of this bill should be not to penalize the officers of this

Digitized by Google

corporation for making mistakes, but to encourage them to take risks if the risks have some justification.

Mr. COLLINS. Do you think there should be a committee of appeal to which an inventor could go if he is turned down by this organization?

Mr. WASSERMAN. I really can't answer that question, I don't know.

Mr. COLLINS. What kind of an administration do you think would be the best to administer such an organization as this?

Mr. WASSERMAN. I would say a hard-boiled visionary, if you can get that sort of man.

Senator JOHNSON. Mr. Wasserman, we have some other witnesses who were asked to come here at 2:30, and with your permission we would like to go on with them now and then talk with you further a little later.

Mr. WASSERMAN. Certainly; I will be here available for you.

Senator JOHNSON. Thank you.

We next have the representatives of the Association of Land Grant Colleges.

(The following representatives of the Association of Land Grant Colleges were present:)

R. E. Buchanan, dean, college of agriculture, University of Iowa; R. B. Corbett, dean, college of agriculture, University of Maryland, College Park, Md.; L. D. Baver, director, agricultural experiment station, North Carolina State College, Raleigh, N. C.; Edmund Secrest, director, Ohio State Agricultural Experiment Station, Wooster, Ohio; C. R. Orton, dean, college of agriculture, West Virginia State University, Morgantown, W. Va.; C. E. F. Guterman, director, agricultural experiment station, Cornell University, Ithaca, N. Y.; W. A. Lloyd, director of information, Association of Land Grant Colleges.

Dr. CORBETT. We have three witnesses here this afternoon who are going to make statements, and if agreeable to you I will call on them in turn.

Senator JOHNSON. Just as you wish.

Dr. CORBETT. Our first witness will be Dr. Buchanan of the University of Iowa.

STATEMENT OF R. E. BUCHANAN, DIRECTOR, AGRICULTURAL EXPERIMENT STATION, COLLEGE OF AGRICULTURE, UNIVERSITY OF IOWA, AMES, IOWA

Dr. BUCHANAN. My name is R. E. Buchanan; I am director of the Agricultural Experiment Station of the Iowa State College at Ames, Iowa.

This committee, Mr. Chairman, desires to tell you who we are and what we represent, and the exact reasons, so far as possible, for asking the courtesy of this hearing.

Dr. Corbett is our chairman and is chairman of a subcommittee made up of directors of agricultural experiment stations. We constitute a subcommittee of a larger committee on agricultural experiment station organization and policy. We have been authorized by the executive committee of the Association of Land Grant Colleges to make this presentation.

We represent the 53 agricultural experiment stations of the United States, including the experiment stations of Alaska, Hawaii, and Puerto Rico.

Digitized by Google

On the State level we represent sections of governmental activity in research and education. Our purpose in appearing before your committee is threefold:

1. To outline briefly the nature and scope of our agricultural experiment stations.

2. To explore with you some of the implications of S. 702 with reference to these stations and to suggest careful study and scrutiny of certain sections to enable you to avoid, if possible, any undesirable disruption of our cooperative research relationships now established and functioning.

3. And I would like to make this quite clear—not to assume a role either of advocacy or of unsympathetic criticism of the bill, but rather to place before the committee, as objectively as is possible, facts which we believe will be valuable in your final formulation of a bill which will, if enacted, do quite exactly what you want done.

May I emphasize that we are authorized neither to endorse nor to refuse to endorse a bill, but to be as cordially helpful as possible in this discussion.

Now first, a brief statement as to just what the stations are and why we are interested.

The State agricultural experiment stations of the United States are a natural outgrowth of a demand from agriculture, as a major industry of the Nation, for assistance. This demand led, nearly a hundred years ago, to the foundation in several States of colleges in which the teaching of agriculture should be emphasized, together with other lines of work.

Later the Congress gave endowments in the form of land grants to each State, and for the last three-quarters of a century every State has developed such an institution.

Naturally these college not only taught agriculture but studied agriculture, that is they started research. Soon there were several agricultural experiment stations established.

About 55 years ago the Congress adopted a policy of grants-in-aid to any State that wished to establish such an experiment station. All of the State legislatures accepted the proffer and each has now at least one such station—53 all together. Since that time there have been additional grants-in-aid authorized and appropriated by the Congress to the States.

It should be emphasized that these stations were created by the respective State legislatures. They are not Federal institutions.

Taking into consideration current use of physical facilities as well as current expenses, considerably more than two-thirds of the funds expended by these stations are derived from non-Federal sources. These agricultural experiment stations taken together constitute, I believe, the greatest integrated research organization in the United States. Certainly when one adds the complementary research facilities and personnel of the United States Department of Agriculture, there is probably nothing strictly comparable anywhere in the world.

The stations spend annually on their research programs about $23,000,000. The States accept the responsibility of providing most of the land and physical plant needed, and most of the funds required for the financing of the solution of problems that are primarily of State interest.

Digitized by Google

We are making this statement so that it may be evident why the land-grant colleges, of which in general the agricultural experiment stations constitute a part, are vitally and intimately concerned in S. 702, in which there is contemplated a new set of relationships.

The job of the agricultural experiment stations is of course to help agriculture, that is, if you please, the farmer, by solving the innumerable problems with which he is confronted.

It must be remembered, of course, that the farmer is both producer and consumer, and many of the problems naturally are in the field of consumption, and their solution benefits all consumers, which means the entire American public.

For example, a very considerable part of our modern advances in human nutrition, proving so important in our wartime economy, have stemmed from the work of these agricultural experiment stations. The coordinated researches of these stations and the United States Department of Agriculture have been and are so widespread and important that it would indeed be difficult, I believe, to find a farmer in the United States who is not making daily use of the information which they have provided.

It would take entirely too long to enumerate the economic advantages which have accrued from the work of the stations. In my own State of Iowa, almost every acre of corn, of oats, of soybeans, and so on, is planted with seed which owes its quality, and in many cases its origin, to the work of the station and of the United States Government in cooperation.

You will recognize then that the enactment of S. 702 will bring a whole series of new Federal-State relationships. It is necessary, we believe, to explore this matter of interrelationships and implications if your committee is to have a clear picture of just what is agriculturally involved in the States in respect to the proposed act.

The stations, in most cases, are organized as parts of land-grant colleges and universities. Included in these are some of the greatest educational institutions of the world. The stations are not independent entities and cannot be considered separately from the schools to which they are attached.

In our presentation, therefore, it will be necessary occasionally to include statements which relate to the institutions as a whole, rather than specifically to agriculture or to the experiment stations.

These stations are chartered by their respective States to carry on research for the good of the farmers in the State. They receive most of their funds, two-thirds in fact, from the State and must be properly integrated into the general government of the State.

We are interested, therefore, in pointing out any statements in S. 702 which we believe might lead to future difficulties in Federal-State relationships, or to any conflict in authority.

We wish to explore some of these matters with you. The conditions in the various States are quite different. Certainly you don't wish any failure of functions on the State level through withdrawal of adequate autonomy needed for efficiency.

The problems of agriculture are also frequently regional in nature. The work of one station frequently has its implications throughout an agricultural region.

Now to prevent duplication on the one hand, and to get adequate coverage on the other, there must be suitable relationships developed

Digitized by Google

among the several stations in an agricultural region. This has been done. The directors of each of these agricultural stations in the four main agricultural regions meet regularly and map out the areas in which cooperation seems most desirable.

For example, in the Corn Belt, with which I am most familiar, studies of the problems of marketing of livestock have been made by the cooperation of 13 of the agricultural experiment stations. When we got into it we found that it was quite important that the Department of Agriculture, on the national level, also be included. We invited them to work with us and they accepted the invitation. There is now in print a volume giving the results of this study, published jointly by these 13 States and the Federal Government.

What I am trying to do is to point out that we have, on a regional level, developed a technique of cooperation among States which, as we gain experience, is proving more and more satisfactory on that regional level.

Senator JOHNSON. Are these regional cooperative movements encouraged by the Federal Government or are they entirely brought about through independent action of the States?

Dr. BUCHANAN. They originate in both ways, and I think should originate in both ways. In this particular case, speaking of the livestock marketing, a number of the States found that they were much interested in this particular problem and began to get together, and finally in our regional group it was decided that the problem was big enough, was one on which study was urgently needed, and we invited the Federal Government to come in. So in that case the initiative was on the part of the States. I could point to other examples in which the initiative for the cooperation has been on the part of the Federal Government.

For example, in the Corn Belt we have, in most of the agricultural experiment stations, programs for the development of better hybrid seed corn. This program is in the individual stations in most cases cooperative with the Bureau of Plant Industry. We found that the methods of releasing these inbreeds necessary for the production of the bybrid seed corn were different in the different States, and it was causing confusion. The Federal Government suggested, through the Bureau of Plant Industry, that we ought to get together, and a regional conference is now regularly held in which the men concerned with the plant breeding program get together and we have a coordinated system. In that case the initiation was from the Federal Government. Does that give you the information you desired?

Senator JOHNSON. Yes. That is very interesting testimony for this reason: we hear a great deal of criticism these days about regional governmental units, set up by the Federal Government, which are said to destroy State boundaries and substitute a new form of government in this country. I wonder if you have noted any such dangers? Has the Federal Government undertaken to take over and run the show, or is it willing to cooperate and be helpful? You don't have to answer that question if you don't want to.

Dr. BUCHANAN. I will attempt to answer that question. From the standpoint of research—and that, of course, is the thing in which the agricultural experiment station is particularly involved—I think I

Digitized by Google

can say that there has been very little serious interference on the part of the regional agencies which have been set up. There certainly has been most excellent cooperation among the States themselves and with the Federal Government in the type of regional situation which I have been discussing, where the initiative to get the States together for a specific problem originates either with the Federal Government or with the States.

The ones that I have been discussing have not involved the setting up of permanent regional staffs. For the most part they concern particular problems and the staffs are set up temporarily and when the problem is solved we go on to something else.

Now the regional offices to which I think you refer are in practically all cases in connection with the so-called action agencies, such as A. A. A., the Soil Conservation Service, and others.

Senator JOHNSON. That is correct.

Dr. BUCHANAN. Now while we have some contacts in the agricultural exeriment stations with these agencies, they are not set up primarily as research agencies, and I think that a fairer answer to your question could come through an agency like the extension services in the several States, which have more intimate and direct relationships with the action agencies. Does that answer your question?

Senator JOHNSON. Yes; I think so.

Dr. BUCHANAN. I am not trying to dodge the question at all.

Senator JOHNSON. The answer, I take it, reduced to one word would be no?

Dr. BUCHANAN. So far as the agricultural experiment station is concerned. If I were an extension director, I think I would say yes, that there has been interference, but I am not an extension director. However, there are some here who function also as extension directors.

The same is true on a national level. The expreiment stations, through their national organization and through their committees, are coperating actively on problems which must be studied State by State, and then the whole story put together.

I think in some of those cases again the initiative for such a country-wide study has come from the States themselves. In other cases, the suggestion has been put to the States by the Federal Government.

For example, there is a Nation-wide survey being made at the present time, in cooperation with the agricultural experiment stations and the Federal Government, of the vitamin content of butter. Strangely enough at the present time in regard to butter, one of our most common foods, one that we ordinarly think of as supplying a good deal of vitamin A, we don't know the amount of that vitamin ordinarily consumed or found in butter as it is passed over the counter.

The only way to do that is to make a Nation-wide survey, and methods of collecting samples and so on have been agreed to cooperatively by the Federal agencies and the State agencies.

Now a word as to our relationship to the Federal Government, and particularly to the research agencies of the United States Department of Agriculture. These are numerous, important, and critical. These are areas in which there should be, and is, most active cooperation.

Digitized by Google

For example, when the Bureau of Plant Industry introduces new plants or varieties, or desires to breed them, the work must be done in the States. In consequence there are literally hundreds of projects relating to plants, their breeding, disease control, and so forth, which are financed jointly by the Bureau and the various stations. That has proved exceptionally satisfactory. The ability of American agriculture to rise to the production of greatly increased food supplies in the present emergency is attributed, I believe, quite directly to this cooperative work between the Federal Government and the States. We now have excellent and highly satisfactory coordination of our work on the national level by the Office of Experiment Stations, Research Division, United States Department of Agriculture. With a minimum of centralization of authority there has been evolved a maximum, we believe, of coordination. This office, since its inception, has been headed by a series of agricultural statesmen.

May I suggest, then, that a study of this well-knit series of public service institutions might give some suggestions as to techniques in handling of State-Federal relationship as they relate to the public service organization such as ours.

Mr. Chairman, this is simply to get the topic before you and so that you would understand our point of view and our background. Dr. Corbett will take up if you have no questions.

Senator JOHNSON. Do you have any questions?

Mr. COLLINS. Not now.

Senator JOHNSON. Dr. Corbett.

Dr. CORBETT. The second statement will be made by Dr. Orton of West Virginia.

STATEMENT OF C. R. ORTON, DEAN, COLLEGE OF AGRICULTURE, WEST VIRGINIA STATE UNIVERSITY, MORGANTOWN, W. VA.

Dr. ORTON. It appears to us that S. 702 affects the organization, the past development, and the present operations of the State agricultural experiment stations, as just described.

Some of the points in the bill that affect these stations are:

Point 1—Section 1, item (6), page 3:

to aid, encourage, and protect the research and enterprise of inventors, scientists, technicians, scientific and educational institutions, research laboratories—

There the meaning of the word "protect" is not clear. There are already in existence 28 research foundations established by land-grant institutions for the specific purpose of protecting their research personnel with respect to patent rights and the relations of such patents to the public interest. Some of these research foundations have been in existence for many years and have had a highly successful history. It has been the experience of these research foundations that some inventions, which affect a relatively small number of persons, must be developed on an exclusive basis to assure their commercial development. This actual experience should be recognized in the wording of S. 702, we believe.

Point 2—Section 1, item (8), page 3, line 25:

to promote interest in scientific and technical education, and to privide for all qualified persons the means of scientific and technical training and employment.

Digitized by Google

Since the 53 agricultural experiment stations we represent, taken in the aggregate, we believe, constitute the largest research organization in the world, and since most of the scientific and technical personnel available for agricultural research has obtained actual practice and experience in the agricultural experiment stations, we feel that clarification of the intent of this section should be made insofar as it relates to a system of training already well established and operating sucessfully.

The agricultural experiment stations are quite generally an integral part of a land-grant college or university which engages in the fundamental training of scientific workers, many of which feed directly into the research laboratories of the experiment stations. We are therefore part of a rather complete organization for both training and experience in the scientific phases of agriculture.

Mr. COLLINS. I take it you mean that, in carrying out this purpose, the 53 agricultural experiment stations should not be overlooked, that their facilities should be completely utilized, and that no unnecessary duplicatory apparatus should be set up?

Dr. ORTON. Yes. We feel that our organization already pretty largely fulfills the point that you have in mind here.

Dr. SCHIMMEL. Witnesses appeared here during the previous session who suggested that a great deal of new work should be started with reference to labor productivity in agriculture. They particularly suggested the application of the time and motion techniques, though with not quite the precision that they are employed in industry, to agricultural operation.

Now it is your thought, I gather, that if an office is established under this bill which would attempt to initiate such a program, that the resources of the existing agricultural colleges and experiment stations should be utilized for that purpose, and you would like a clarification of that particular question?

Dr. ORTON. Yes; we would want our institutions used, if they would be useful in the program, naturally.

Senator JOHNSON. But, Dr. Orton, you are more interested in maintaining your present status, without being curtailed or supplanted, than expansion? Your expansion, I take it, would come naturally, there are no handicaps on your expansion, are there?

Dr. ORTON. Not particularly; no. We feel that we have a system of training and experience that is well established and has been sucessful over a long period of years, and that this particular item doesn't apply so particularly to us.

Senator JOHNSON. The intention of the bill, I think, is not to supplant anyone who is already doing the job.

Dr. ORTON. Well, that clears up that point.

Point 3—section 1, item (11), page 4:

to standardize, when in the public interest, scientific and technical designs, practices, and specifications.

Since successful research depends upon individual imagination, initiative, and resourcefulness, this section should be clarified and limited so that the very basis of progress in research is not injured. It should be recognized further that the solution of many problems depends upon adaptation to local situations and conditions.

Digitized by Google

In the social sciences, for example, the practices followed affect the results obtained. Standardization could be carried too far unless limited to identical problems. Standardization of procedure is desirable in many case, but standardization of research is inimmical to personal initiative and imagination.

Senator JOHNSON. I think your statement would be pretty hard to oppose.

Dr. SCHIMMEL. Dr. Orton, is there room for more work in the field of standardization, particularly of design, if one takes into account design of consumer products and industrial raw materials, as well as laboratory equipment?

Dr. ORTON. Well, I expect there is. Ordinarily I think we come to those matters of standardization as we progress in the world. Eventually we get to the point where we see so many items that are similar, and yet not alike, that we feel that standardization would be helpful all along the line, and then we proceed to standardize.

For example, there was built up in this country a fertilizer industry involving a large number of formulas by different fertilizer companies. Some States I believe licensed as many as 30 or 40 different formulas for fertilizers. A few years ago we got the fertilizer people together, talked this matter over, and they all came to the conclusion that it was unnecessary to have so many different formulas for fertilizers, and so they started in on a standardization of these; and we brought them down until in our State we now license, I believe, 5 formulas instead of 25 as we formerly did.

Senator JOHNSON. That is a very excellent example of the objective in paragraph 11. Something might be done in the standardization of farm machinery that would be very helpful to the farmer?

Dr. ORTON. That is very probable.

Dr. BUCHANAN. May I interject just one statement?

Senator JOHNSON. Certainly.

Dr. BUCHANAN. There is no objection so far as I know on the part of the directors to paragraph 11 when the proper emphasis is placed upon "when in the public interest." You will note that it says, "to standardize, when in the public interest." We simply feel that it would not be in the public interest to overstandardize things like research techniques and so on, where the field is still wide open. Isn't that a reasonable statement?

Dr. ORTON. Yes.

Senator JOHNSON. In other words, you don't want to stifle competition?

Dr. BUCHANAN. Precisely that.

Dr. ORTON. Point 4—section 1, item (11), page 4, line 21:

and to coordinate the activity of these facilities and personnel, where necessary, in the national interest.

The intent of the wording proposed under this section should be clarified from the standpoint of its possible effect upon the research programs of the agricultural experiment stations which are based primarily upon local problems. However, attention is frequently given to problems of regional and national interest, as already pointed out. It should be emphasized again that through a long period of years a voluntary and cooperative system of coordination of research

Digitized by Google

in agriculture has been developed between State and Federal agencies operating in this field.

It is also pertinent to call attention to the fact that the agricultural experiment stations have carried on cooperative investigations with industry over a long period of years.

Dr. SCHIMMEL. Would you differentiate between a peacetime period and a wartime period as to the need for Federal coordination, and the degree of such coordination?

Dr. ORTON. I think the necessities of war naturally bring us into more active coordination of our activities. We have been doing this coordination for years, but at the present time I should say that it has increased 50 to 100 percent, perhaps, since the war.

Dr. BUCHANAN. Easily.

Mr. COLLINS. I take it you feel that there is a great deal to be learned from the type of coordination that has already been worked out and developed through the years in your own organization?

Dr. ORTON. Oh, yes.

Dr. SCHIMMEL. Your emphasis would be presumably on voluntary coordination, where the people who are being coordinated and the coordinator have no compulsory powers with respect to one another; but that any coordination which is achieved is the result of give and take between the two parties involved?

Dr. ORTON. That is right.

Dr. SCHIMMEL. Now assuming that there was a limitation placed upon this during peacetime, would there be room for a more rigorous interpretation of "coordination" during wartime?

Dr. ORTON. Well, just what do you mean, may I ask, by "rigorous"?

Dr. SCHIMMEL. If you have an agency of this type, would it be justified in giving directives to organizations like yours, rather than just coming to you and trying to work out something of a voluntary character?

Dr. ORTON. Well, the central Federal organization, I expect, would have a perfect right to do that.

Dr. BAVER. May I make a statement in that regard?

Senator JOHNSON. I would be very happy to have you.

Dr. BAVER. I might give you an illustration of what has happened as a result of the war effort. All the experiment stations in the country, in cooperation with the Office of Experiment Stations, have what they have called streamlined their entire research projects to the war effort, with the exception of those fundamental things that you have to carry on so that you don't lose ground.

Mr. COLLINS. Can you give us an idea of the percentage figures?

Dr. BAVER. Between 75 and 80 percent; I believe it is 77 percent.

Mr. COLLINS. That is the percentage of your work that is now on a war basis?

Dr. BAVER. That is right; and the other 23 percent is on the fundamental stuff that we have to do as we go along.

Mr. COLLINS. Is that in terms of money, personnel involved, or number of projects?

Dr. BAVER. That is in terms of projects, of the work.

Now that has come about on a voluntary basis and the type of cooperative set-up that we have, which was successful through long years of experience working together, makes it easily possible to do that; we don't have to have directives.

Digitized by Google

Dr. SCHIMMEL. Your experience, then, would suggest that where you have voluntary cooperation existing in peacetime, it is perfectly adequate for wartime situations?

Dr. BAVER. It proves so in our case; yes, sir.

Mr. COLLINS. I take it that you regard the coordination about which you have testified as having certain exemplary features for sectors of the economy other than agriculture, that you have led the way in certain respects in promoting coordination of research, more so, perhaps, than has been done in industry?

Dr. BAVER. I say that we are not perfect but we feel pretty proud of the progress we have made.

Dr. SCHIMMEL. Isn't it true, then, that the basis of the peacetime coordination of your work was its dependence on public funds and your recognition that you must coordinate it both to the local and national interest at all times?

Dr. ORTON. Our whole background is one of performing a service for the public good. The minute we have information that we feel is sound it is released and becomes public property. We have nothing to cover up. And I think that is one of the features that enables us to do these things in a voluntary way. We haven't anything to fear that somebody is going to lose his investment because we have disclosed some discovery we made.

Senator JOHNSON. You feel then that coordination need not come down from above?

Dr. ORTON. In our case.

Senator JOHNSON. That it is a natural development?

Dr. ORTON. In our case.

Dr. CORBETT. I believe, Mr. Chairman, I could answer that question a little more specifically with an actual illustration.

The Northeastern Experiment Station directors, including 12 States, meet several times a year, and if I recollect correctly—this is very close to the correct date—in January 1941, which you will notice was some time before Pearl Harbor, these directors suggested that they set up a committee, and a committee was set up, and I was chairman of it, to streamline and coordinate the work of the stations in the light of what we expected to happen. That was anticipation, and that came from the individual stations, and we believe that that is the sound way for it to come, from the local people, and come on up, and we think we led the parade in anticipating what was going to happen.

Mr. COLLINS. How much of a switch from peacetime work to war work resulted in that ensuing year?

Dr. CORBETT. I recall that in November 1941, at the national meeting of the station directors, a paper was given on this subject and it was discussed quite a bit, and already a considerable percentage of change had been made.

Mr. COLLINS. We wouldn't expect much of the 77 percent that Dr. Baver has mentioned to have been made before Pearl Harbor, but some of it was?

Dr. CORBETT. Yes.

Mr. COLLINS. I take it that you believe that coordination should operate both on the local level and on the national level?

Dr. CORBETT. That is right.

Digitized by Google

Mr. COLLINS. Perhaps this bill should have spelled out more fully the desire that Senator Kilgore had to promote regional coordination. He feels very strongly about that. It is implicit in the bill but I don't know that it is spelled out as much as it could have been.

Dr. ORTON. We thought that it ought to be a little more explicit.

Dr. BUCHANAN. May I make one suggestion? It is possible that in war emergencies items which can be handled most adequately by the agricultural experiment stations would be unknown to the stations. Certainly it is the duty of some Federal or national agency to call that matter very forcibly to the attention of the stations. Then if there was any disposition on the part of the stations to refuse to go along on something that was significant and of war emergency character, there certainly should be some power to handle a thing of that kind. None of us would dispute that at all.

We believe that the more nearly the approach to the stations could be patterned on the approaches that have been developed, the more satisfactory and the quicker would be the response.

Senator JOHNSON. And you would confine that entirely to time of war?

Dr. BUCHANAN. I believe, Senator, I would from the standpoint of, shall I say, enforcement. Certainly it is the duty of any Federal agency that sees a problem that can be solved by the coordinated activity of our stations to present it to us, and if there were a refusal to do something, to get into some field which manifestly was for the good of the Nation, there ought to be some power to get us lined up.

We believe that the reaction would be such that any force or directives would be quite unnecessary, at least that has been our experience in the past. We have never had any occasion of that kind arise—perhaps I should put it that way.

Senator JOHNSON. In time of war, and wars are conducted by the Federal Government, we naturally anticipate and expect directives—and if we don't, we should; we simply have to have directives, there has to be coordination throughout.

Dr. BUCHANAN. That is right.

Senator JOHNSON. In a totalitarian war—and that is the kind of wars we have. So you would anticipate a directive in time of war?

Dr. BUCHANAN. Yes.

Senator JOHNSON. But in time of peace?

Dr. BUCHANAN. In general, I would say no; that the power to enforce might be questionable.

Dr. SCHIMMEL. May I ask you a question there, Dr. Buchanan? Would the bill seem adequate in that respect in that it provides that during wartime the proposed office could requisition facilities which were not being made available for war needs, by the determination of the office, but that this requisitioning power would be terminated immediately after the war?

Dr. BUCHANAN. Well, that particular topic I don't think has been discussed by the committee. My own personal feeling is that if there are unused facilities in time of war there should be the full power to insist upon the utilization of such facilities.

Senator JOHNSON. Of course, the Commander in Chief has that power.

Digitized by Google

Dr. BUCHANAN. That is right, and we wouldn't want in any way to say that there should be any exception made of the State facilities or experiment station facilities.

Dr. ORTON. I think that is correct.

Dr. BAVER. Along that line, Dr. Schimmel, I think this is true, at least it is in our institution, that we have 100 percent of our facilities used in that regard. As a matter of fact we are shy on facilities so far as doing some things that we ought to do, now. I believe that is probably true of every experiment station.

Mr. COLLINS. Is it true that your present facilities are 100 percent in use?

Dr. BAVER. That is right.

Dr. ORTON. Point 5—section 3, items (c) and (d), page 7. Item (c) refers to the establishment within the Office of a National Scientific and Technical Board; and item (d) to a National Scientific and Technical Committee.

These paragraphs establish a National Scientific and Technical Board and a National Scientific and Technical Committee. In spite of the fact that a large part of all of the research now under way in the United States is conducted in educational institutions, no mention is made of a representative from these institutions on either body. Agriculture is not given representation on the National Scientific and Technical Committee.

Senator JOHNSON. Pardon me just a moment, I didn't quite get that point, Dr. Orton. I notice in line 11 it says—

and to include one representative each for industry, agriculture, labor, the consuming public, and two additional members at large who shall be scientists or technologists.

What was your point?

Dr. ORTON. That the educational institutions are not mentioned here, that is the universities.

Senator JOHNSON. Agriculture is but educational institutions are not?

Dr. ORTON. Agriculture is in paragraph (c), but is not in paragraph (d), and the universities are not mentioned in either.

Dr. SCHIMMEL. It might be interpreted as being represented in section (d) if you interpreted the phrase on line 2, page 8, "in the major fields of production and service" as including agriculture as one of the major fields of production and service.

Dr. ORTON. That might be so. We wanted to call attention to the point.

Senator JOHNSON. I think that is a very good point.

Dr. ORTON. Point 6—section 4, item (b), page 8, line 24:

To formulate and promote projects and programs for the development and use of scientific and technical facilities and personnel and, when necessary, to initiate and carry out such projects.

According to this section, the powers of the Office of Scientific and Technical Mobilization include the following—which I have already quoted. When this item is read in connection with sections 2 (a) and 2 (b), under "Definitions," page 5, the sweeping nature of the bill in its relation to educational institutions and the agricultural experiment stations included, becomes fully apparent.

Digitized by Google

Many fundamental questions of States' rights and Federal-State relationships are involved. We think the bill should be clarified in this respect.

Dr. SCHIMMEL. What sort of questions are they?

Dr. ORTON. Dr. Buchanan, I am going to refer that to you.

Dr. BUCHANAN. I don't know why you say, "to formulate and promote projects and programs." We have already a well-developed technique for doing that type of thing. Suppose we talk of peacetimes at the moment. We will recognize without argument that there are emergency matters in wartime that transcend all of this discussion. But the formulation and promotion of projects and programs requires an amount of cooperation on the part of the State agencies that are involved in this case, and of educational institutions, and it practically says that in spite of the reaction on the part of the agency with which you are negotiating that it is possible, when necessary, to initiate and carry out such projects.

In other words, we feel that we need to emphasize the two-sided nature of the contract in such cases; that a directive in peacetime to an educational institution or to an agricultural experiment station, ought to be based upon approaching that institution and endeavoring to work out a satisfactory relationship. If there is refusal on the part of such institution to undertake such desirable or necessary work, there could, of course, be no possible objection on the part of that institution for some other agency to go ahead and initiate and carry out such projects.

We are genuinely interested in being sure, all along the line, that adequate use is made of the facilities which are at hand. I am sure that is in the minds of the drafters of the bill.

Dr. SCHIMMEL. If this were for the formulation and promotion through existing agencies of voluntary projects—that would fit in with your personal thought on the matter?

Dr. BUCHANAN Yes.

Dr. SCHIMMEL. And if this office were not able to get, shall we say, takers on these national projects which it formulated and tried to promote, and were given the power to carry out and initiate the project itself, that also would fit in with your thought in the matter?

Dr. BUCHANAN. Certainly; otherwise it would be a dog-in-the-manger attitude which we wouldn't be justified in taking at all.

Dr. ORTON. Point 7—section 4, item (c), page 9, line 3:

> To foster and develop scientific and technical methods, to promote their application in the national welfare, either within the office or by other auspices, public or private, and to promote and provide training and participation in science and in its application.

The land-grant colleges, and particularly the agricultural experiment stations, have been and are now engaged in promoting and providing training and participation in science and in its applications. It is believed that persons qualified to judge are in agreement that these institutions have achieved a distinguished record of accomplishment in these endeavors.

It is not clear what is meant by the broad language "to promote and provide training and participation in science," nor is it clear how such promotion and provision would supplement, compete with,

Digitized by Google

or displace the already operating and effective programs of these institutions.

Mr. COLLINS. Your feeling is that carrying out this power should not interfere with the existing programs as they are now in effect?

Dr. ORTON. That is right.

Senator JOHNSON. It is Mr. Collins' idea that most of the Federal funds going into research have been made available to agriculture. I think probably that is true, and you have worked out a very sensible, realistic program, and a very effective one. Now with that experience back of you would you say that research should also be carried out by the Government into industry and manufacturing and transportation and other fields of endeavor, based on your experience with governmental—both Federal and State—assistance and aid and direction?

Dr. ORTON. It would be a very interesting experiment. I don't know how successful it would be. This research in agriculture is something that started back in the early days and has developed to the point where everybody has accepted it. The farmers, and so on, take it almost for granted that this help is available to them.

For some reason that I don't know, industry developed its own research organizations, and it has been placed on an entirely different basis. Whether you could transform and bring them into line with our plan in agriculture isn't clear to me.

Senator JOHNSON. I think that is getting right at the very fundamentals of this bill. Governmental funds have accomplished great things in agriculture.

Dr. ORTON. Without a doubt.

Senator JOHNSON. Now this bill wouldn't, of course, take away any of those blessings. But whether or not that same sort of assistance should be given to other fields is the very point of this whole bill, it seems to me.

Dr. ORTON. Well, I might point out that this bill cuts across two great segments of research, the research of private industry and the research of a public nature, such as the experiment stations. Now it is that sort of a cleavage, you see, that interests us. We are on the public side of the thing and here is another whole group of research agencies over here, industry and so on, that are not carrying on their program in the same way that we carry on ours, with relation to the public. But the bill doesn't differentiate between the two.

Mr. COLLINS. I am sorry you could not have been here on Monday when a witness testified to the fact regarding industry that there are no research facilities available for 150,000 small businesses in this country. You have just said that there is hardly a farmer in the country who has not received, in some small part at least, the blessings of agricultural research, but nine-tenths of industry, numerically, has no place to go for research.

Senator JOHNSON. That is probably one of the reasons that small industries are disappearing; they are not able to maintain their progress through research, and they simply have to fold up. Probably the same thing would happen to agriculture if it were not for the research and assistance that has been given by this wise policy; agriculture would gradually drift into the hands of a few, and the

Digitized by Google

workers would either be serfs or they would be directed by large combinations.

Dr. ORTON. There is a very good reason, I expect, for the present relationships. After all, we are dealing here with research in agriculture, with a basic resource, the soil and its products, and from the standpoint of its products, the survival of our entire population.

These industries are all built on the foundation of these basic resources. Without these basic resources they couldn't exist. They are things that man develops.

Now it is essential, it seems to me, that the basic materials be supported as they have been supported. I think our forefathers who devised this agricultural research program had precisely that thing in mind; they wanted to set up a basic organization here from which the basic industries would benefit.

But when it gets into industry itself, industry is expected to carry on its own research. A thing that man develops himself he ought to be able to carry on.

Senator JOHNSON. When we think of industry we are too apt to think of the very large industries, but we have a great fear in Congress, and I think in the country, as to the future of small business and small industry. Small industry is having to fold up and disappear.

Now a farmer, even if he has but one acre of land, has at his disposal the same research advantages as the farmer farming 100,000 acres. That isn't true of industry at all.

Dr. BUCHANAN. I would like to make one observation. Of course our Department of Agriculture and our system of experiment stations are relatively old from the standpoint of research. The departments which have to do with labor, with commerce and similar departments are relatively young.

Might it be too much to hope that in connection with these departments there might be similar developments, or through some other agency, with facilities for doing the kind of things you suggest, that is actually servicing the smaller agencies which of themselves can't do the business?

You have put your finger on the nub of the matter when you say that the farmer himself is ordinarily handling a business that is too small to justify his own participation in research, but government steps in and has provided him with the facilities which he has come to trust and depend upon. Well, now, Government hasn't, apparently, done that kind of thing for small industry.

Dr. CORBETT. Might I suggest another difference that is bothering me and possibly the rest of the group; it was implied in Dr. Schimmel's question about transferring the fruits of what we have learned to other groups.

I think the essential thing that bothers us is that our development has been on a grants-in-aid basis with the initiation of the problems coming up from the farmer. You are proposing quite a different program for the help of industry. I think if you were to enact a law which would have the same policy and the same point of view, we could much better answer your question. There is quite a change, you see. We don't know how it would work on a centralized basis. Does that help to clear up the difficulty?

Digitized by Google

Senator JOHNSON. That is a very valuable illustration and it is fundamental to an understanding of the bill, whether this bill is starting in from the top, with directives, or whether you are going to provide a natural expansion from the bottom up.

Dr. CORBETT. That is what our experience has been, and we think it has been a very fruitful and successful experience. So we don't know how to answer your question because this is new and it is a different point of view.

Dr. BUCHANAN. While we are dealing in the agricultural experiment stations primarily with farmers and with agriculture directly, nevertheless inevitably our researches frequently lead into the field of business and sometimes of big business, because we are interested in the processing of agricultural products; we are interested in the packers, the small packers and the large packers; we are interested in those who use corn, the corn millers, and so on.

Senator JOHNSON. That is true in my State in regard to the cultivation of sugar beets.

Dr. BUCHANAN. Yes; that is an excellent illustration of exactly that thing. In other words, the experiment stations do get into contact with many businesses, and we find that in those particular groups there is frequently, even though the business is quite small, the tendency to bring the problem to the experiment station to help get the solution. There is some help being given to small business through our stations, in appropriate fields, but there still is—I think you are right—a large area in which small industry is not adequately served at the present time.

Dr. ORTON. Point 8 — section 4, paragraph (m), page 11, line 3:

> To make, amend, and rescind appropriate rules and regulations to carry out the purposes of this act and all the powers and duties vested in the office, which rules and regulations shall have the force and effect of law.

Because of the inclusive nature of the concept stated throughout S. 702, this paragraph would place almost unlimited power over all research, whether public or private, in the hands of the office, which means in the hands of the board of seven men. Since most believers in democracy feel that education should be the last of our Nation's activities to be centrally controlled, and since research is the fountainhead of progress in education and human knowledge, the exact effect of this provision should be known. The powers should be made specific rather than general and sweeping, we think. The many fine accomplishments in general education and research should be safeguarded and conserved.

It is believed that it is the intention of the authors of S. 702 to achieve these ends, but such cannot be assumed unless specifically stated in the law.

Senator JOHNSON. I think your point is very well taken. Of course I had nothing to do with the preparation of this bill, but it is my opinion that clause could never get through Congress at the present time.

Dr. ORTON. That is all I have, Mr. Chairman.

Dr. CORBETT. Are there any further questions you would like to ask Dr. Orton? If not, the third statement which is a summary statement, will be by Dr. Baver of North Carolina.

Digitized by Google

STATEMENT OF L. D. BAVER, DIRECTOR, AGRICULTURAL EXPERIMENT STATION, NORTH CAROLINA STATE COLLEGE, RALEIGH, N. C.

Dr. BAVER. In our summary statement, Senator, we have tried to boil down as follows all that Dr. Buchanan and Dr. Orton have said:

In view of (1) the long history and pioneering effort of agricultural research in the land-grant institutions, in cooperation with the United States Department of Agriculture; and (2) the success of the present well coordinated research program in agriculture, we would like to summarize several points relative to S. 702 which, as Dr. Buchanan has already mentioned, should not be construed either for or against the bill.

Point 1. In light of the examples that Dr. Orton has mentioned, it is obvious that there is need for more clarification and more specific language in the wording of the bill.

Point 2. Since apparently it is not the intent of S. 702 to disturb existing agricultural relationships between Federal and State agencies, there should be a specific clause in S. 702, to the effect that nothing in this act shall be construed to be in conflict with, or to nullify, any relationships, projects, and/or cooperative efforts between Federal and State agricultural agencies.

Point 3. We wish to call attention to the fact that the present coordination of agricultural research between the Federal Government and the States, as well as among the States themselves, is the outgrowth of years of experience in which the goal of both State and Federal agencies has been to foster research solely in the interests of the public. The success of these researches has resulted largely from freedom of individual initiative in a coordinated program. Moreover, research has been productive because of the nearness of the scientist to the problem.

Point 4. On the assumption that S. 702 contemplates centralization of all research activities and personnel, it is very questionable whether progress will result from any centralization of the educational facilities, particularly research, of the established institutions, which have been the backbone of our scientific developments to date. This is clearly evident from the fact that there are great variations in both regional and local conditions which of necessity make research requirements varied in order to serve the public most efficiently. Moreover, these agricultural research institutions must be concerned with fundamental as well as applied research, and they must also undertake operational studies to insure the maximum usage of the research information that they find out.

Dr. CORBETT. That completes our statement except to answer any questions.

Senator JOHNSON. Dr. Baver, in regard to the four points that you have just made, are the results of the research that you develop put to practical use in nearly every instance?

Dr. BAVER. The results are put to practical use, but not by everybody. You know that you don't get all farmers to do what they ought to do. But the results are put to practical use. You can always count on the better farmers of the State getting hold of developments immediately. As a matter of fact a lot of farmers like for

Digitized by Google

us to come out and use their farms as a demonstration so that they can get hold of it before anybody else, so that they can maybe get a year on their neighbor.

Senator JOHNSON. As a matter of fact you rather follow than lead in many instances? That is, a need for something develops on the farm—to combat some insect or to get away from certain diseases, or to improve the strain of some kind—that need is felt by the farmers before you ever undertake to consider it?

Dr. BAYER. Yes; in a large number of cases; but then also we try to lead. May I give a specific illustration of that in North Carolina?

Senator JOHNSON. Please do.

Dr. BAYER. Our farmers are sold on a certain grade of fertilizer which they buy in large tonnages, but which we feel, on the basis of our research, is not the most efficient fertilizer. Consequently we try to lead the farmers into the use of a more efficient fertilizer, and the good ones respond, and the poor ones come along as they see the good ones do it.

Senator JOHNSON. Thurman Arnold discussed here the other day the role of monopoly and the cornering of patents with respect to technological development. Has that type of industrial operation affected agriculture?

Dr. BUCHANAN. Decidedly. If I might make a suggestion, inevitably in the work of the agricultural experiment stations, as in the laboratories of land-grant colleges and all educational institutions, there are many new things developed which are patentable and many of them are patented. Now in many of the institutions there has been set up a public service type of corporation for handling these things, as we believe, to the best interests of the public. I believe that Dr. Orton stated in his testimony that there had been developed 28 of these, and others are in process of development at the present time.

These are set up in such fashion that a professor or a worker in the experiment station who discovers something will get approval for patenting, the ownership of the patent will be transferred to the foundation, and it will be administered there, we believe, in the best interests of the public.

In some cases—but by no means in all—there are considerable profits. Some of these foundations have accumulated profits of as much as millions of dollars. These are reinvested directly in research for the public good. In other words, these constitute public trust funds on the State level.

There has been a good deal of discussion as to the best possible use of these patents. In many cases the patents are simply thrown free to the use of the public as where it is obvious that the use would at once become automatic and widespread. In many cases nonexclusive licenses are issued. There are, however, some instances, in which it is believed to be in the best interests of the public that exclusive licenses be issued.

For example, perhaps there is the development of some particular kind of agricultural machine that is applicable to some operation in sugar beet raising in Colorado and has very little application elsewhere. Obviously you can't get a large number of manufacturers to engage in the production of a machine which would have only local application. In cases of that kind I think you would find that ex-

Digitized by Google

clusive licenses would be granted, in the belief that it is in the best interests of the public to have a patent actually in use, rather than have a patent which, because it is thrown open to everyone, would not be used by anyone. And you will find, I think, other examples of that type.

Does that answer your question?

Senator JOHNSON. Yes. It so happens that in Colorado at the present time the colleges are working with implement companies in developing labor-saving devices, and are going right along with them. Of course, the advantage will extend to agriculture and to the public, and yet there will be an advantage to the private implement company, too.

Now, I wonder if that method of patents and restraints applies also to improved strains of grains and livestock?

Dr. BUCHANAN. Under the patent laws at the present time, you will recall, it is possible to patent certain kinds of plants that are reproduced vegetatively, that is, not by seed. Nothing that is reproduced through seed can be patented.

A new rose could be patented because it can be propagated asexually, just as a new variety of apple can be patented. I believe that the law excludes potatoes, but there are two or three things that are specifically patentable.

I believe that good practice on the part of an institution that develops a new apple, for example, would be to see to it that something that is desirable really gets into the hands of the nurserymen on a sufficiently wide basis so that it will become immediately available. I can see no reason in the world why an exclusive patent for the use of a particular apple should be given to any nurseryman.

Senator JOHNSON. Of course, that is just one other fundamental difference between agriculture and industry, and it is a very significant and important point also.

Dr. SCHIMMEL. Would you say that the experience in agricultural research has shown that at least in that one field public funds can be spent with great advantage to both producers and consumers?

Dr. BUCHANAN. Certainly. In the Department of Agriculture and the experiment stations public funds have been spent to the advantage of both producer and consumer. I have already given the illustration of the advances that have been made in nutrition at the University of Wisconsin in the agricultural experiment station; and there is the work that is being done at Cornell University in the nutritional laboratory. Things of that kind are advantageous both to producer and to consumer.

Dr. SCHIMMEL. Would you say that the voluntary cooperation features of the bill with the funds provided would work in most instances except where you feel they might impair the activities of your own experiment stations?

Dr. BUCHANAN. I would say that to the extent that there is no interruption of operations; with organization, with facilities, which are already efficiently operating there is no point to interference at all. There are certain areas, I think, in which the grant-in-aid principle is implicit—I think in several places in the bill. It is entirely possible that that grant-in-aid principle would function advantageously there.

Digitized by Google

For example, suppose that in the operation of the experiment station we made some discovery that would enable us to manufacture more economically or profitably or satisfactorily some agricultural product into food, or suppose we found some better way of extracting soybean oil. A bottleneck in getting that thing into use might be the development of a satisfactory pilot plant. In some cases, obviously, one would go to industry and say, "Now, here is something"—in some cases we have industrial groups, that is, associations, made up of all of the individuals, all of the organizations in a particular industry—"that is significant to the industry; this ought to be tried out on a pilot plant scale; will you help us out?"

Sometimes that will happen. In other cases it very possibly might be best for the interest of the public that another approach be taken and that the control be kept in the State or in the Federal Government until it really was ready for release as a finished product. In other words, the grant-in-aid principle for things like pilot plants in my opinion might be advantageously used.

Dr. SCHIMMEL. You are well known as having done a significant work in developing rubber from agricultural products, about which you have testified before Senator Gillette's committee.

Did you find, in connection with the development of rubber from agricultural raw materials, the same interest on the part of private industry that they evidenced in the development of rubber from petroleum raw materials; or did you find that it would be necessary for the Federal Government to carry through on that?

Dr. BUCHANAN. I think some explanation would be in order there. Through the work of the institution at Ames, partly in the agricultural experiment station and also in the engineering experiment station in our department of chemistry—this isn't an exclusively agricultural experiment station matter—some leads were developed which we believed might make possible the utilization, not only through the alcohol but through other fermentative products, of corn for the production of rubber; 2–3 butylene glycol, for example, can be produced directly by fermentation of corn, and theoretically that should be convertible into butadiene.

Another process, of course, is the production of alcohol by fermentation, and the catalytic transformation of that into butadiene for the manufacture of rubber.

In our actual experience we would have been helped, I think, a good deal by sufficient funds to have gone ahead on a pilot-plant basis. In this particular case, however, through the development of the regional laboratory at Peoria, there was open a Federal device for handling that, and at a particular step in the process the thing was simply transferred to the Federal laboratory, and I think they have been carrying on a very excellent series of studies there.

Does that answer your question?

Dr. SCHIMMEL. It seems to me that there is a real difference, and I wondered whether you had actually observed such a difference in your experience? In the case of the petroleum raw material I believe I could name offhand five companies that have spent hundreds of thousands of dollars in developing rubber from that raw material, and very often they have been the companies that are concerned with taking that raw material out of the ground. For example, Standard Oil spent a great sum of money on that and the rubber companies them-

Digitized by Google

selves, through chance or their own personal interest, or through some agreement with Standard Oil and other oil companies, have been cooperating very closely in their research programs with the oil companies.

Dr. BUCHANAN. That is right.

Dr. SCHIMMEL. Do you feel that there is a monopolistic situation—of the type that was described by Thurman Arnold—which is such that for agriculture to get a break in research the Government must step in and provide the funds?

Dr. BUCHANAN. I think that is a good statement of the case. I think that in cases of this kind the only way to get development, at least sufficiently rapid development, is by Government participation.

Now as to the origin of the funds, whether they should be State or Federal, or as a grant-in-aid or a special appropriation, whether it should be done in one laboratory or another, that is quite a different proposition. But the general principle, I think, is valid, that there are certain areas in which there will be no development, sufficiently rapid at least, unless there is direct governmental participation through the pilot-plant stage to the proof of the adequacy of the invention.

Senator JOHNSON. Of course, the Government furnishes the money in both instances. Industry simply takes it out of their income tax.

Dr. SCHIMMEL. During a war period certainly.

Senator JOHNSON. During peace periods or any other periods.

Dr. BUCHANAN. That is, it is counted as part of the expenses of operations; that is right.

Senator JOHNSON. Yes; and it is not subject to income taxes.

Dr. BUCHANAN. No.

Senator JOHNSON. So the Government is doing most of the financing in any case.

Dr. SCHIMMEL. But is not directing the investigation.

Senator JOHNSON. No; in the one case industry owns what is developed and in the other case it belongs to the public.

Mr. COLLINS. Was hybrid corn developed through the work of the experiment stations?

Dr. BUCHANAN. The work that led to the development of hybrid corn was done at the New Haven, Conn., experiment station.

Mr. COLLINS. Is it true that a great deal of the experimental work in that was done by private farmers?

Dr. BUCHANAN. No. The initial development of hybrid corn was made almost entirely by the experiment stations and the Federal Government, up to the point of realization of its economic value. Since that time many private firms have taken it on and are doing excellent work, but the initiative was with the experiment station.

Dr. ORTON. The principles were all worked out by the experiment stations.

Mr. COLLINS. In other words, the development was done by the experiment stations but it did not hamper the commercial exploitation of this new development by a great many different commercial firms and farmers and so on?

Dr. ORTON. That is right.

Dr. BUCHANAN. May I make one other observation in that connection? It is quite important, we feel—even though private industry at present can go ahead with the program on a satisfactory basis—

Digitized by Google

that the experiment station keep a finger in the pie. In my own State, for example, there are five or six large concerns that produce the hybrid corn planted on perhaps 50 percent of the acreage in Iowa. In addition there are four or five hundred small farmers who have taken up corn breeding and who get their stock material regularly from the college. I think that the participation of this group of four or five hundred smaller growers—they pay for what they get, it isn't given to them in any sense—and the continuation of the experiment station in this field quite prevents the development of anything in the direction of a monopoly in seed corn.

Dr. GUTERMAN. The point that Dr. Buchanan made about the experiment station keeping its finger in the pie is, I think, important. In the case of our own State, for example, we have developed a double-crossed hybrid silage corn which has increased the production of silage on the farm by approximately 25 percent.

Now we maintain at the station the parent seed stocks, or the four inbreds from which this double-cross corn is obtained. By having control of those four inbreds, at any time we get a new strain of double-crossed corn which is better than 29–3, we can take 29–3 right off the market and substitute the new one. Now if the inbreds were allowed to be grown and produced by seedsmen over the State, when we got a new corn that was better than 29–3 it would be impossible to get the other one off the market. And for that reason, I think it is important that the station operate in that way.

Mr. COLLINS. What percentage of the personnel of the stations has been lost to the military services or to war industries?

Dr. BUCHANAN. I am going to ask you to remember that in an institution that is conducting both research and education, there are individuals employed on different bases. For example, I suspect in every institution there are individuals employed on a fellowship basis, which means that they spend some of their time in the work of the institution and have a good deal of freedom for continuing other work. They are not full-time employees. We have assistants and graduate assistants, and so on, who are on that basis.

If you count all individuals we have lost, I suspect, perhaps a third—would that be reasonable, Dr. Secrest?

Dr. SECREST. A little high.

Dr. ORTON. About 20 percent in our institution.

Dr. BUCHANAN. I think it would be about 25 percent of the total personnel, but not 25 percent of the full-time workers. We have been able to retain the key men reasonably well, but of course the younger men have been called into all sorts of services, and should be.

Mr. COLLINS. What percent of the employed time, would you say, you have lost on a Nation-wide average?

Dr. BUCHANAN. I would guess 10 to 15 percent. But that is purely a guess.

Mr. COLLINS. Have you been able to make replacements of those in any way?

Dr. BUCHANAN. Yes. In Iowa the situation is that in particular fields student enrollment has gone down. That has been true in agriculture, because there has been no deferment of any kind. Men who are in the Reserves and are in agriculture are called to the service. If

Digitized by Google

they were in physics or in chemistry, there would be the insistence that they remain in the institution until they had completed their work. So that the loss of students isn't uniform at all in the various fields.

It happens in our institution that the number of students dropping out for these various services has been great in agriculture and elsewhere. In many cases individuals are employed part of their time in research and part in teaching. We have been able to compensate reasonably well by taking over the full time of those who otherwise would be teaching part time.

Mr. COLLINS. What do you suppose, in employed time, is the net loss due to the war effort of those employed in research stations?

Dr. BUCHANAN. From the standpoint of what is actually being done in Iowa, I would say it is nothing. I mean that at the present time, I think the amount of work being turned out is equal to the amount done in peacetime, because we have had these compensations. I think that the case of the agricultural experiment stations is somewhat different from what you will find in most instances. I know that in the engineering experiment station of the college at least two-thirds of the personnel, of the total time, has gone completely.

Mr. COLLINS. You feel you haven't suffered any net loss?

Dr. BUCHANAN. I am speaking for Iowa, and I think that is true.

Mr. COLLINS. Does that check with the experience throughout the country?

Dr. GUTERMAN. I think at our institution that would not be true, because under our system we use in connection with our work a large number of what we term "graduate-student assistants." We have a permanent member of the staff and we supply him with two or three or four of these graduate-student assistants. Now we have lost large numbers of those younger men.

Mr. COLLINS. What percentage would you say you had lost?

Dr. GUTERMAN. I wouldn't want to say. I can give you an example. In our department of entomology, for example, since the 1st of January, they have lost 50 graduate-student assistants. Now that isn't quite as bad as it sounds, because when we lose a man, when he is drafted or volunteers, we try to get another one. But I do think that at least as far as my institution is concerned, we are unable to do certain items of research which we would like to be doing, due to the lack of help in this category.

Dr. CORBETT. I wonder if this illustration would help? The Maryland station has approximately 125 people above what we call the graduate student or assistant level. Out of that whole group that are on the pay roll, I don't believe there are 5 that are on full time. The rest of the time they are spending in the teaching classroom, and some do some extension work. The Senator knows, of course, about agriculture extension work. What we have done, as we have lost personnel, is just as Dr. Buchanan has indicated. We have shifted the people over from the teaching staff onto the station, and the net loss in activity is virtually nothing.

Mr. COLLINS. Is that true in your case, Dr. Baver?

Dr. BAVER. Just about. We have had to stop none of our projects. Some of us are working longer hours.

Mr. COLLINS. What is your experience in West Virginia?

Digitized by Google

Dr. ORTON. I would say we have fallen behind in West Virginia. We have two or three replacements of important personnel that we have been unable to make. It might be not over 5 percent, perhaps.

There is this other point, that in this transfer that we are making there is some lost motion. It is pretty difficult to say just how much. You ask a man to go in and take a position who is inexperienced in this particular line, perhaps, and yet has had background that enables him to do the work. He can't step into the position of the man that has gone out, an experienced man, and make the same headway that the other man made. There is a period of adjustment that slows him down.

Senator JOHNSON. You have a loss of results without a loss of personnel?

Dr. ORTON. That is right.

Dr. BUCHANAN. I think it should be emphasized that probably there never has been dumped into the laps of the men in the experiment stations more new and difficult problems than are being dumped at the present time. When we say that we are keeping up reasonably well in turning out results, I think that we should say also that we could use, perhaps, double the personnel that we have available at the present time. So that we wouldn't want to say at all that we are adequately performing the task.

Mr. COLLINS. Would you say that as a scientist you could see in this bill the possibility that scientists in general might be given a greater opportunity to contribute to the war effort?

Dr. BUCHANAN. I mentioned a moment ago that when we run into a problem such as pilot plant operation, where a specific grant-in-aid would enable us to do some particular thing, it might be exceedingly helpful. I think I could find a good many illustrations of that kind of thing. I don't know whether or not there should be, except for special things of that kind, an agency giving general grants-in-aid. That is, if I can't get enough money out of my legislature and Congress doesn't appropriate enough money to the Department of Agriculture, here is another agency to which we could turn in an emergency—and I am not sure that that is quite in the interests of good government to have too many alternatives of that kind. But certainly in certain particular kinds of circumstances, the grant-in-aid principle that is involved in the bill would be helpful.

Mr. COLLINS. It might enable the development of the farm chemurgical developments to a greater extent?

Dr. BUCHANAN. The farm chemurgical developments simply mean the utilization of techniques for the manufacture or new utilization of agricultural products. Now Congress has already established four large regional laboratories primarily for carrying on that work. We have in the experiment stations throughout the country a great deal of work of that kind going on. I don't know that I would want in any way to separate farm chemurgy from the normal operations of our experiment stations as something apart and different from what we have been doing all the time, and which we are increasingly enabled to do through the support that is coming to us from ordinary sources. But this pilot plant development would be exactly in line with what you are saying. It would be, shall we say, a chemurgy kind of a proposition.

Digitized by Google

Senator JOHNSON. But of course, you are watching the chemurgical development and are ready to take advantage and use and apply it?

Dr. BUCHANAN. May I say, Senator, I would turn the thing clear around, and say instead of watching it we are leading it.

Senator JOHNSON. I wish you would expand on that just a little, if you don't mind. What I meant was, the Congress set up these four plants that you have mentioned. Now you are watching the develoment in those plants?

Dr. BUCHANAN. That is right and in some cases we are feeding into those plants the things that originate with us.

Senator JOHNSON. That is what I want to know about.

Dr. BUCHANAN. Well, I mentioned a moment ago the development of 2-3 butylene glycol as a fermentative product which is being developed now by the regional laboratory at Peoria. Some years ago, 10 years or more ago, it was observed at the University of Wisconsin that one type of corn contained a starch different from the ordinary type. It had been brought in, as far as we know, from some place in China, apparently a sport of some kind.

When you put iodine on the starch of ordinary corn, it turns blue; when you put idodine on the starch of this particular corn, it turns a reddish purple. When you boil up the starch from the different kinds of corn, they have different properties. It became evident that when you boil the starch from the so-called waxy corn you get a gummy solution. If you do the same thing with ordinary corn starch and let it stand, it sets into a firm jelly. The characteristics of the waxy corn are quite exactly like those of tapioca.

There seemed to be the possibility here of developing a type of corn which would replace tapioca. At the Iowa station our chemists and corn breeders made a blueprint of what they wanted to do. They took the type of corn which yielded very few bushels to the acre and which had many defects; they crossed it with the inbreds which are used in some of our better hybrid corns, and developed a series of inbreds, crossed those, and we now have a hybrid waxy type corn.

That was done, shall be say, as an interesting stunt, and with the hope that it would prove of some practical value. Now our tapioca supplies are cut off. The United States normally imported about 350,000,000 pounds of tapioca.

Perhaps 125,000,000 pounds were used for purposes for which tapioca is superior to ordinary cornstarch. The other 200,000,000 pounds or so were used simply because it was cheaper.

Now here is a market at the present time for 125,000,000 pounds of this particular kind of cornstarch. The stamps on our envelopes and our gummed labels, and so on, are made from tapioca starch. Well, we have something to replace that at the present time. And the regional laboratory has been cooperating very actively in the development of the replacement uses of this waxy corn. This next year all of the seed that we have been able to produce is going to be used, about 3,000 or 4,000 acres of this waxy corn is being grown and we have been asked to produce enough seed to plant about 60,000 acres next year to supply that particular emergency need.

Now there, I think, is a case in which the regional laboratory and an experiment station have cooperated well in a development.

Is that the kind of thing you had in mind?

Digitized by Google

Senator JOHNSON. Yes; that is what I was interested in knowing, some practical way in which they were working together, and especially that the experiment stations were leading the four regional stations.

Dr. BUCHANAN. Suppose we say "partnership" rather than that. The initiative is in both places. In other words, neither the experiment stations nor the regional laboratories have a monopoly on scientific brains, and I think both agencies will make contributions.

Senator JOHNSON. But you are watching the research work developed by them very closely and applying it wherever possible?

Dr. BUCHANAN. That is right. Of course, the regional laboratories are just getting into full operation, they have had difficulties in priorities, and so on. I think they are fully going concerns and are doing an excellent job at the present time.

Senator JOHNSON. To clarify what I was getting at a little better, what would have happened to the development of waxy corn without these four pilot stations?

Dr. BUCHANAN. It probably would have meant that we would have had to put more money into it ourselves. In this particular case, industry itself was so interested that undoubtedly we could have gotten grants-in-aid directly from industry for doing the thing.

Actually, I think that it is on a much better basis for having had the cooperation of the Federal laboratory rather than having had the whole thing handled through grants-in-aid from industry.

Dr. ORTON. There is another point about this relationship that might be of interest, and that is that each of these Federal laboratories has an advisory committee made up of directors of the experiment stations within that region, and we meet once or twice a year with them and go over their programs.

Senator JOHNSON. That is very interesting and very important.

Dr. ORTON. It is working out very well, we think.

Senator JOHNSON. Dr. Corbett had an observation he wanted to make awhile ago, and he was very rudely interrupted by me. I apologize to him.

Dr. CORBETT. Not at all.

You asked about the chemurgic development. I think there is a bill in the House, H. R. 701, which is an attempt to further develop the chemurgic idea through the experiment sations. I think that Congressman Andresen introduced the bill, and the Chemurgic Council and the editor of the Farm Journal are the individuals who are really back of it, I believe.

Possibly the Senator would also be interested in noripol, which is one of the most interesting developments in rubber, I think, that we have in the country. That, I am quite certain, was developed at one of the experiment stations, and then taken on by the regional laboratory. It is an excellent substitute for rubber in many cases.

Dr. SCHIMMEL. I would just like to recall a bit of testimony that we had last December when Colonel Sanders, of the Selective Service, appeared before this subcommittee and strongly supported the bill; and on being asked for an illustration as to how it could be effective, he said he thought it would be most effective in agriculture, and he admitted that there was a great deal of agricultural research now going on, but he said that the agricultural people, due to lack of an over-all

Digitized by Google

viewpoint which would come from an agency which would be familiar with agriculture, industry, commerce, and transportation, and so forth, were neglecting the possibilities of labor saving through this industrial engineering technique we discussed before.

And Colonel Sanders estimated, as a matter of fact, that you could probably increase the efficiency of labor some 50 percent, and mitigate the present labor shortage in agriculture. He felt—and I was wondering what your opinion would be—that agriculture would be very glad to engage in such a program, but he doubted whether either the local experiment stations, the Extention Service, or even the Department of Agriculture itself would exercise sufficient initiative on this type of new research work, where he felt an over-all agency would exercise that initiative and the agricultural research groups would be glad to undertake the project once it was formulated.

Now I think it would be very interesting to have your comments with respect to this earlier testimony, which I hope I have represented accurately.

Dr. GUTERMAN. What kind of research are you thinking about specifically, these time studies and that sort of thing?

Dr. SCHIMMEL. Yes; some of which is already going on in a small way now.

Dr. GUTERMAN. We have already started some at our institution.

Dr. BAVER. We studied Colonel Sanders' testimony. Our general comments on his testimony is that it is rather confusing and does not provide the basis for the development of a sound plan to utilize effectively the resources of the farmer.

Dr. SCHIMMEL. I was thinking of the research aspect of it.

Dr. BAVER. I have a complete analysis of his testimony as it applies to North Carolina.

Mr. COLLINS. Is it in relation to this bill?

Dr. BAVER. In regard to his idea on farm labor.

Mr. COLLINS. Would you care to submit that for the record?

Dr. BAVER. No; I don't believe so.

(Discussion off the record.)

Dr. CORBETT. Senator, we would like to thank you for this very understanding hearing. I think I can speak for the group and say that every one of us is convinced that you have a sympathetic and real understanding of agriculture, and we appreciate it.

Senator JOHNSON. The committee wants to thank you.

I would like to explain to you gentlemen that as this is Saturday afternoon a great many of the Senators are out of town and Senator Kilgore, the chairman of this subcommittee, was also called away and couldn't be here.

However, we wanted this record for their benefit, that they may review it, and we want to assure you that it will be very carefully studied by a great many men.

Thank you very much.

Dr. CORBETT. Thank, you, Senator.

Senator JOHNSON. Prof. Harry P. Hammond, dean of engineering, Pennsylvania State College.

We are glad to have you here, Professor Hammond. I have some questions that I would like to ask, and receive your answers for the record.

Digitized by Google

STATEMENT OF HARRY P. HAMMOND, DEAN OF ENGINEERING, PENNSYLVANIA STATE COLLEGE

Senator JOHNSON. First, how can an inclusive Federal research organization secure the maximum benefits during the emergency through the facilities of the engineering schools?

Dean HAMMOND. I would answer that in this way, Senator, that I think the engineering schools of the country, by and large, should have the benefits of Federal support in somewhat the same way that the agricultural schools have had such benefits.

I hadn't intended to say this, but I will go on and say that for a period of 35 years the engineering schools have endeavored to establish somewhat the same sort of relationship with the Federal Government that the agricultural experiment stations have had. We have met with frustration—I think that is the right word—all along the line, partly due to the fact that in engineering there isn't any one group of colleges to represent the interests of research as the land-grant colleges represent the interests of agricultural research.

Now only recently have the engineering colleges of the country made common cause on this, and said there isn't any line of demarcation between the land-grant schools and the non-land-grant schools. The University of Michigan is just as much interested in research as Michigan State College, and the Colorado School of Mines is just as much interested in research as Colorado State College, and so on. So there has been established a central representative association, and we are hopeful that through that there may be established a working relationship between engineering schools and their experiment units, on the one hand, and the Federal Government, on the other.

Now I represent—not here today—but I happen to be a member and chairman of the committee on engineering experiment stations of the Association of Land Grant Colleges, and knew of such legislation from the early days of its proposal; that is, I appeared and testified before Mr. Maverick, and so I felt a responsibility to keep my committee informed about it; I am just saying this to explain my presence here.

I will now answer your question specifically. This bill, it seems to me, provides a number of very admirable features, but I think it ought to be scrutinized from the standpoint of, perhaps, the most unfavorable way in which it could be operated. I mean by that that it ought to be scrutinized from the standpoint of a small caliber bureaucrat being put in charge of the agency it creates as administrator of that agency. It seems to me, reading the bill fairly carefully, that there is a definite danger that the result that I think the sponsors of the bill want might not be realized. You put your finger on, for example, what I thought was the most dangerous clause, this one that gives the administrator——

Senator JOHNSON (interposing). That is page 11.

Dean HAMMOND. Clause 4 (m). That gives the administrator the authority—

To make, amend, and rescind appropriate rules and regulations to carry out the purposes of this Act * * * which rules and regulations shall have the force and effect of law.

Digitized by Google

That is the most dangerous provision of the bill, but I think there are others also that, under the type of administration which the colleges of the country have come to fear, might take place.

Senator JOHNSON. Of course, the Congress at the present time would never enact section (m); there isn't the slightest bit of danger that any such provision would be enacted into law at the present time. That was a customary practice a few years ago, but thank God it is no longer.

Mr. COLLINS. Could you develop at that point your feeling about the method of how an inclusive Federal research organization would or should or could secure the maximum benefits?

Dean HAMMOND. Yes. I think it could support, develop, and guide, but not direct research organizations. That is, I don't think that research is likely to prosper under direction.

Mr. COLLINS. You mean in the sense of giving orders from a central place as to whether you should drop "A" and do "B"?

Dean HAMMOND. That is right.

Senator JOHNSON. Do you like the pattern of the lang-grant-college formula?

Dean HAMMOND. You mean the agricultural experiment stations?

Senator JOHNSON. Yes; the agricultural experiment stations; do you like the pattern of that research development?

Dean HAMMOND. Yes; quite well. It has done a magnificent job, by the way.

Senator JOHNSON. I concur with you fully in that, but I mean how would that approach satisfy you insofar as engineering is concerned?

Dean HAMMOND. Very well.

Senator JOHNSON. That same approach?

Dean HAMMOND. Yes.

Now may I say this, that there is a difference that was brought out here this afternoon between engineering in relation to these problems and agriculture, and the chief thing that we have got to safeguard, so far as engineering is concerned, is the interest of the public. There is no other disinterested agency of research in this connection except these engineering colleges. The emphasis must be on the establishment of a research organization for the benefit of small industry; that is important. A few years ago I was connected with a study of this sort of thing in New York City, chiefly with respect to education, but research was a factor in it, we found that more than half of the industries in New York City has fewer than 10 employees. That didn't include the service industries, but only those that produced something. Over 80 percent of all the people employed in industries in New York City were employed by those who had fewer than 25 employees.

That is astounding; at least, it was to me.

Senator JOHNSON. Particularly, too, when you remember the war effort is being carried by the big industries; I am not certain of this percentage, but as I understand it, to the extent of more than 90 percent.

Dean HAMMOND. Of course, you have to discount what I have said somewhat, because a lot of those industries are millinery establishments, dress manufacturers, and so forth, but a lot of them aren't; a lot of them are little machine shops, and establishments like that.

Digitized by Google

What I am getting at is this: In only one State that I know of is there an organized effort to aid small industries through engineering research, that is in New Hampshire. All the rest of us can do jobs piecemeal for the big industries when they hire us to do them.

Mr. COLLINS. You feel that that would be one of the things that a bill such as this should concentrate on doing?

Dean HAMMOND. I put the interests of the public first, because there isn't any disinterested research group in existence now, so far as I know, except the colleges and a few such laboratories as the Mellon Institute. The industrial laboratories produce a good many things that are in the public interest and a great many of them—and they shouldn't be discounted—employ men like Irving Langmuir, who has done as much for the public, although he was an employee of the General Electric Co., as he would if he had been with a college. But by and large, these laboratories work for their companies; they don't work for the benefit of the public at large, directly, the way the agricultural experiment stations do.

Senator JOHNSON. That is an important point.

Now what specific problems do you face in your college regarding the mobilization of your engineering research facilities for the war?

Dean HAMMOND. First, our financial support is such that we can't maintain a strong central organization. We live too much from hand to mouth; that is, we earn most of our income by conducting research for industries or associations or societies. We get some of it from the State of Pennsylvania, of course, but it isn't sufficient to keep in existence a strong central organization.

Second, we are losing too many people to the armed services and to war industries. We lose our best men.

I was surprised that these gentlemen a few minutes ago didn't bring out the point that the men they lose are the most valuable ones.

Mr. COLLINS. That is the case with your people?

Dean HAMMOND. They are the ones that we lose. It isn't the older men, it isn't the divisional heads, but it is the young, brilliant fellows that the industry spots and says, "We will give you $6,000 a year," and he leaves. And incidentally, the Federal departments are the worst pirates there are on that, Senator.

Senator JOHNSON. I think they are to be excused, because they have the burden of carrying on the war.

Dean HAMMOND. Well, I don't want to keep you, but I couldn't quite agree to that, because when you say the "Federal departments," you usually mean some minor employee of the Federal department who doesn't see the whole picture.

Senator JOHNSON. To expand this second question somewhat, is it your opinion, then, that there is a distinct loss to the war effort in the failure to take full advantage of the engineering research facilities of the colleges?

Dean HAMMOND. Yes; I know it. I could cite cases of State after State, one by one, where the research facilities of the colleges aren't being used as they ought to be.

Senator JOHNSON. Turn to page 8, section 4, paragraph (a), line 19. How important do you think this is, and have you any suggestions on how it might be carried out?

Digitized by Google

Dean HAMMOND. Yes; I think it is quite important. I think it ought to be done systematically and periodically, but without burdening the colleges with very long and elaborate questionnaires. We have too many of them already, and it ought to be a fairly simple form of statement that we can make out quickly.

Senator JOHNSON. Can you give any specific example regarding questionnaires?

Dean HAMMOND. Well, we answered three within one week on the same subject, with relation to engineering research facilities, from different agencies.

(Discussion off the record.)

Senator JOHNSON. Now our fourth question: I believe you have some comment on section 7, paragraph (f); that will be found on page 18.

Dean HAMMOND. That is the same thing that I have spoken of before—

> The Administrator is hereby authorized and directed (1) to prescribe and promulgate appropriate rules and regulations which shall thereupon have the force and effect of law.

That is with reference to patents, and I think the same objection holds on that as to the other section that was mentioned.

Senator JOHNSON. Can you discuss how coordination of research activity might well be carried out both on a local and on a national basis?

Dean HAMMOND. Well, I believe it could best be done under the establishment of a regional organization which would know the problems of the district and the facilities of the institutions in it and then be able to bring the two together, instead of having the entire organization carried out from one central office.

Senator JOHNSON. You have no fear of regional governmental units?

Dean HAMMOND. Not if the whole bill is scrutinized with the danger in mind that I have already mentioned.

Senator JOHNSON. What percentage of your facilities now in use are in war work?

Dean HAMMOND. All of them, all of our research facilities.

Senator JOHNSON. And what percentage of them are idle?

Dean HAMMOND. That depends on what you mean by "idle." If you mean their potential usefulness, I would say that we could easily double or treble our research output for the war.

Mr. COLLINS. What are the bottlenecks that prevent that at the moment?

Dean HAMMOND. Manpower and funds, both.

Senator JOHNSON. And you have no facilities that are engaged in nonwar work?

Dean HAMMOND. We have none at present.

Senator JOHNSON. What problems have you encountered in retaining scientific and technical personnel for war work, other than you have already mentioned?

Dean HAMMOND. Well, it is the competition between agencies that is so undesirable. May I illustrate that?

Senator JOHNSON. Yes.

Digitized by Google

Dean HAMMOND. Just at present there is a severe need for sanitary engineering and sanitary engineering research with reference to housing and camp sites, and almost all of the sanitary engineers of the country have been swept into the Army.

The best man we had to conduct sanitary engineering instruction and research—he was a young man—went recently to a 75-percent increase in salary, way beyond what he ought to be getting. We were forced by his loss to stop completely in that field. We just closed the laboratory, locked the door, and put the key in our pocket. The man who did that to us was a former college man, and it is the former college man who is now in some Federal department that is the worst enemy we have, because he knows our jobs, he is familiar with our men. He has a job to do and he takes a man who is doing something very useful and puts him into doing something less than half as useful.

Our former staff man is now organizing short courses for camp sewage treatment plant operators, which is a thing that a subordinate could do, a man with half his capacity.

That illustrates the whole thing as to just what is happening all along the line.

Senator JOHNSON. Do you suppose that they have something more important in mind for him later on, and simply want to bring him into the organization to have him on tap?

Dean HAMMOND. No; so far as I know they just want him to do that thing.

Now I wouldn't want to be understood as being selfish about our good personnel. We have made some of our very able young men available to such divisions of the service as the Signal Corps, because they are eminently qualified to do a particular thing—sound detection work, for example, and ultra high-frequency work.

We had a chap who could do that better than anybody else, and the Signal Corps asked for him, and we said, "Certainly, he would be more valuable with you than he is with us."

But that is the exception rather than the rule. What I am describing has gone on all over the country, not just at Pennsylvania State, until our best research men are out of the colleges and somewhere in Federal employment.

Mr. COLLINS. Is it a fair statement of your feeling to say that you believe your group is in need of assistance?

Dean HAMMOND. I could say it still more broadly than that; that in general this bill offers the possibility of great assistance to the engineering college experimental units of the country, but that it ought to be scrutinized very carefully from the standpoint of unfavorable conditions of operation. In other words, if it is placed in the hands of somebody who hasn't the breadth of vision or the unselfish attitude to carry it out as it is intended to be carried out.

Mr. COLLINS. What type of a man do you think the administrator ought to be?

Dean HAMMOND. Well, I can answer that question in terms of a man that I know of, but O. P. R. D. has him.

In the hands of a petty bureaucrat, this bill embodies a lot of danger.

Digitized by Google

Senator JOHNSON. Vice President Garner used to say that a poor law with a good administrator is much better than a good law with a poor administrator.

Dean HAMMOND. That is right.

I am weighing my words when I say that this has dangers of a severe sort for the good of research in this country.

Mr. COLLINS. You also think that it contains potentialities for good?

Dean HAMMOND. It does, definitely.

Senator JOHNSON. Thank you very much, Dr. Hammond. It has been very kind of you to come here and give us the benefit of your views on this bill.

Dean HAMMOND. Thank you, Senator.

(Whereupon, at 5:15 p. m., the committee recessed, subject to the call of the chairman.)

SCIENTIFIC AND TECHNICAL MOBILIZATION

FRIDAY, APRIL 9, 1943

UNITED STATES SENATE,
SUBCOMMITTEE ON SCIENTIFIC AND TECHNICAL MOBILIZATION
OF THE COMMITTEE ON MILITARY AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to call, at 10:30 a. m., in room 104–B, Senate Office Building, Senator Harley M. Kilgore (chairman) presiding.

Present: Senator Kilgore (chairman).

Also present: Henry H. Collins, Jr., and Herbert Schimmel, of the committee staff.

Senator KILGORE. The subcommittee will come to order.

The hearings on S. 702 will be resumed.

The first witness is Mr. Clyde Ellis, executive manager, National Rural Electric Cooperative Association.

Mr. Ellis, will you please come forward, hold up your hand, and be sworn as a witness?

(Mr. Ellis was duly sworn as a witness by Senator Kilgore.)

Senator KILGORE. Mr. Ellis, I believe you have a prepared statement. I would appreciate it if you would go right ahead with your testimony, pausing for comment at any place you may care to, and I may ask questions as you go along.

STATEMENT OF CLYDE ELLIS, EXECUTIVE MANAGER, NATIONAL RURAL ELECTRIC COOPERATIVE ASSOCIATION

Mr. ELLIS. My interest in the matters covered by the science mobilization bill, S. 702, is not new. For several years I have discussed the inequities of our technological situation in speeches on the floor of the House of Representatives, when I was a Member of Congress, and in speeches elsewhere. I have over and over again expressed particular fear and apprehension with regard to our patent set-up. It is well known that through a vicious system of cartels and other monopolistic practices many technical devices have been denied to the people of America. In an effort to get to the core of this matter, I sought and was given a place on the Patents Committee of the House of Representatives.

My present position is executive manager of the National Rural Electrical Cooperative Association. This nonprofit organization brings together consumers of rural electric cooperatives, public power and public utility districts of the country. These projects operate in 45 States and serve well over a million farm homes. The purposes

Digitized by Google

of the association are set out in its articles of incorporation. I quote from this document [reading]:

The purposes of this association shall be—

1. To assist the utilization of rural electric cooperatives for the most effective prosecution of the war effort of the United States of America, and to assist such cooperatives with respect to their common problems in the post-war period; and

2. To engage in the compilation and dissemination of information with respect to rural electrification and the furnishing of other services to rural electric cooperatives and others in connection with the coordination, advancement, and development of rural electrification in the United States of America, its territories and possessions, for the primary and mutual benefit of the patrons of the association and their patrons as ultimate consumers.

Since the incorporation of the association on March 20, 1942, it has struggled for its existence against the power combine, the most powerful and most complete monopoly in America. Every attempt has been made to break the back of this association. Every kind of derogatory charge has been flung at us.

Senator KILGORE. Let me say something there, Mr. Ellis.

Recently I had the pleasure of talking with a man who was from South America, and the thing that had impressed him during an extensive trip over the United States was the widespread use of electricity and running water. That to him was the outstanding example of American progressiveness—the fact that the farmer had electric power on his farm and that most of the people had running water in their homes. He did not look at the air lines or the new scientific inventions; but those two things appealed to him tremendously, as his idea was that the progressiveness of a nation is gaged by the conveniences of the common citizens rather than by the few top developments.

Mr. ELLIS. That is right.

Senator KILGORE. The spreading of services to the common man was what impressed him.

Mr. ELLIS. Because the world over you will find that the farmer is in a peonage status.

Senator KILGORE. Mr. Ellis, don't you think that that is the basic difficulty in getting manpower on the American farm right now—the fact that the farm is looked upon as being backward and not doing a progressive job?

Mr. ELLIS. That is right. The rural electric cooperatives, which I represent here, in the past 8 years have furnished electricity to some 29 percent of the American farm homes. In the period until 7 years ago, private power companies had gotten electricity to only 10 percent of the farm homes in the country, and 60 percent are still unelectrified. Of course, we got started too late.

Senator KILGORE. Go ahead.

Mr. ELLIS. As I said, every kind of charge has been flung at us. Yet our association has grown by leaps and bounds because we are right. We are feared because we are constitutionally opposed to the undemocratic practices of those who control the electric power monopoly—because we believe in free competitive enterprise.

It is a well-known fact that all of the private power companies in this country operate as one company. They have a national association known as the Edison Electric Institute. A chart showing the corporate relations of these companies was compiled by the Federal

Digitized by Google

Power Commission in 1935. I have it here [exhibiting large chart], and this is the latest of such charts.

Now you can see at a glance that practically all of the power companies of any importance in this Nation head up, in one way or another, through the Electric Bond & Share Holding Co. Its arms reach out into these others, either through the Edison Electric Institute, or through the holding companies and the combines that go on within them. The Power Trust of this Nation operates as one huge monopoly.

Senator KILGORE. Isn't that the basis for the terrific fight that was put up to protect the holding companies?

Mr. ELLIS. Right, sir; and it is still going on, in many, many quarters, and here in Washington.

Of course, the Electric Bond & Share Co. is tied in with the House of Morgan, and Morgan interests and holdings are in many of the other companies.

Senator KILGORE. May we have a copy of that chart?

Mr. ELLIS. You may have this one, sir.

Senator KILGORE. Thank you.

(The chart was marked "Exhibit No. 7" and filed with the committee.)

Mr. ELLIS. I may add that the Securities and Exchange Commission has later data showing more and more of these connections, but this is all that was known in 1935.

Mr. COLLINS. In the intervening 7 years, has there been a concentration or a distribution of control?

Mr. ELLIS. There has been a concentration of control except for the operation of the Securities and Exchange Commission under the Utilities Holding Company Act.

Now, some of these connections have been very lately severed. However, it would not affect this chart to any great extent. The Securities and Exchange Commission has ordered the Public Service properties in Colorado to be sold, because they are not a part of an integrated system; they just operate there in a given area. Those properties would not show on here because of the connections with the Cities Service Co., which owns Public Service.

This chart also will reflect many other interesting details of how any one of the smaller companies might owe its allegiance to several of the large companies, so they are tied in at the bottom of the system as well as at the top.

It is also well known that these American companies have been interlocked with the German, Italian, and other power trusts through their officials and their holdings.

Senator KILGORE. Wait a minute. Do you mean to say, Mr. Ellis, that American companies are actually connected with German and Italian companies?

Mr. ELLIS. Yes, Senator, I say that officials of these companies are, many times, interested in, and are officers in, the foreign companies.

Senator KILGORE. You mean officials of American companies have interests in foreign companies which would cause an interlocking of foreign and American companies through their officers?

Mr. ELLIS. Oh, yes; that is an intricate system and much of that is going on today and has been going on many years.

Digitized by Google

Take the example of Mr. Calder.

Senator KILGORE. What is his first name, or initials?

Mr. ELLIS. Curtis Ernest, I believe.

Dr. SCHIMMEL. The present W. P. B. official?

Mr. ELLIS. He was until a few days ago.

Mr. Calder was made Director General of Operations of W. P. B. in January. Our association with more than 1,000 delegates from 40 States, was in session in St. Louis the day he was made Director General, and we passed a hot resolution out there, complaining to the President of the United States and Donald Nelson that this man, who holds many power connections in the United States, and some in Italy, and connections through other corporations in this country that have dealings in other countries, should be made Director General, and be over the authorities in W. P. B. that have to do, for instance, with materials for rural electrification.

We were complaining that Mr. Calder is a director—so lists himself in Who's Who in America—in the Italian Superpower Corporation.

Mr. COLLINS. And still is?

Mr. ELLIS. Still lists himself in the latest Who's Who, the 1942–43 edition.

Senator KILGORE. Do we have a copy of that here? I think that might be interesting to have in the record.

Mr. ELLIS. I think you will find that he is also president of the American & Foreign Power Co. Now that has a connection that is even more important than the directorship in the Italian Superpower Corporation, because that is the corporation——

[Document handed to Senator Kilgore.]

Senator KILGORE. Give that to Mr. Ellis and let him read it.

Mr. ELLIS. Shall I read it into the record?

Senator KILGORE. Yes; read it into the record.

Mr. ELLIS (reading):

Calder, Curtis Ernest, corporation officer. Born, Winfield, Kans., May 15, 1890. Son of Christopher and Sophia MacIntosh Calder. Education, high school. Married Bennie Marie Glanton, October 13, 1914. Children—Curtis Ernest, Jr., Gordon Samuel, Norman Bruce, Benjamin Glanton. Began as stenographer, 1906; construction cost analysis engineer, 1907; chief clerk, public-utility company, 1908–09, assistant secretary-treasurer, same, 1909–10, secretary-treasurer and purchasing agent, also assistant to general manager, 1910–12; Texas Power & Light Co., 1913–17, vice president, 1917–21; president, 1921–27; vice president, Dallas Railway Co., 1917–21; vice president, Texas Electric Service Co., 1917–21; president, 1921–27; vice president, Dallas Power & Light Co., 1917–21, president, 1921–27; now president, American & Foreign Power Co., Inc., Southwestern Sewer Co.; member, board of governors, New York State Exchange; director, National City Bank (New York), Selected Industries, Inc., U. S. and International Securities Corporation, Postal Telegraph, Inc., Italian Superpower Corporation, U. S. and Foreign Securities Corporation—

That American & Foreign Power Co. and the International Securities Corporation are, as I understand, the ones through which they handle these security negotiations for investment and control in foreign companies—

Commander, Order of Merit (Ecuador), Gran Oficial, Orden de Cristobal, Colon (Dominican Republic). Presbyterian. Mason (Knights Templar, 32 degree Shriner). Clubs: Union League, St. Nicholas, India House (New York); Bronxville Field, Siwanoy Country (Bronxville); Sleepy Hollow Country (Tarrytown); American Yacht (Rye, N. Y.). Home, 4 Hampshire Circle, Bronxville, N. Y. Office: 2 Rector Street, New York, N. Y.

Digitized by Google

That No. 2 Rector Street, New York, is the office of Electric Bond & Share Holding Co.

Senator KILGORE. Let's see what edition of Who's Who that is; is it the latest one?

Mr. ELLIS. It is volume 22, 1942–43.

Senator KILGORE. And from your knowledge of Who's Who, that is made up from his own statement?

Mr. ELLIS. Yes, Senator. As you know, they send you and me, when we are honored to be selected for Who's Who, a letter asking us to submit our biographical statement. They put them in print and then send them back to us for correction, so that must be a very correct statement.

There is further interlocking with the manufacturers of electrical equipment in this country and abroad, thus broadening the monopolistic practice considerably.

A good picture of the international power monopoly is outlined by Marquis Childs in his well-known book published by the Yale University Press in 1938 and titled "Sweden—The Middle Way". It is considered a reliable authority, and I want to quote, with your permission, from chapter 3 of this book. [Reading:]

The General Electric Co.—American capital—working through the International General Electric Co. founded a world-wide combine. First, there were a series of companies that General Electric held outright as subsidiaries. Then there were other companies in which the great G. E. had acquired an important, if not a dominant, interest. Then finally there were those companies to which the American firm had extended financial aid in time of stress. In one of its earliest reports to the Coperative Union, Hedberg wrote—

and he was a very great cooperative head of the Scandinavian country—

"By the beginning of the century control of the lamp industry in the United States was definitely concentrated in the General Electric Co. Manufacture proceeded partly in G. E. C. factories, partly in the factories of other firms dependent upon and operating under license from the G. E. C. Gradually a very extensive system of price agreements was thus built up, in strict secrecy; out of deference to the antitrust laws a semblance of free competition was maintained. Finally, however, the law was invoked against the G. E. C., but not until 1911."

Senator KILGORE. That was retained through the patent pools, was it not?

Mr. ELLIS. Partially through the patent pools and also they are able, either through the ownership of patents or——

Senator KILGORE. Or through litigation?

Mr. ELLIS. Yes, sir; or through litigation or through walling off the patents that might be held by somebody else, by concentrating to break a specific company, thus being able, in effect, to prolong their monopoly.

Senator KILGORE. Is there connection between the electric manufacturing industry and the electric service companies—the power companies?

Mr. ELLIS. Yes, sir.

Senator KILGORE. The reason I bring that up is that it was testified to here previously by Mr. Thurman Arnold with reference to the suppression of information on fluorescent lighting at the request of the power companies.

Mr. ELLIS. I will come to that in a minute.

Digitized by Google

In answer to your question, General Electric Co., for instance, was once the holding company, I am advised, of Electric Bond & Share. We think of it, as of them, as the super-super-super holding company, because it was three steps up from many of the operating companies. In my State, you have the Arkansas Power & Light Co., then Electric Power & Light Corporation, then Electric Bond & Share. Electric Bond & Share owns the common and voting stock of Arkansas Power & Light—90.2 percent, according to the Federal Power Commission. Then you had, over that, the General Electric Co., until the Securities and Exchange Commission recently put an end to that. I am afraid some of the old connections still exist.

We think there are some more very interesting connections.

But I will proceed with the quotation. [Reading:]

"As a result, all manufacturers' agreements for the regulation of markets and the control of prices were declared illegal and undertakings were demanded that they should not be repeated. Sales contracts fixing retail prices were also declared contrary to law. Thus, drastic changes were made necessary in the lamp industry. Companies working under G. E. C. license were dissolved and their manufacture then taken over by the G. E. C. Sales policy was altered so that the manufacturer sold direct to the ultimate consumer, wholesalers and retailers functioning as agents of the manufacturers, handling only on consignment."

You see, to avoid that thing, they just dissolved the companies and thereby got rid of the connection because it was then all the same company.

"Legal proceedings had thus served merely in the long run to consolidate the electric lamp industry still more thoroughly. Price agreements between factories violated the law, but not through the purchase of one factory by another. And though the manufacturer might not dictate the price an independent retailer should charge, he overcame that difficulty by making the retailer his agent, selling for him. The whole story is an excellent example of the difficulty of combating the trust effectively by means of legislation."

Hedberg's researches, which took him to many European countries, brought out clearly how the trust had extended its power, levying tribute from consumers around the world. Interlocking patent agreements made it virtually impossible for an outsider to encroach upon this enormously profitable domain. But Hedberg became more and more convinced that the Lamp Trust could not be ignored; that, hopeless as it might seem on the face of it, cooperation, and, if necessary, Swedish cooperation, would have to confront the reality of price dictation in this field. The price variations from country to country were utterly irrational, based, it seemed to Hedberg, upon the simple precept of charging whatever the traffic would bear. The price in 1928 for a 25-watt lamp was 37 cents in Sweden, 30 cents in Holland and Germany, 27 cents in Denmark, as low as 18 cents in Hungary, and 52 cents in England.

Dr. SCHIMMEL. Was that affected by the existence of such firms in Holland as Phillips and Ostrum?

Mr. ELLIS. I have read that is true, but am unable to verify it, and do not know.

Swedish cooperatives managed to purchase a factory, expand it, and to break the world electric-light bulb monopoly. Prices of ordinary bulbs tumbled from 50 cents to 15 cents right here in the United States, and the companies still made money.

As long as we have in this country a system of controlled patents and monopoly of industrial processes we cannot have free competitive enterprise.

We owe a debt of gratitude to the Swedish cooperatives for breaking this world-wide light combine. I, for one, would like to become fur-

Digitized by Google

ther indebted to them. The international monopolistic patent cartel combine makes for economic dictatorship. If there is anything to be feared almost as much as political dictatorship, it is economic dictatorship. They breed on each other. The German cartel combine was one of the principal vehicles by which Schicklgruber became Hitler. If we are going to have a high standard of living for the people of America, particularly the rural population, which is so often forgotten, we must have a strong Federal agency which is charged with the duty of looking for the better things and making them available to the people at reasonable cost. In other words, such a Federal agency must not stop at the point of breaking present patent pools and monopolies—assuming that is possible—but must go beyond this into the realm of active research and development in the interest of the American people.

I think that this bill provides for such an agency. The bill has been attacked by selfish interests whose extortions would be curtailed by its passage. It has been called totalitarian in principle. Charges of regimentation and all of the bugbears have been flung at it. In my opinion, if it has a weakness, its weakness is that it does not go far enough in attacking the monopolies which hamstring the development of this country.

My field—electric power—has been a fertile field for monopolistic combines. One thing after another has been kept from the American public because vested interests have served themselves at the expense of the people. Fluorescent lighting is an outstanding example of this. This superior lighting was kept off the market for many years and is even now being held back as much as the electric monopoly can hold it. And yet it has been established beyond doubt that fluorescent lighting is superior in candle power to incandescent lighting of equal wattage. It is infinitely cheaper to the consumer. But patent controls have enabled the electric trust to saddle the more profitable incandescent system on an ever-suffering public. Electric light bulbs and lamps manufactured under the control of the power trust are still designed to use more power rather than produce more light.

Senator KILGORE. Sometimes that hold-back creates profits for still others—inefficient lighting tears down eyesight, which also helps the spectacle monopoly.

Mr. ELLIS. Yes; and, incidentally, I am sure the Senator knows well, we have a very interesting case in connection with lens production that gets back to Germany, where certain American companies agreed to stay out of certain competition with the German glass cutters.

Senator KILGORE. In other words, poor light directly attacks the health of the American people.

Mr. ELLIS. Absolutely.

Senator KILGORE. Mr. Arnold testified that the power companies objected to even a demonstration and exposition on the effectiveness of fluorescent lighting showing it would cut down power consumption and increase light.

Mr. ELLIS. All these lamps [indicating ceiling fixtures in the committee room] are designed not to produce light but for beauty and to use more power. When you hang this type of lamp in the room, Senator, you cut off most of the light and permit a little to get out at the bottom. Here [indicating] in these glass containers that hold all the dirt they collect just a little light gets out at the top.

Digitized by Google

Senator KILGORE. As a matter of fact indirect lighting, which has been greatly boosted, is one of the greatest users of power that we have.

Mr. ELLIS That is right.

Another good specific example of how the electric monopoly works against the public interest is found in the story of the struggle by rural electric cooperatives to lower consumers' power costs by changing the type of meter in rural areas. A 2-year struggle began in 1936 when the chief engineer of the Michigan Public Utilities Commission attempted to change over from the old meter to a cyclometer. The older type meter is a complicated instrument and is almost impossible to read except by one having a technical knowledge of the subject. You know the type; some of the wheels run one way and some another. This engineer felt that power costs could be cut down considerably by eliminating the expense of monthly meter reading, which amounted to 11 to 15 cents per meter for each reading. He proposed the substitution of the cyclometer which can be read easily by anyone and which is not unlike a speedometer in appearance.

The idea was to have the farmers read their own meters and mail the reading to the cooperative regularly. A company reading every 6 months would check the farmer's accuracy. It was found that this could be done at a cost of 3 to 5 cents per meter reading, and it was proposed to pass the saving along to the consumer. The Public Utilities Commission called General Electric and Westinghouse together and asked that they make available such a meter. The answer was a flat, "No; it can't be done." The chief engineer then went to Canada, where the cyclometer was in use. He found that these cyclometers were made by General Electric and Westinghouse to meet competition from a Swiss meter manufacturer. When he went again to General Electric and Westinghouse they protested on different grounds. So the Sangamo Meter Co., of Springfield, Ill., was called on. They agreed to make the meters, provided that a minimum order of 25,000 was placed with them.

Ten R. E. A. cooperatives pooled together and ordered that number. When General Electric and Westinghouse learned of this they immediately produced a cyclometer and put it on the market in Michigan. R. E. A. quickly made its use Nation-wide at tremendous savings.

These great electric monopolies had maintained that the meters could not be produced for various technical reasons, although it developed that they were producing them for distribution in Canada all the while. Their real reason for refusing to make the cyclometer available to the American consumer was that they feared that if the consumer knew how much electricity he was using he might be able to control his consumption and keep it within the minimum. I might add that the reverse has proven true. The cyclometer is now in use in this country in almost all areas where cooperatives are operating, and costs have tumbled. The private utility companies continue to use the old-type meter.

Dr. SCHIMMEL. Do you believe that rural electrification has been held up by lack of adequate research along those lines?

Mr. ELLIS. Yes; indeed. It has been a terrific struggle to get the equipment to fit a particular or a peculiar need because of the monopoly, and in many lines of construction the power interests have said—and have convinced some of the smaller manufacturers—that

Digitized by Google

"it cannot be done," and consequently R. E. A. has had to go out, over a long period of years, and engineer low-cost lines that are now in existence all over the country.

Senator KILGORE. As a matter of actual fact, the cooperatives have had to go to their competitors to purchase equipment?

Mr. ELLIS. These cooperatives, Senator, have been on their knees begging for engineering, for equipment, and for power. I might also throw this in here: Because of combines which exist, the power companies have been able to place their men in high places in Government down through the years to help perpetuate and control the monopolies, not to mention the fact that the power companies usually control the State utilities commissions.

It developed when the Office of Production Management was set up that the first man to head the Power Division, the first director of the Power Division of O. P. M., was C. W. Kellogg, who was and is head of Edison Electric Institute, the national association of these big holding and operating companies. He was the first director of the Power Division of O. P. M. and brought in with him a great group of Electric Bond & Share people, chief of whom was J. E. Moore. According to the latest issue of Electric World, Mr. Moore is the man whom they call in, down at the Power Division of O. P. M., to help work out the matters.

Senator KILGORE. Now the W. P. B.

Mr. ELLIS. Yes; W. P. B. It is the same rose by a new name.

J. E. Moore, I am advised, is a dollar-a-year man and came from Electric Bond & Share. It also developed that Col. John C. Damon, who was in charge of power at the War Department, is the same Col. John C. Damon who was in the power set-up in World War No. 1 in the War Department. He was helping work out these deals to give all the power contracts to the private companies and never permitting the cooperatives to furnish any of the war projects if he could help it, even though most of the new war projects were placed out in the country in the natural territory of the cooperatives and not in the towns.

Recently, Colonel Damon was relieved down at the Power Division of War Department following a scandal which developed about the war contracts.

The point I am making is, because of their power, because of the combine, because of the cartels and all that goes with them, they are able to place their men in these high positions to get the job done.

Perhaps the power companies today are as near running this country in this war crisis—they took advantage of the crisis to come in—as any other group of people.

Dr. SCHIMMEL. To what extent were private companies willing or able to develop rural electrification in the United States?

Mr. ELLIS. I am glad you said "willing or able." We do not know whether they were unwilling or whether they were unable. I think they thought they were unable, and perhaps they were unable because of the terrific watering of their company stocks, because of the write-ups of many kinds which had no excuse for being, because of the practices which they—well, you can't bribe Missouri legislators with nothing, and you have seen recently where certain high officials of the Union Electric Co., of St. Louis, are no longer at large. That

Digitized by Google

thing has been going on all over the country, as we know from court records, almost since the beginning of the private power companies.

They did not go into the rural areas because in my opinion, one, there was not the great profit there; two, their costs, which they held up artificially, would not permit it at a price which the farmer could afford, and even today these cooperatives are having to buy their power from the power companies all over the country at the power companies' own prices. The cost of that power is based on all the high-cost figures which are included in the power companies, and these cooperatives in many, many instances are buying their power from the power company that operates in the town around which the co-op is located, at a wholesale price fixed by the power company; then, they take the power out into the country even though the private company has held the wholesale price away up, and sell it to the farmer in thinly settled areas at less than the power company does in the towns, indicating that the private companies must make terrific profits in the cities.

Dr. SCHIMMEL. And your experience there would indicate that the benefits could not be brought to the countryside without Federal action?

Mr. ELLIS. Right, the cooperatives, financed by Federal loans, have been the answer. The farmers have no way of pooling themselves together for the purpose of achieving scientific development, or to do the research necessary, except through the Department of Agriculture—and that is very limited and wholly inadequate for it does not deal generally with equipment—which is another argument for this bill.

Senator KILGORE. We used to have little rural cooperative telephone companies all over the country, and they have all gradually been taken over.

Mr. ELLIS. Why, Senator? In my opinion, because the big companies could do the research, could control the monopolies, control patents, and would not make those patents available at sufficiently low cost to permit our rural people to carry on.

Senator KILGORE. It was hard for them to get instruments, I know that.

Mr. ELLIS. And finally the modern instruments outgrew the old ones, and they simply could not continue.

In this country we have a living example of how Government control of technology and science has contributed to the general welfare. The United States Department of Agriculture is an outstanding example of this in certain fields. Through federally subsidized and directed research, agriculture has advanced by leaps and bounds. The agricultural experiment stations, an integral part of our aggrarian economy in every State, have carried forward this theory with highly successful results to the American farmer, particularly the little fellow who must depend upon State and Federal assistance if he is to keep abreast of the rapid development of civilization.

The T. V. A. is another good example of how Federal technological activity can help people, a good example of the purpose that can be served by this bill. This agency has made great progress in the development of cheaper appliances and lower power rates and, to a limited extent, has served the purpose of this bill. Its achievement

Digitized by Google

in the production of concentrated phosphate fertilizers is an example. It has met, of course, with bitter opposition from the power combine. The same interests who opposed and are opposing T. V. A. are the ones who are bittery fighting the rural electric cooperative movement, which I represent.

Senator KILGORE. Let me interrupt there, Mr. Ellis. Don't you think the work done by the Federal Mine Research is another outstanding illustration?

Mr. ELLIS. Right, Senator.

Senator KILGORE. I know, to start with, the operating companies fought them tooth and nail and would have nothing to do with the Federal Mine Research, or any Federal work at all.

Now they are relying absolutely on them for suggestions as to economic mine procedures, in lifesaving, in mining, and our Bureau of Mines has done more for them than any other branch that they have ever dealt with.

Mr. ELLIS. That is right; the Bureau of Mines looks at all of those angles and not only helps the consumer ultimately but works with the operators in establishing sources of mineral supplies and, in fact, takes every phase of that business and works them all together for the common good of the people.

Senator KILGORE. At present the small- and medium-sized manufacturers are utterly denied Federal assistance.

Mr. ELLIS. That is right.

Senator KILGORE. He has nobody to go to.

Mr. ELLIS. The big companies engaged in mass production of certain given articles are slow to break away from that particular commodity, even though a better one might be produced, if they control the patents, and yet they usually strive to control the new patents to keep other manufacturers from producing the improved articles.

In my judgment, a part of the fund appropriated pursuant to this act could well be applied for the benefit of our rural population in conjunction with our State institutions.

Such funds could be used beneficially for conducting research, investigations, experiments, including the purchase of necessary scientific apparatus relating to development of natural resources and power, applications of machinery and equipment to economical and efficient production, invention and development of useful products and processes, utilization of surpluses and trade and industrial wastes, improvement of living and working conditions, with special reference to housing, health, sanitation, and safety—planning, design, construction, management, and maintenance of engineering projects.

In addition, the funds could be used for printing and dissemination of the results of investigations, research, and experiments for the information and benefit of the people; development of research for improved methods in canning and processing meats; vegetables, fruits, and other foods; planning and design of equipment for development, with the use of electric power, of local industry, such as canneries, woolen and cotton mills, oil mills, fertilizers, refrigeration plants, processed foods, balanced stock and chicken feed, lumber fuel from grains, chemicals, and many other uses of the farmer's waste product.

I read in the newspapers that the science mobilization bill, S. 702, has been termed the "Magna Carta of Science." In my opinion, the

Digitized by Google

bill should also be termed the "Rural Liberation Act," for it has strong possibilities for bringing new benefits to the small farmers and rural folk of America. These people are the last to share in the new developments of civilization. And, by the way, these small farmers are in the majority, by far the majority.

Most of our farm people today are producing for a twentieth-century war with eighteenth-century equipment. A Federal agency which will develop the Nation's resources will help these often forgotten people to assume their proper place in the Nation's economy. Only by full and free utilization of American scientific and technological resources and facilities can the rural people hope to enjoy the richness of modern life. A monopolistic economy denies them this right. The proposed office of scientific and technological mobilization would accomplish the desired results.

Senator KILGORE. Mr. Ellis, would you explain for the benefit of the record the relationship between the Rural Electric Cooperative Association and the Rural Electrification Administration—just how they work together, and so forth?

Mr. ELLIS. Yes, Senator; I shall be happy to do that.

The rural electric cooperatives have simply borrowed money from the Rural Electrification Administration. There was no subsidy whatever; in fact, the interest they are paying amounts to a profit to the United States Government. The Rural Electrification Administration, however, has done an excellent job of administering, helping, and guiding these cooperatives.

All industrial and professional groups over the country, of any size, have a national organization. This National Rural Electric Cooperative Association was organized a little over a year ago, incorporated in the District of Columbia as the independent association of all of these cooperatives, power districts, and public-utility districts, and they pay into the association a membership fee plus 10 cents per connected consumer per year. The individual cooperatives have their own publications; they have their own annual meetings. Their people know and are conscious of the fact that they are paying—it amounts to less than 1 cent per month per consumer, but there are over a million of them—to maintain and operate the national association.

Senator KILGORE. The national association can assist in preventing individual cases of oppression against electric cooperatives?

Mr. ELLIS. Right; and those individual cases are pretty widespread, Senator.

Senator KILGORE. The attorney general of the State I come from used, up until 1941, the entire legal force of the State, coupled with that of the public service commission, to block every possible form of cooperative, even where power companies said they could not furnish the power. And because of that, we were unable, in my State, to take advantage of the possibilities of rural electrification.

Mr. ELLIS. And you can look sadly, Senator, at a map of the States showing the R. E. A. co-ops, and your State stands out like the Sahara Desert as one of the States that has practically no rural electrification. West Virginia has, I believe, only two cooperatives.

Senator KILGORE. I know. The attorney general of the State engaged the State's entire legal forces in a fight against two things:

The first was to prevent the Federal Government from erecting a

Digitized by Google

flood-control dam which might later be turned into a power dam; and the second, to prevent the formation of rural cooperatives in territory not served by any electric company.

Mr. ELLIS. Your State is coming into the program, and with your help; and one of the purposes of this association is to get out there, and get into the fight, because the Rural Electrification Administration, as a Government agency, just cannot do it.

Senator KILGORE. The people of one particular section that I knew well came to me. They had petitioned for 4 years—and had deposited money in escrow with one of our power companies—to put in a power system in this agricultural section. They had donated the right of way; they had given the poles; they had done everything but put up the wire, and they would have done that if they had had an opportunity, and they wanted to buy the power—all without result. Finally, on my advice, they started to form a cooperative, and immediately the power company came alive and started building that line right away.

I think, however, it probably cost them more, at the outset, than they would have had to invest in a cooperative company; but they felt that was because the State legal forces did not want a farm cooperative to be established; that is, under the attorney general—who is not now the attorney general.

Mr. ELLIS. I may say to you that I have had the pleasure of talking with several of your people, and they are very much interested in rural electrification cooperatives, and they are conscious of your friendship, Senator Kilgore, and I think that much can be done in West Virginia in the next few years.

Senator KILGORE. I think so, and it should be done.

Now, for the benefit of the record, I wish you would explain how a cooperative is formed.

Mr. ELLIS. May I use a specific example from my own country?

I live in northwest Arkansas. My father and mother live on a farm—I grew up on it—and they had been trying and trying to figure out some way of getting electricity into the home for endless years.

Senator KILGORE. Because electricity means ice, preservation of butter and eggs, and many other things besides just light on the farm?

Mr. ELLIS. It meant a new way of life.

There is as much difference between having electricity and not as there is between riding in an airplane and in a log wagon.

My parents, our neighbors, and neighbors in the several counties desired to have electricity but could not figure out a way. I as a young man tried with them to get the Southwestern Gas & Electric Co. to come into our area, to build lines into our community from Rogers, some 12 miles away, but the company would not do it. Finally they heard that the Rural Electrification Act had been passed.

I was, at that time, in the State legislature and introduced what became the first Rural Electrification Act in Arkansas, under which cooperatives were later organized.

These people got together and they wrote to Washington and asked for somebody from the Rural Electrification Administration to come down and tell them how the thing could be done. A representative came and they had several meetings, at which he said, "You have got to go out here and get the equivalent of three people to the mile, over a few hundred miles of line, to sign up and to pay in $5, which

Digitized by Google

is to be membership in the State corporation, a cooperative corporation." When they had done that and gotten organized, had been incorporated and had elected a board of directors, the Rural Electrification Administration then made a feasibility study of the area. When they found it feasible, they made an allotment out of the funds Congress appropriated to them and sent their own men there to help work it out. The cooperative then, upon R. E. A.'s advice, employed engineers who were capable of working up the system. The money was paid out to them as they needed it. They contracted, with the help and guidance of the Rural Electrification Administration, with contractors to build the line.

Now, when the lines had been built, the board, upon the advice and counsel of the Rural Electrification Administration, selected a manager to manage the cooperative. Then he selected his linemen and other employees. They had to work out a source of power and some power company—that is often very difficult—and having gotten this source of power, they had a big celebration "to energize the line," and then they had electricity.

That is briefly the story.

Senator KILGORE. Now, what about the operation? Once having gotten the lines energized, do you have any trouble with defaulting of payments to the Government on the part of cooperatives?

Mr. ELLIS. Senator, one of the most amazing examples of public financing is the R. E. A. co-ops. I dare say that perhaps not in all the loans of the R. F. C. have they such a record as we have made. As you know, the R. F. C. has loaned most of the money to the R. E. A. Certainly, the loans on the part of the R. F. C. to the railroads, and the loans to various other private enterprises in America, would not begin to compare with the record of the electric cooperatives. They are now paid ahead on all of their money—although they are required to pay the loans off in 25 years—they are paid ahead on those loans more than $10,000,000 to the Federal Government.

It is true that, because the war caught some just in the beginning of construction, these particular ones—I know one that has only 12 miles energized—could not get any more wire. They are in some difficulty financially, but it is not their fault and they will pull out after the war.

Senator KILGORE. The over-all picture is good?

Mr. ELLIS. The over-all picture is extremely good. The power companies said it would not work. They said:

"You cannot make electricity available to rural America; the people are scattered out too much."

But it is working.

Senator KILGORE. Was not a study made whereby lighter transformers, cheaper ones that worked just as well or better, were developed by the R. E. A.?

Mr. ELLIS. There is a big story on transformers. I do not know it all—I am not an engineer—but the Rural Electrification Administration, I understand, made as great progress on the transformer program as on the meters. The whole Nation is indebted to them for it because it is bringing to us cheaper transformers, and consequently cheaper electricity. The effect of the work of the R. E. A. and the cooperatives is today bringing down the price of electricity everywhere,

Digitized by Google

even in Washington, D. C., and that is why private power companies are fighting us desperately and that is why the newspapers who are influenced to a great extent by many of these big power company ads are fighting the rural electrification program.

Senator KILGORE. Are these rural electrification projects rendering any assistance in the war effort at the present time?

Mr. ELLIS. Senator, I am glad you asked that. They are of invaluable assistance in the war effort. In certain areas, they are now serving air beacons and airfields, many small projects all over the country, and some factories, and, of course, that is a direct benefit to the war effort. Then, of course, every electrified farm can produce substantially more food than if it were not electrified.

There are instances where the War Department, however, sent their men out and tore down the R. E. A. lines in an area—though the co-ops had transmission lines big enough to serve the project they were going to locate in that vicinity—and paid a power company to build in from some distance away to serve those projects.

Senator KILGORE. Do you have any specific instances of that kind which you could cite to the committee?

Mr. ELLIS. Yes, sir; at Neosho, Mo., which is north of my home in Arkansas, is Camp Crowder, where the local cooperative there had lines in the area, including a transmission line. The War Department came in while Colonel Damon was in charge of power and ordered those lines torn down. The cooperative there offered to furnish the electricity. The Empire District, the big company there, offered to furnish the power. Empire was given the contract. The R. E. A. lines went out. Empire built transmission lines and today is serving the camp at a substantially higher rate than that offered by the co-ops.

Another case of a slightly different type is at Camp Gruber, Okla. That camp is located out in the Cookson Hills country, in a wooded area, and no towns of any size are nearby. There was no power system serving the area. The power had to be brought in from the Grand River Dam a few miles away. It didn't make any difference who furnished the power to the camp; it had to come from the dam. The Public Works-R. E. A. set-up down there offered to furnish that power at 5.2 mills per kilowatt-hour. The Oklahoma Gas & Electric Co. made a bid—we did not know at that time what they bid—and the War Department let the contract to the Oklahoma Gas & Electric at a rate that figured 10.8 mills per kilowatt-hour. The difference between the two contracts amounted to about $124,000 a year.

Senator KILGORE. Did the War Department go ahead in both instances?

Mr. ELLIS. After some investigation and—if you will pardon my country slang—"a whole lot of hell-raising" in the House by the Oklahoma Members of Congress and myself, and by all the people down home who were protesting, too, the War Department canceled the contract with Oklahoma Gas & Electric, and gave it to Public Works.

Senator KILGORE. But the Missouri proposition went through?

Mr. ELLIS. Oh, yes, sir; and many, many others went right ahead. As I recall, all the others went ahead, and that is one of the reasons, as I understand it, behind the Coffee resolution, which is pending now in the House to investigate the war power contracts.

Digitized by Google

Senator KILGORE. Are there any efforts such as spite lines used to break up these cooperatives?

Mr. ELLIS. Senator, if we were to put on record the whole story of spite lines, the American people would not believe it, because they do not believe that those power companies are thieves and robbers.

In all sections of the country when you go to work up a cooperative you may have a meeting one night in an area where the people have been trying for years to get the power companies to build lines, and when you wake up the next morning there is a power line down the road, built at night by the power companies—spite lines. Those instances have happened all over the country. Of course, they cannot build a lot in 1 night, but they also build spite lines in the cream of an area, forcing the cooperative to build in the outlying edges or sections, and perhaps making the project not feasible. That has gone on and is still going on because the power companies know that the rural electrification cooperatives, by the examples they are setting, are ruining their high-cost, extravagant set-up.

Senator KILGORE. And in that case their intent is simply to skim the cream from the power market and not let the cream take care of any of the blue milk?

Mr. ELLIS. Right.

Senator KILGORE. To what extent is line construction now being carried on by cooperatives and power companies?

Mr. ELLIS. When the War Production Board issued its P–46 last July all construction was stopped and materials frozen. Construction remained completely stopped except in a few specific instances where wire had to be run into an area to serve a war plant, or something like that, until January. In January we held our first annual convention of the cooperatives in St. Louis, during which, incidentally, the President of the United States sent us a message, as did the Secretary of Agriculture. Three Senators were there—Senator Russell, Senator Aiken, and Senator Butler—and addressed the convention. Senator Norris spoke, Chairman Olds, of the Federal Power Commission, Mr. Pope, of the board of directors of the Tennessee Valley Authority, and a representative from Bonneville—it was an all-power meeting and the first one held in America. We passed some strong resolutions. We had been doing some work before on the War Production Board, asking them to permit the use of material that was frozen. There was enough frozen to electrify some 30,000 farms. We had conducted a survey to determine how much you could increase production with rural electrification. In the vital foods—this would not be true in the grains—the composite answer from the cooperatives was that you could increase the production of meat, milk, eggs, vital foods, by electrifying the unelectrified farms, by 23.7 percent.

We continued to work with the War Production Board, insisting that they permit the electrification of further farms, and they, through a series of orders, have permitted some additional construction. They are permitting the use of most of these materials that are idle. They still have not given us house- or farmstead-wiring orders to permit wiring of farmsteads as we think they should be. Some of the men in the Power Division of the War Production Board have done much in an effort to work out rural electrification for the Rural Electrification Administration. Some are sympathetic; others are not even friendly.

Digitized by Google

More wire is going to be made available, according to what they tell us.

Senator KILGORE. Was that freezing due to a copper shortage directly?

Mr. ELLIS. Ostensibly. I am afraid it may have been due, to some extent, to the fact that so many Electric Bond & Share fellows were and are in the Power Division of the War Production Board.

Mr. COLLINS. Were inventories taken of the copper in private and public hands at that time?

Mr. ELLIS. Yes, sir; I understand so.

Senator KILGORE. Has there been much experimentation carried on in an attempt to develop a transmission substitute for copper?

Mr. ELLIS. Yes, sir; considerable, but the facilities are limited. Great work has been done with aluminum, but that did not help much here because aluminum is as scarce as copper, or was when the war came on. Scientific studies have to be made, and are being made, in steel; and though steel does not conduct so far or so well and will not last so long, it can be used.

Senator KILGORE. Too much line resistance?

Mr. ELLIS. Right, but it is being used, and the War Production Board is making more and more steel available for line construction.

Senator KILGORE. During the emergency that is, to be replaced by copper later?

Mr. ELLIS. Ultimately to be replaced by copper, or some other substitute, such as aluminum.

Mr. COLLINS. Did the inventory disclose any hoarding in private hands?

Mr. ELLIS. Yes; but I cannot give you the figures; only the War Production Board has those figures.

Senator KILGORE. Do you know the number of farms in the country that are not electrified, and are there any plans that have been prepared looking toward the electrification of those farms?

Mr. ELLIS. I am not your best witness in reply to that question, because the Rural Electrification Administration has recently conducted an unelectrified farm survey. Charlie Falkenwald, who was chief of the Applications and Loans Division, and made that survey, died a few days ago. Mr. Gerth, who is Acting Chief of Applications and Loan Division now, could give you that information as, of course, could the R. E. A. administrator, Mr. Slattery. However, I understand that they determined that of the some 6,000,000 rural establishments there are about 4,000,000 that are not as yet unelectrified. They discovered there were many more than they first thought.

Senator KILGORE. Do you have anything further to say on what the setting up of an over-all research or technical agency by the Government would mean to the dirt farmer?

Mr. ELLIS. My work is with the dirt farmers.

Senator KILGORE. Yes; I am not talking about the big bank or insurance company owned farms or plantations, but I mean the American farmer, as we picture him, the man operating his own farm.

Mr. ELLIS. In every way that the mind can conceive of, the American farmer, the dirt farmer, would be helped by this bill. Everything which he grows, he ought to be able to process in the community where he grows it before it goes to market. Out of the processing usually

Digitized by Google

comes the profit, processing and merchandising, not in the production of the raw material. Technological advancement would help him tremendously.

You have instances now of what farm food dehydrators can do, about how they are being put in, and about electrical brooders being put in to help in the raising of chickens and the raising of pigs, and greater production stems from it. Everything the farmer grows could be processed to some extent, or could be better produced with technological advancement. Even in the matter of transportation, the farmer could be helped. In many areas he does not have adequate transportation, and he has not been given the benefit of all the modern advancements in transportation for his marketing. If he had the means by which he could better communicate with his fellow man, he would have a distinct advantage. Great marketing possibilities exist. Some of these days we are going to have a telephone system—I am not at liberty to discuss it, although I know about it—a telephone system that will amaze the human mind. The thing has been held back because certain interests do not want to put it on the market, and the farmers are the worst sufferers because they do not have available to them the telephones of city people.

Senator KILGORE. I was very much interested in reading recently of the freezing and cold storage lockers that are rented in some towns to farmers to store fresh meat and other products for the winter. It seems to me that there is no reason why those lockers should be in one building. I believe it would be just as possible to have a locker right in the farm house, just as possible as it is to have a refrigerator there.

Mr. ELLIS. The cooperatives have led the building of rural refrigeration lockers. T. V. A. really pioneered it, and there again you have the example of a Government agency breaking the log jam to get a much needed piece of equipment into the rural areas. If it had not been for the T. V. A. and the R. E. A. and in turn the local cooperatives, such a thing might not be in existence. They help the farmer on the health angle because farmers with electricity can now have fresh meat all the year, and on the farm where I grew up it was a very, very rare thing ever to taste fresh meat from one cold season to the next, except chicken on occasional Sundays.

Senator KILGORE. You will note that in this bill the funds provided are what you might call discretionary funds for the Director, so he need not confine them to his own office, but could subsidize and experiment, for instance, in agriculture or in mining through another agency that would, in the opinion of the Board, tend to foster the best interests of the country.

Mr. ELLIS. That is very good, Senator. Many States have their own State institutions; for instance, in some States where they have a mining potentiality, they have emphasized a school of mines——

Senator KILGORE. As in my State.

Mr. ELLIS. And this authority, the agency which encourages and cooperates and works with them, will supplement and assist them in their efforts.

Senator KILGORE. I have also found that frequently research along one line will develop a nuisance byproduct which might be of tremendous value to some other phase of our economy.

Mr. ELLIS. That often happens.

Digitized by Google

Senator KILGORE. But, unfortunately, in private research, if it does not fit into the immediate project, it is often allowed to languish without complete development taking place.

Mr. ELLIS. Yes, sir; that seems to be going on all the time, and there is now no practical way of bringing that into the open. There is another thought that I might bring in, too.

Germany was ahead of us in much of her scientific development along certain lines because she had entered into these cartel combines with other industrial countries, the chief of which was the United States, not to invade those fields, and Germany having the kind of system that it has, always was able to forge ahead in those particular developments whereas in our so-called free-enterprise country nobody was working with the interest of the whole public at heart, and our people suffered. Now, Germany, as we all know, has never had free competitive enterprise in all her history. I think I ought always to use the word "competitive" because the monopolies claim they have free enterprise and I am afraid that they do—too free.

Now, under the German system, the government has worked with the industries to help them get a strangle hold on the rest of the world. The peoples of all nations have suffered to aid the German monopolies. Remember the recent Standard Oil scandal.

Senator KILGORE. The American practice comes close to the case of liberty becoming license.

Mr. ELLIS. That is right.

Under the German system of no free competitive enterprise, especially when the Government itself would sponsor certain types of development, they have been able through the years to forage 'way ahead. For instance, they were subsidizing the airplane industry and the development of certain parts for airplanes when we in this country were just doing nothing about it. It is true that in this country, railroads, and bus lines and other forms of transportation were opposed to it. I served on the Post Office and Post Roads Committee of the House when these other interests were opposing airplane and airplane development, while in Germany air transportation was going on at a tremendous pace.

Now, if we are going to have free competitive enterprise, if we are really going to have a free democracy, then at the same time we must not permit the great industrial corporations to involve us industrially in almost the same manner as the German dictatorship.

Senator KILGORE. If there is anything else you would like to have in the record, we will be glad to have it.

Mr. ELLIS. I think this bill will go a long way toward lifting agriculture out of the peonage conditions that exist, and setting it over into a modern world. The agricultural people are depressed, disheartened, leaving the farms and not going back, because of the abnormal situation that has existed over the past years. Many of the more aggressive left the farms and went to the cities and hope never to go back. We have been destroying agriculture as a way of life in America, because of these conditions.

Senator KILGORE. Every farm electrified means a customer for electric refrigerators, for electric light and, if reasonable priced, for a food locker, or for any number of other pieces of farm electrified equipment, and it creates more markets within the United States for the manufacturers.

Digitized by Google

Mr. ELLIS. Yes, sir. I believe we are going to save the equipment manufacturers in spite of themselves.

Senator KILGORE. Now, however, if that manufacture is concentrated in a few centers, it will stultify itself, by reducing the consumer market so the farmer cannot buy the equipment.

Mr. ELLIS. You have mentioned one of the most important things that R. E. A. has seen.

Senator Norris said, at our St. Louis convention, and these are almost his exact words: "It would not surprise me if many of the great inventions of the future come from the farm boy who used electricity to make new discoveries."

Our people on these farms are now, from the Atlantic to the Pacific, and have been, inventing all kinds of gadgets. What do you think they can do with them? They come here and try to get patents. Your people write you, I know, to help them get patents and the average American today cannot get a patent on anything. He does not have the money to finance a patent lawyer's research, he is certainly not helped by the Federal Government, and it would appear to him that the Federal Government actually endeavors to prevent him from getting a patent. If he gets a patent, and very few of the cooperative people have gotten them, always before he is able to know what he really has, there are those ready to prey upon his discovery or invention. If he develops something that might be completely revolutionary to some phase of agriculture, he does not know what he has, does not have the money to start a development of it, and along comes one of the manufacturer's agents and says: "I will give you $100 for it," and it [snapping his fingers] is gone.

Senator KILGORE. And thus starts the patent pool.

Mr. ELLIS. Thus continues the patent pool, sir.

Senator KILGORE. Now, we have some evidence that has been introduced, for instance, in the Truman committee in the hearing on rubber, with reference to that racket. We have a letter from an outstanding patent lawyer to his client asking him if he did not think it was going to be dangerous to carry on very many more infringement suits along a certain line, that he thought they were wearing the patience of the American public too thin, that while the infringement suits were accomplishing the purpose of eliminating competition, he feared that some time the American public would get tired of such things.

Mr. ELLIS. Without being derogatory or casting reflections on perhaps the greatest inventor, it has been said many times that Thomas Edison's success was due as much to the fact that he was a great patent specialist as to the fact that he was a great inventor. Senator, so far as the future is concerned, I am as much afraid of the danger that exists from the cartels as I am from the danger that exists from nazism, fascism, or communism. These cartels are more dangerous than dive bombers. They breed dive bombers.

Senator KILGORE. A company like Farben is able to make cartels which amount to treaties.

Mr. ELLIS. And are more binding.

Senator KILGORE. Their business diplomats are far-sighted people.

Mr. ELLIS. Their agreements are far reaching. Changes of administration don't disrupt them.

Senator KILGORE. Is it not because dollars and not lives are at stake?

Mr. ELLIS. Yes, sir; I am afraid that the very interests which have

Digitized by Google

preached isolationism in this country have made isolation an impossibility by their practices abroad.

Senator KILGORE. Thank you, Mr. Ellis.

Mr. ELLIS. Thank you, gentlemen.

Senator KILGORE. The next witness is Mr. Slattery.

(The witness was duly sworn by Senator Kilgore.)

TESTIMONY OF HARRY SLATTERY, ADMINISTRATOR, RURAL ELECTRIFICATION ADMINISTRATION

Senator KILGORE. For the benefit of the record, will you state your name and official connections?

Mr. SLATTERY. Harry Slattery, Administrator, Rural Electrification Administration.

Senator KILGORE. Mr. Slattery, we are considering S. 702, and we should like to hear anything you have to say on it because, although it does not seem sometimes to be appreciated, the purpose of the hearings on the bill is to improve it, if possible, and also to inform the public of its exact purposes and possible effect.

Mr. SLATTERY. Senator, I would like to start off by stating briefly my background, which would indicate that I have some knowledge, I think, of the subject before you in this bill.

Senator KILGORE. I wish you would do that.

Mr. SLATTERY. I have been more or less in and out of Government service for 37 years. First, I go back to the days of Theodore Roosevelt's administration; I first worked with the Inland Waterways Commission. I worked with the Conservation Commission, which was an important commission that first began the study of the whole question of conservation. The Commission later made many studies and many reports on the question of development of the resources of the Nation.

I was with that Commission and afterward, under the Tawney amendment, it was abolished, but later was carried on as a semi-private organization.

I have been with many of the Government activities that had a bearing on the resources of the country. I knew of the early fight, going back to the so-called Ballinger days. I was associated with the Ballinger committee and, of course, I naturally began at that time to know about the whole scope and ramifications of the great natural resources of the country. I was connected with the Forest Service which, in its early days, began the creation of the national forests, now, of course, under the care of the Forest Service. I served for many years under Gifford Pinchot, the father of the conservation movement.

I knew a great deal about the early effort to secure legislation to protect these great resources, the forest resources, mineral resources, water and oil resources, and, of course, it naturally impinged on the question of the scientific end, the development of our great resources. The Bureau of Mines, which was created back in those days, was a tremendous step forward. I had some knowledge of that, and of the first set-up of the Bureau. I went in the Department of the Interior in the pre-war days, under Secretary Franklin K. Lane as a

Digitized by Google

special assistant, and afterward went back to the conservation organization.

I knew, of course, the early projects on water power and probably that is one of the reasons why I had a background to occupy the position I have now. I know about the early creation of Boulder Dam. I was sent, by Secretary Lane, out in the West and I was assigned to a project called land for returning soldiers. Dr. Elwood Mead was the man at the head of the study, and we made a study in Canada about the possibilities of the use of these resources for the returning soldiers.

That had a relation to Boulder Dam, and on this Boulder project, likewise, I had a relation to the Department in many phases of its conservation activities. I was appointed in early 1933 as a personal assistant to Secretary Ickes, also as an assistant when Mr. Ickes was Administrator of the Public Works Administration. I was made Under Secretary of the Interior in 1938, and served until the President appointed me in 1939 as Administrator of the Rural Electrification Administration, succeeding Mr. John Carmody. Mr. Morris L. Cooke was the first Administrator.

I have given that background so you can see that I have been familiar with the relation of these great resources and the Government, and I know in general terms of the great possibility of scientific effort in many departments of the Government.

Senator KILGORE. Mr. Slattery, I have had some interesting experiences with reference to scientific governmental agencies and the influence they have with the people; and one thing is clear, that the operating companies have always been against Government scientific development. Even the agricultural research was fought vigorously at first.

In a hearing in which I participated there was a finding by a board, supposedly nonpartisan, which was being bitterly contested. I said to an outsider, "What is the matter, this is a subject that the Bureau of Standards could pass on," and the answer was, "If the Bureau of Standards ever passed on it, we would have no objection, because we believe the Bureau of Standards fully."

They knew that they would get the truth from the Bureau of Standards. That attitude is general in regard to the old-established agencies.

Mr. SLATTERY. I would like to put in a word on scientific effort by the Government, whether in agriculture, by the Bureau of Standards, or in any of the so-called old-line Government organizations. I think the men in scientific and research work have made a great contribution and have often devoted their lives in the service. It is very easy for people to talk about bureaucracy and all that, but they overlook great contributions by our old-established agencies in scientific research and inventions and studies, great aids which have been given to the economy of the Nation.

Senator KILGORE. It is an interesting thing that the public generally accepts the work of the established agencies and accords them the confidence that they deserve.

Mr. SLATTERY. I now come to rural electrification and, as Administrator of the Rural Electrification Administration, I think I can speak with a certain amount of knowledge.

Digitized by Google

In addition to my other Government background, I went abroad and saw some of the projects being established in the field of cooperatives in other countries, and I know of many scientific efforts that they have made. It may please you to hear about some of them. I testified before the O'Mahoney committee about a year ago and put into the record some data which might also be helpful here, which indicate very definitely how, for instance, Hitler, who knew what he was going to do, early launched an effort fully to electrify Germany, and Germany today is probably electrified 90 percent. Hitler knew he was going to take men off the farms, so he had a plan whereby, in 1935, he put through his own order—I think it was for 500,000,000 marks—which was to be disposed of for various electrical gadgets to help in the war. I have the details of that information. I have talked to a great many people back from Germany, I have gone through a lot of consul reports and various other books bearing on the subject, and they have no doubt highly electrified Germany. Hitler went to the extreme in using electricity, you might say. Mr. Leland Olds testified before one committee that Hitler used a great many of small water-power sites. When he would go into a country, one of the first things he would do was to begin to convert power sites and steam plants to his own benefit; and he highly electrified the small industries.

I bring that up because I was on the National Council of Defense when it was first appointed by the President and we had information then about those small industries, and we made a study and put it in the record. Mr. M. M. Samuels, Chief of the Technical Standards Division in R. E. A., made an investigation indicating that there were about 5,000 small industries in our country that had gone on the R. E. A. lines up to the time the study was made.

I heard Mr. Ellis' testimony about the unelectrified farm survey being made in R. E. A. The entire findings will be made public when the survey is completed and the possibility for future development for rural electrification is known.

As you know, of course, the War Production Board about a year ago prevented further construction of R. E. A. lines. Since that time there has been a modification of the Board's order, but there is no question about it but this country has only partly been electrified and I think in the electrification of small industries there is a great future. I know there is great possibility in the electrification of rural communities.

That brings up the whole question of labor-saving devices, which I think are practically in their infancy now. There are many possibilities for all kinds of devices that will help the farmer. We know that such devices as pig brooders and chicken brooders come into the war picture now and the fight for the increased production of meat. There are other things like refrigerators and dehydrators, all of which are of tremendous importance.

In that connection, I want to say that last year I went about 24,000 miles in a visit to many of our cooperatives. I think I saw most of the American picture, and I can say that one thing R. E. A. has made in the way of a contribution to the war picture is the manpower savings by electric aids. In addition, of course, there is no doubt but that the preservation of food by electricity under the increased need for food is making great progress.

Digitized by Google

A few years ago no one knew anything about dehydration and did not know much about pig or chicken brooders of the electric type. Of course, many farmers had the old-fashioned type, and a lot of them are still being used, but the new electrical aids were practically unknown.

They have certainly added tremendously to increased food production and have been a great factor in bringing up the efficiency of American agriculture

There is a small unit in R. E. A. which was begun under Mr. Morris L. Cooke, the first Administrator, which you might say is a technical division to make scientific investigations. They have worked with other groups here like the Bureau of Standards, and they have worked in many cases with private companies. There is no doubt about it, the private corporations have great laboratories, highly skilled engineers, and experimental plants to work with. Those plants and laboratories have brought a great many aids to the farmer along the lines of modern agriculture.

I spoke recently in New York on the General Electric radio station at Schenectady. I previously had some correspondence with the then president of the General Electric, Mr. Wilson, who is now here in the War Production Board. I said to Mr. Wilson that they did not give information about the great work that the Rural Electrification Administration was doing, did not give it to the public. Finally word came back to me that "we will give you a spot to explain R. E. A., we will put you on our radio." I went to Schenectady and spoke on the General Electric station. While I was there, their officials took me through the General Electric laboratories. I could see that they were doing research work for the future and I was privileged to look into some of their greatest works and know how they are laboring for the future.

I do not know whether you know of it, but during the Hoover administration he had what he called a bill for a Pure Science Research Bureau. I think it had an appropriation of something in the neighborhood—which looked very large in those days—of $500,000,000. I think the National Academy of Sciences people were partly back of it, and Mr. Hoover many times urged that there should be a far-flung research bureau by the Government that would carry forward the great possibility for public research, not to help the great corporations privately, but in the public interest. I have thought that there was a matter of great possibilities, and if I read your bill rightly that it is somewhat the idea back of it. I know that in the future of rural electrification there are all kinds of possibilities. We try to do the best we can but we have only a handful of men and we have only a very small appropriation. We have three or four young engineers who have made great contributions to the carrier system which we perfected on the R. E. A. lines. Those young men are now in England. With the advance of electronics and other developments of communications, they are making a fine contribution to the war. The R. E. A. has constructed a network of lines, around 400,000 miles, which is quite a sizable network. We streamlined rural electrification. I am not clashing with the private companies on it, but I do not think that they did much rural electrification in the early days. One thing the R. E. A. did with this streamlining, it brought the cost of construction down. The construction of electric rural lines used to be about $1,500.

Digitized by Google

R. E. A. brought the cost down to around $750. That made possible the aid of rural electrification to parts of the country that probably never could have otherwise received it.

Senator KILGORE. Mr. Slattery, in that connection a merchandising executive of wide experience recently said to me that one of the most dangerous results of the present war would be a monopoly on the inventions on electronics, by a Government agency, in private hands.

Mr. SLATTERY. I have seen the great advance of electronics. I saw the General Electric's laboratory and know of the Weshinghouse activities. I have read enough about it to imagine that many wonderful things will come out of it. I think back to the time when with Congressman Rainey, of Illinois, in 1914, I helped to draft the bill which was to create a Bureau of Agricultural Power in the Department of Agriculture. I remember in 1912 Congressman Rainey put in the record for me a speech that I called Power and the Future. I had come back from a trip to Ontario, seeing the advances there, and had come back by Schenectady and saw and talked with Mr. Steinmetz who was a member of our conservation committee. Under his imagination of the great future of the then high-tension systems, and the other advances of electricity which we had not reached, I used in that speech some of his ideas upon the future promises of electricity. In that speech, I dwelt on the great future possibilities of electricity and its domestic labor-saving possibilities. Many of the things that I covered, which were then almost figments of the imagination, have come into being today.

Senator KILGORE. Those things are disproportionately high priced, though, even today.

Mr. SLATTERY. I think they are; yes sir; but I think the great possible future of these aids in more production will make them in the reach of everyone. I know that we all can go back to the early days on the farm, with no pump, no aids of any kind, with kerosene lamps. Then look today at the modern electrified farm and realize that a lot of these gadgets cannot be brought to the farm people because they do not fit into their budgets. Certainly the prices have been coming down, but not as much as they should, in my opinion.

It seems to me that electricity on the farm is one of the great things that we need. I think of Mr. Edison and a statement that he made one time when he spoke to a naval consulting committee in the First World War on the subject of electricity. He said that he thought it was a blessing from the throne of God, what it had done for modern life.

Senator KILGORE. Mr. Slattery, I sometimes think that we exist as a nation because of an overdose of royalty in the Government in the mother country; and I believe we are suffering now, and have been for some time, from an overdose of royalty in business.

Mr. SLATTERY. I do not know whether you have read a speech Mr. Leland Olds made at the T. V. A. meeting only the other day. I think it was an unusual speech, because he put forward the idea there that there was such a thing as a danger of bureaucracy in business.

In the early days of electricity in this country many of the great patents and inventions in the electrical industry were developed by some individual genius. Then some of these men made efforts to give these patents to the public, knowing the great blessings they were. But later the things got into the hands of the great electrical industries.

Digitized by Google

Senator KILGORE. I was informed recently that Mr. Higgins, of New Orleans, has endeavored and finally succeeded in giving to the Government a patent on a torpedo tube which is supposed to be a very fine one, and one of the big factors in the gift was that he limited the profits on manufacturing by any manufacturer to a definite percentage, doing away with all royalties; and that did not seem to meet with great favor on the part of the manufacturers, but in fact met with terrific sales resistance.

Mr. SLATTERY. You know about the Babcock separator. I used to know Dr. Babcock; he was one of the typical Government scientists. He gave his separator to the Government, and what it has meant to the farmers of the United States hardly anyone could estimate.

My work with conservation often brought me into contact with cases where great inventions, processes, and other aids to conserving resources like oil and coal, and so forth, were discovered by individuals in the Government, and then finally showed up in the hands of private, profit-taking organizations.

We have had a good many inventions made by the personnel of the Rural Electrification Administration with reference to rural electrification. They have all given their patents to the Government, and we have had to have a lot of correspondence with the Department of Justice about the matter. I want to tell you frankly that it is not an easy thing for these men to give their inventions to the Government.

Senator KILGORE. No; it is not. It is the hardest thing in the world to protect the rights of the people. That is largely brought about by the decentralization in planning so that an appropriation to agriculture can be used only for that purpose, and if they develop some valuable side line that does not affect agriculture, they cannot go ahead with it. There is no centralized agency that they can appeal to, to turn over an idea to, or get funds to go ahead with the development. They can proceed with it only if it is for the benefit of agriculture. That type of decentralization is against the public interest and places those things into the hands of the patent pool.

Another thing, there is no central agency to defend the Government's patents, to decide whether they are being infringed on, or to handle the licensing of the actual manufacturing.

Mr. SLATTERY. I heard a speech at the annual meeting of the T. V. A. recently which was most unusual. One of the speakers told of some of the possibilities in the new day of electricity. He said that we will probably have houses without windows that will be warmed in the winter and cooled in the summer from one electrical device, and the speaker referred to a gadget in the houses that will produce purified air so that no one will have any trouble with hay fever or with insects.

This new electrical home will have provisions for food storage, food preservation, and cooking by electricity. All in all, it is a very unusual story, and, of course, I think you can assume that all of those wonderful things of electricity will be made applicable to everyday life. I hear every once in a while of some new invention made on the war front. Then I can see that these same inventions can be applied to domestic life in bringing about a change in the domestic economy that will bring a new day.

Senator KILGOFRE. Westinghouse, I believe, has an air purifier that, if it were to come into general use, would practically eliminate suffer-

Digitized by Google

ing from asthma. At this time it has not yet been placed on the open market, although I saw it in operation in about 1935. It was a small outfit—I do not think it could be so tremendously expensive to build—and you just set it in a room, and it takes all impurities out and leaves only pure air.

Then, also, there is the use of the ultraviolet rays for purifying. I know today many of the cafes use ultraviolet rays on drinking glasses. They bring glasses out from under that treatment absolutely germ free.

Mr. SLATTERY. I was going to say I would like to present portions of two talks, one by Mr. M. M. Samuels, Chief, Technical Standards Division of R. E. A., and part of a talk I made to the St. Louis section of the American Society of Civil Engineers.

Senator KILGORE. We would be glad to have them, sir.

Mr. SLATTERY. I think the R. E. A. engineers and technicians are making a great contribution along the line of study and investigations as outlined in Mr. Samuels' paper.

Senator KILGORE. We will be glad to receive it.

(The material referred to was marked "Exhibit No. 8" and "Exhibit No. 9" and follows:)

EXHIBIT No. 8

RURAL ELECTRIFICATION ENGINEERING AND ELECTROAGRICULTURAL ENGINEERING

[Excerpts from a paper presented by M. M. Samuels under the auspices of the Committee of Domestic and Commercial Application before the American Institute of Electrical Engineers, national technical meeting, New York City, January 1943]

We now come to electroagricultural engineering. When the statement was made that there was no electroagriculture, it was not meant that no one ever used electricity on the farm. And when it was said that there was no electroagricultural engineering, it did not mean that no engineer ever tried to apply engineering to the use of electricity for farming. Again, it was meant that as yet there is no specific branch of engineering that could be called electroagricultural engineering and there was no specific industry that could be called electroagricultural industry. As a matter of fact, these things are so new that it is difficult to say now what the subject of the first chapter of electroagricultural engineering should be. Even this will have to be developed as we go along. No more will, therefore, be said here about the engineering possibilities, and the discussion will limit itself to the industrial possibilities. Here we know of some definite needs, and this is addressed primarily to progressive American manufacturers who look ahead, find out what will be required, and proceed to build it and put it on the market.

Electroagricultural engineering is closely associated with rural electrification engineering, because, for example, the grounding problem is probably more important in connection with the fire hazard on the farm than in the city. A faulty ground may cause a fire; and when a fire starts on the farm, the results are frequently disastrous. A simple, cheap ground meter, suitable for the convenient use of every electrician, should be developed. Incidentally, the study of lightning protection of farm buildings and perhaps the development of more competent equipment for this purpose likewise invites some activity on the part of the electrical manufacturers.

While we are on the subject of hazards, we may as well consider the electric fence, which is important in wartime because less critical material may be used. The diversity of the types of control on the market is so great as to be bewildering, and many of the types are definitely hazardous. A committee of the National Electrical Safety Code has been engaged in the study of this subject, but before quantity production is possible some work by an American Institute of Electrical Engineers' committee and a National Electrical Manufacturers' Association committee will no doubt be in order.

When large-scale rural electrification started, all efforts were concentrated on bringing into the farm the minimum amount of civilized comfort, such as electric

Digitized by Google

lights, radio, a flatiron, a water pump, a washing machine, perhaps a hot-water heater, and here and there an electric range. This was as it should have been. The activity should continue, and improvements should be introduced. Illuminating engineers should study the problem of lighting for the farm, the farm home, the farmyard, the barn, etc., and the specific requirements of the circuit. This should possibly be made a project by the I. E. S. Lighting problems on the farm are different and call for different treatment.

An important item of comfort that manufacturers should devote their attention to is the development of a small, cheap but very reliable water pump to make it possible to bring running water into the poorest farm home. I consider this to be as important as the electric light. Public health authorities are unanimous in their opinion that running water in every home would reduce sickness in the countryside.

Recently there has come about a realization that every effort should be made to develop equipment to make it possible for the farmer who has electricity to use that electricity for real farming, to get more revenue out of his farm, to produce more or better food, to preserve food, and to make it unnecessary to let good food go to waste. This is real electroagricultural engineering. As was brought out in the paper referred to above, some wonderful work has been done along this line by men of science in the colleges and other laboratories, but it has not been possible as yet to make the result of their labor available to all the farmers in the country, because there is as yet no specific industry to manufacture the items as quantity production. There is already some evidence of the beginning of such an industry. What has already been done only helps to demonstrate what we may expect in the future when a real electroagricultural industry is established using quantity production methods for making low-cost but reliable equipment that the small farmer can use to get a little more revenue out of the electricity that he already has or will have. Most of the items already on the market are too expensive for the small farmer. They are intended for the more prosperous farmer, and our main interest should be to make the small farmer more prosperous.

At various times individuals have endeavored to list the electric equipment and appliances suitable for both the farm and the farm home. Some of these lists exceed the 350 mark. State agricultural colleges, the United States Department of Agriculture, and others have been responsible in large measure and worked exceedingly hard for many years on the research and development of electric applications. It must be said that very few of these have found their way to the farm in large numbers. It is most difficult to get one's teeth into the real meat of these applications, for, although much work has been done, yet little specific information, either on statistics or accomplishments, has been assembled. At first thought this seems strange, because so many of these can be cataloged as income-producing equipment which has been proven profitable to the owner.

Nineteen forty-one has been an exceptional year in manufacturing and the sale of all farm equipment, electric and nonelectric. It exceeded in volume any previous year, and the sales value of it was 36 percent greater than 1940 and 34 percent above the high mark set in 1937. Electric farm equipment sold for both the years 1941 and 1940, and the increase in favor of 1940, are shown in the accompanying table.

Electric farm equipment sold [1]

	1941	1940	Increase	
			Number	Percent
Milking machines	53,463	33,930	19,533	57.6
Cream separators (hand or power operated)	138,785	105,254	33,531	31.8
Milk coolers	13,143	9,134	4,009	43.8
Domestic pumps and water systems	360,412	267,972	92,440	34.5
Brooders	111,689	91,340	20,349	22.3

[1] Source: Manufacture and Sale of Farm Equipment, Bureau of the Census, U. S. Department of Commerce.

It will be noted that the electric equipment manufactured and sold in quantity is confined to a few items. Those assembled and released by the Bureau of the Census include only milking machines, cream separators, milk coolers, domes-

Digitized by Google

tic pumps, water systems, and brooders. It should be remembered that the figures shown are for years when the sales of these units were exceptionally high. Considering this fact it is obvious that with over 2,337,160 farms electrified we still have a long way to go to reach saturation of this group alone. We will not reach it until we have a specialized industry with quantity production. Even on dairy farms where electricity can be used in so many ways it has been shown on an average that only 10 percent of the connected load is used for farming operations; the other 90 percent is used for lighting, household appliances, and water pumping. The former figure is exceedingly low when we think of electric service as being used to increase farm production and income.

An electric motor-driven cream separator will cut the time in half as compared with doing it by hand. For the larger sizes it is now a one-man instead of a two-man job.

Records of 25,000 acres in the State of Oregon which were irrigated show a gross increase of $40 per acre over nonirrigated. Although irrigation is practiced in every State of the Nation, yet today it is only in its infancy in the humid regions.

Individual farmers report savings up to $100 per year by electric feed grinding, but here too we cannot as yet speak of general use of electric-feed grinding on the farm.

Numerous other activities could be quoted where electricity has been successfully used on the farm. But anyone who has had a chance to see the fine research work being done in the various colleges will at once realize that the surface has not yet been scratched, and that manufacturers will find a ready market for many items now in the development stage in the colleges or in the minds or the cellars of individual inventors. Until recently there was very little incentive for manufacturers to spend money on the development of new devices for the farm. Such new items are hard to sell, they are expensive to sell. Farmers are far apart from each other and the very sales effort required for introducing a new item on the farm makes the cost of the article in many cases prohibitive. The Rural Electrification Administration cooperatives use a group purchase system, and they can arrange with manufacturers to cover a quantity purchase by one agreement. Since November 1939 the Rural Electrification Administration cooperatives purchased most of their meters under the group purchase plan, totaling about 4¾ millions of dollars, to the satisfaction of both the consumers and manufacturers. While all the service transformers for new construction have been furnished by the contractor, the cooperatives used the group purchase plan for securing close to 25,000 transformers for extensions, totaling nearly 2½ million dollars. Quite a few other items have been successfully handled through the group purchase plan, making it unnecessary for the manufacturers to try to sell a new item from house to house.

It is important to realize that whatever is manufactured for the farmer must be low in price, rugged and simple in operation. Only quantity production can bring about such devices.

It is gratifying to be able to report that there are quite a number of progressive American manufacturers who have been giving this matter their careful attention and have been spending considerable sums of money on development of many devices that are suitable for quantity production.

One manufacturer developed a self-contained quick-freezer and cold-storage unit having a capacity of 20 cubic feet, which means that it will hold about 1,000 pounds of meat or 500 pounds of fruit or vegetables. It is sufficiently small in dimensions to be accommodated on the back porch of the house, and it is estimated that on a quantity-production basis it would cost less than $300. There is no question that there is an enormous market for such an item.

Another manufacturer, to make it possible for the farmer to grind his own whole-wheat flour and cereals, making it unnecessary to ship his wheat to the factory and then get it back again in the form of flour, developed a small kitchen-type flour mill weighing 25 pounds and able to grind 20 to 40 pounds of flour per hour. The cost of this little mill based on quantity production will not exceed $25, and it is hoped that eventually it will have an attachment so that the standard makes of mixer attachments in the kitchen can be attached to the mill without the necessity of buying a mixer. But this, along with the freezer, had to be put to sleep temporarily on account of the war.

Dehydration is another very important item. We know, of course, that there is a great deal of commercial dehydration going on in this country and that dehydration made it possible to send enormous quantities of food abroad which

Digitized by Google

otherwise could not have been sent. But two problems on the farm are as yet unsolved. First, everyone who has traveled through the country knows that enormous quantities of apples, peaches, and some vegetables go to waste because the farmer cannot afford to harvest them. Second, it should be made possible for the farmer to dehydrate such fruits and vegetables for his own use. A small kitchen-type dehydrator would solve these problems. One progressive manufacturer developed a small dehydrator weighing less than 100 pounds and being 28 by 20 by 23 inches in dimensions. This little dehydrator does not call for special wiring because the consumption is so low that it can be attached to the house circuit. It can produce in 12 hours 4 pounds of dehydrated apples from 25 pounds of apples, and consumes only 2.4 kilowatt-hours per pound of dehydrated apples. This item is likewise kept in abeyance due to the war.

These are outstanding examples of the difference between home-made equipment and manufactured equipment. Numerous types of dehydrators have been designed by various schools and the designs have been sent to the farmers advising them to produce those dehydrators themselves. It is not necessary to dwell upon the fact that during this critical wartime manpower on the farm is now very scarce and that the farmer has no time to devote to the production of mechanical equipment, but even in peacetime very few farmers would be interested in producing such a device if a better commercial product were available at a reasonable price. Besides, all of the designs for home-made equipment show electricity consumption much greater than the one proposed by the manufacturer. Some of the home-made dehydrators require as much as 5 kilowatt-hours per pound of dried apples as against the 2.4 kilowatt-hours that the manufactured equipment would require. There is no question that there is a market for hundreds of thousands of such small dehydrators if produced in quantity, of high quality and at a low price. The estimated price of this particular dehydrator is about $36, based on a quantity of 5,000. But other manufacturers are likewise working on the development of a small dehydrator and no doubt when the market opens up the price will be lower.

The matter of chicken brooders is something for manufacturers as well as for an American Institute of Electrical Engineers committee to study. Here, too, the number of designs is so great as to be bewildering and make it difficult for a farmer to select the type of brooder he should buy, to say nothing of making one himself. It should be possible now to crystallize a small number of standard designs that will meet all the requirements of the various agricultural schools and individual farmers and prepare some definite specifications under the auspices of A. S. A. This, and only this, will make it possible for reputable manufacturers to go into quantity production of brooders and for the farmers to get the best brooders for the lowest price.

Some studies have been made on soil treatment by application of electricity, and there is a beginning of promising results. In one case, for instance, electrical soil treatment eliminated entirely the wild morning glory (bind weed). In another instance, a better-quality flax was produced after the soil was treated with an electrical process. This, too, should be studied by manufacturers with a view toward eventually producing standardized equipment for electric soil treatment. Experiments have been carried on to use electric light for the control of the European corn borer. You know, of course, what a pest the corn borer has been. I have been told that in some parts of the Corn Belt farmers have stopped raising sweet corn solely on account of the corn borer. These experiments likewise had to stop because the one who was outstanding in this work is now in the Army, but the work should be picked up again and standard equipment should be developed that could be sold to every farmer who raises corn.

Some research men have been working on the development of a small pasteurizer for the small farm that could be had at low cost, and the prospects are very promising. This work should have the attention of electrical manufacturers. It should be made possible for the small farmer to pasteurize his milk and sell it to the community and thus save a great amount of transportation.

The possibility of a storage-battery-driven electric tractor has not yet been exhausted. Some experiments were made prior to the depression but were dropped. It is difficult to predict whether or not such a tractor would be a success. It is possible that if the cost of energy for charging the batteries at night is very low a market would be opened for small tractors to be used by hundreds of thousands of small farmers.

There is a decided need for simplification of motor starters for medium-sized motors for farm use and also a reduction in the price of the starters.

Digitized by Google

When the war is over a great deal will be known about high frequencies that is not now known, and it is possible that high frequencies ranging from audio frequencies to ultra-high frequencies may have a great many applications on the farm. It may be possible to apply high frequency for soil treatment, and supersonic waves may possibly be applicable for extermination of pests. This subject calls for much more study by electrical engineers.

EXHIBIT No. 9

THE ENGINEER'S PLACE IN PUBLIC LIFE

[Excerpts from a speech by Harry Slattery before the St. Louis section of the American Society of Civil Engineers, April 27, 1942, St. Louis, Mo.]

Some time ago I expressed surprise that in spite of the great contributions by engineers to the development of the country there is no monument for any engineer in the city of Washington. One of the engineers on my staff said "How about the Washington Monument? Washington was an engineer." I replied that Washington was not really an engineer—he was a land surveyor. So you see that I even know the difference between a civil engineer and a land surveyor.

I don't think that the absence of monuments for engineers is due to the engineer's modesty. Engineers are no more modest than anyone else. It is probably due to the fact that, while the great structures conceived by engineers are spectacular, the engineer himself is not spectacular, because the public really never sees him in action.

I also know that civil engineering is both the oldest and broadest branch of engineering and that every engineer, to be an engineer at all, must know a little something about civil engineering. Civil engineering is still the foundation for all engineering. However, all this does not qualify me as an authority for presenting a paper to you on a technical subject. I am assuming therefore that you expected me to select a subject which is most familiar to me. This I have done.

What then is the engineer's place in American public life? Just now I may say that it is important for engineers not to exaggerate it. Just now we are engaged in a mechanical war, a machine war. Engineers are more in demand by the armed forces than anyone else. Many engineers have left by own staff in Rural Electrification Administration and joined the Army, the Navy, and the Marine Corps, practically all as commissioned officers. This applies both to older, experienced engineers, and the very brilliant young engineers who are fresh from school and are thoroughly versed in mathematics and physics. We have contributed an unusually great number of young engineers to the Signal Corps, each having an individual responsible mission. We also lost many engineers to private enterprises who temporarily pay more than the law permits us to pay. So even in my position as an administrator, who is not an engineer, struggling along the best I can to do the job entrusted to me with a curtailed engineering staff, I have to guard myself not to exaggerate the importance of the engineer in public life and at the same time give him full recognition for what he is and what he can do.

As a citizen he has the vote and he can run for public office like anyone else. As such he functions as a citizen and not as an engineer. He has the same rights and the same duties that everyone else has. He can be drafted in the Army like anyone else, with the possible advantage that he will more likely get a commission than anyone else. He can and is now and then appointed to responsible administrative office in the Government as is now and then a lawyer like myself, a professional Army officer like General Fleming, a philosopher like Henry Wallace, or a businessman like Donald Nelson. But when I, a lawyer, was appointed Administrator, I was not appointed to practice law but to administer an important Government business. So, too, when an engineer is selected to administer an important Government undertaking, he is not appointed to practice engineering, but to administer an important Government undertaking.

So you see what I am driving at. When I speak of the engineer in public life I do not speak of his extra-curricular activities but only of his engineering activity. And so the answer becomes quite simple. The engineer in public life should be an engineer. It is a big enough responsibility for anyone. The engineer in public life is responsible for the physical structure of public life. Whether it be civil engineering or any other branch of engineering, he has five distinct functions.

1. *Conception.*—Some must first conceive the idea that a certain engineering activity is required, be it a public highway, a river and harbor development, a

Digitized by Google

power development, a flood-control project, a navy yard or Army camp. This conception may or may not first appear in the mind of an engineer. It may appear in the mind of a great dreamer, a great idealist, like Theodore Roosevelt or George Norris. But as a rule the complete conception cannot be crystalized without the engineer. And here is perhaps one of his most important functions. He must be unbiased. He must not be influenced by either political, economic, or social prejudice. He must inject only the unbiased engineering viewpoint.

2. *Investigation.*—Once there is a conception, a complete engineering report, based on an engineering investigation, is called for before those responsible to the people can decide whether or not a project should be executed. Here the engineer must again show his lack of bias. There may be other considerations than those of mere engineering economy that may determine whether or not a proposed public undertaking should be carried out. There may be reasons of national defense, social reasons, educational reasons, and numerous other reasons of public policy. But the engineer should limit himself to a concise and unbiased engineering report, so presented that an executive who is not an engineer can decide for himself whether or not he should assume the responsibility for authorizing the project. I do not mean that all engineering mathematics should be so presented that the layman can understand them. But the presentation should be so that if he believes the engineering computations to be correct he can render a decision. If he desires to have the engineering computations checked, he should be able to turn them over to another engineer for checking. All unknown factors and all assumptions should be clearly stated, as should all sources of information. An engineer should be able to check another engineer's work without asking the other engineer any questions or even after the other engineer is dead. This feature cannot be overemphasized in public life.

3. *Design.*—After the investigation is completed, the project approved, and the money authorized, the final designs and specifications for construction must be prepared. I know that this is a more difficult job in public life than in private life. The engineer in public life must be less arbitrary; he cannot specify devices or methods controlled by a monopoly. He cannot specify patented devices. He cannot be as definite in his specifications as he can be in private life. It is more difficult for him to make sure that the contractor will use the best methods and the best materials. This, in my opinion, is a problem in government that has not yet been solved. It will have to be solved some day. The Government of the United States is the only authority that can issue patents, and yet the Government finds itself forced to prohibit its own departments to specify definitely some patented devices and methods and thus perhaps makes it imposible for public engineering to take advantage of the latest developments. But such rules and regulations become absolute necessities to avoid abuses. The problem is how to make it possible for public bodies to specify definite materials and methods without opening the door wide to abuses and without being accused of favoritism or discrimination. This is perhaps one of the most important problems for engineers in public life to solve. I know that engineers alone cannot solve it. But they can and should create suggestions.

4. *Construction.*—I guess I need not tell you civil engineers anything about this feature of the engineers' activity in public life. I merely wish to say that great opportunities lie ahead of you. I will only mention waterways. There is an enormous job to be done, and here in St. Louis there should be more interest in it than anywhere else. I can visualize this city, if all waterways are developed as they should be, as the crossroads of America. Your water-front improvement, like that of Chicago or Washington, is an engineering job.

5. *Operation.*—The only thing I can say here is that it is of great importance for those engineers who remain in civilian life during the war, handicapped as they are with lack of repair and maintenance materials and lack of skilled labor, to do all they can to prevent the great public works that are not directly war works from decaying. It is a difficult job, but engineers are used to doing difficult jobs.

I have barely mentioned the war. You all know your responsibilities as engineers in the war. You have to carry a great burden in this war, perhaps a greater burden than any other profession with the possible exception of the medical profession. But I want to say a word about post-war. Engineers are now very much in demand, in the Army and Navy as well as in civilian life. An engineer does not have to look for a job now: the job is looking for him. But what is going to happen after the war? What is going to happen to the engineers and the workmen now directly or indirectly engaged in war work? Will they all be out of a job? If they are, this is not America and we are fighting

Digitized by Google

for nothing. It cannot be permitted to be. I wonder if many of you have read Stewart Chase's recent book on Post-War Solutions? He puts the solution in the hands of that real pioneer of getting things done in the world—the American engineers. I have been in public life a long time and I am qualified to tell you that the building of America is by no means complete. My conception is that the building of America should really begin after the war. There are the great waterways to be built; there are homes to be built so that every American can, as he should, have a clean, decent, civilized place to live in. There is sanitation of the highest level to be established for everyone. And, as the Administrator of the Rural Electrification Administration, you will permit me to conclude with: And there is rural electrification to be broadened so that every American in the remotest place not only has a decent place to live in but has the benefit of electric light, running water, radio, and all the numerous advantages that a civilized American is entitled to have. Until this is done America is not yet built up. America is not yet civilized. This is something for all engineers to think about and to look toward a great post-war activity for the engineer in public life.

Mr. SLATTERY. I would like also to include a letter in the record.

Senator KILGORE. All right.

(The letter was marked "Exhibit No. 10" and follows:)

EXHIBIT No. 10

APRIL 9, 1943.

Senator HARLEY M. KILGORE,
Senate Office Building, Washington, D. C.

MY DEAR SENATOR: I am grateful for your kind invitation and your statement that my life-long advocacy of the problems that your science mobilization bill (S. 702) seeks to solve make it important that my views be presented to your committee today.

It is true that my whole adult life has been devoted to the cause of conservation, electric power, and scientific research and development in the interest of the common people of America. The struggle has been a long and hard one, but I can now see that it has not been in vain, and great accomplishments are clearly seen for the future. I keenly feel that one of the drawbacks in the past has been the lack of such an organization as you propose to create.

I am particularly interested in those features of the bill that would break monopolies. To me this is no new subject. I feel that the rural people of America suffer most from the monopolistic practices of some interests in this country because they are always the last to share in the benefits of modern development. Their burdens have not been sufficiently eased by modern science. The Power Trust has woked particularly against the interest of the rural dweller. Scarcity of materials is now impeding the expansion of rural electrical development, and it is my feeling that this bill will provide for more orderly use of the Nation's resources and thus minimize these scarcities. The office of scientific and technical mobilization, as envisioned in the bill, would provide for the development of new sources and substitute materials. The high cost of meters, electrical fixtures, and other equipment necessary to the maintenance of a farm have made it impossible for the small farmer to keep abreast of the country's development. The structure envisioned in the bill would, I feel, cure this situation.

Another great lack for the small farmer has been adequate food storage and refrigeration facilities. The office of scientific and technical mobilization would provide for their development. Heretofore our Rural Electrification Administration and other agencies set up to serve the rural population have been dependent upon the manufacture of electrical equipment for new products. This has been difficult because the manufacturer did nothing to disturb his price structure.

The farmer's prosperity is dependent in large measure upon the quality of local industry. It is implicit in this bill that decentralization of industry is intended. This would provide close and ready markets for farm products and their by-products and would obviate the necessity for intricate transportation systems.

I have pointed out only a few of the ways that this proposed legislation can help the rural people of America. These, I think, are obvious from a cursory examination of the bill. I hope that when I appear before the committee I will be able to bring out the many other benefits which I am sure are inherent in this measure.

Thank you again for calling on me in this connection and please accept my sincere congratulations for your work in the interest of the American people.

Sincerely yours,

HARRY SLATTERY.

Digitized by Google

Mr. SLATTERY. Now, Senator, I would like to come back to a point I wanted to make. It is very clear that, as a Government man, I have certain limitations on my expression about the Government and the war and post-war.

Senator KILGORE. I can appreciate that.

Mr. SLATTERY. I think it is perfectly evident, however, that the things which are developed by men who are paid by the Government should remain with the Government, and when they are used to enrich someone else it seems to me to be a violation of the whole ethics of the Government service.

I would like to close by saying that the Rural Electrification Administration has great hopes for the post-war period. As I said a minute ago, I went through the days of the last war with Secretary Lane, when we were able to do a certain amount of good work with and for the soldiers who returned.

I think, if you will look back to the Civil War period and consider how the men who came back built the transcontinental railroads and other public works, then today's rural electrification problem seems—to use a good term—a "natural." We have hundreds of projects which are held up on by the wartime limitation of materials. We have those practically processed, and in the post-war era they will give a great deal of employment. It will be a public-works program in a real sense, and the men who will come out of the Government service trained as electrical engineers, mechanical engineers, and chemists will have a great field of endeavor opening up for them.

I assume you have seen the report of the National Resources Planning Board which recommends rural electrification as a possibility.

Senator KILGORE. I think that one of the most pitiful episodes of the whole period of the First World War was the picture of the man in the service being handed $50 and turned loose to hunt a job at the end of the war.

I was in Detroit after the last war and saw a park in front of the Detroit Free Press Building simply covered with discharged soldiers sleeping on newspapers that the Detroit Free Press gave them to sleep on. The shelters were all filled with men hunting jobs. It is my hope, and I know also President Roosevelt's hope, that we will be able to do some planning so that when this war is over a man will be discharged from the Army to accept a job, and we will avoid that horrible year of readjustment which we went through after the last war, a year which was fraught with suffering and pain in the United States.

And in this electrification program and various other programs that the Government is building up, it is my hope that it will give the smaller plants work to do.

Mr. SLATTERY. Senator, along that line, I can say that Rural Electrification Administration has spent about $500,000,000, and you have seen in your own State how the effects of the Rural Electrification Administration and its program are widespread.

Senator KILGORE. It is unfortunate that we have not been able in my State to take advantage of it, because of certain conditions which existed. The present Governor is heartily in sympathy with the program, but in the past that policy was not always followed by the State administration—even where there was no conflict with any utility company and where it would be a self-sustaining thing.

Digitized by Google

There were vigorous fights to make the program comply with little trifling regulations which did not fit the situation and all that type of thing.

Dealing with the company in which all the stockholders are also purchasers of its service is a little different from dealing with the company where the stockholders are not the consumers.

Mr. SLATTERY. We have received word from the Canadians, in Manitoba, and Ontario, and we have received a letter from Australia to the effect that they are very definitely going all out on the question of rural electrification in the post-war period.

They have made surveys and have a rather elaborated program for it.

Later on we will have a good deal of definite information from the electrified-farms survey, which will be a very complete survey made by engineers, not a horseback survey but a very thorough one.

Senator KILGORE. Mr. Slattery, I wish you would furnish us for the record the results of any surveys which have already been made by your organization on the number of unelectrified farms yet to be electrified and the number that are now electrified.

Mr. SLATTERY. I will be glad to, sir.

(The tables referred to were marked "Exhibit No. 11" and filed with the committee.)

Thank you very much.

Mr. SLATTERY. Thank you, sir.

Senator KILGORE. Mr. Tynes is the next witness.

STATEMENT OF FINLEY TYNES, SECRETARY-MANAGER OF THE STAUNTON AND AUGUSTA COUNTY CHAMBER OF COMMERCE, STAUNTON, VA.

(Mr. Tynes was duly sworn as a witness by Senator Kilgore.)

Senator KILGORE. You are Mr. Finley Tynes, secretary-manager of the Staunton and Augusta County Chamber of Commerce, of Staunton, Va.; is that correct?

Mr. TYNES. That is correct, sir.

Senator KILGORE. We are glad to have you here today.

Mr. TYNES. Senator, I am not one of these old-line chamber-of-commerce secretaries who is a showman. I am a workingman and not used to making speeches or appearing before committees. I have prepared a few of my own opinions, and the opinions of some representative business groups, and with your permission I will read them rather than make a statement otherwise.

Senator KILGORE. You may do that, sir, and we may ask you questions as you go along.

Mr. TYNES. That is perfectly all right.

My name is Finley Tynes. I am a native of Staunton, Va., where I am now secretary-manager of the chamber of commerce. My interest in the science mobilization bill stems from my conviction that this legislation is desperately needed and should be of great help to such a community as the one I represent. Ours is a town of approximately 15,000, perhaps the 10th city in Virginia, typical of Virginia, of the South, and indeed of many hundreds of small cities throughout every one of the 48 States of the Union.

Digitized by Google

As secretary of the chamber of commerce, one of my responsibilities is to see that commerce and industry in my community maintain and increase their profitability and usefulness to the community. In modern days of stiff competition success depends upon new products and new processes—new products to hold old and gain new markets, new processes to keep down costs. In Staunton and Augusta County, one of the wealthiest counties in the State, businesses are small. They do not, for the most part, have funds or facilities for research either into new products or new processes, as do large corporations. I support this bill because I believe it will make available to small companies research facilities and give them access to new inventions and processes to which they are now denied.

Another of my responsibilities is to maintain the economic health of the entire area by stimulating the growth and immigration of new industries so that the natural resources that now lie dormant or only half developed may be united with the labor resources still available in the community to bring additional prosperity to it. New industries today depend greatly upon new products. This bill would make available for commercial exploitation new products, and where necessary could carry them through the pioneering or pilot stage, so that the inordinate risks attendant upon new developments may in part be absorbed in such a way that excessive burdens are not placed upon small enterprises. The bill would make it possible for small businesses and small aggregations of local capital to enter into new activities with encouragement from the scientific arm of the Government, instead of meeting the tremendous obstacles they now encounter.

You may wonder how I became interested in these problems and in this bill. Let me refer you to purpose (1) of the bill "to appraise the current use of scientific and technical knowledge, facilities, and personnel, and to develop comprehensive national programs for the maximum use of science and technology in the national interest in periods of peace and war."

Such an appraisal is sorely needed. I am surprised that it has not already been made. No Federal or regional representative or agency of a technological kind has ever to my knowledge come to Augusta County to find out what we could do for the war effort, for defense industries, for the mobilization of our scientific or technical facilities or personnel.

I suppose, Senator, there have been at least 50 Government men representing one or another Government bureaus who have come down there to take our waste paper, rags, rubber, and scrap metal and, in several instances to ask how much factory space we had. Frequently we were not even asked what we made in the factories or what various and sundry services were contained there.

We in Staunton and Augusta County, however, were not so negligent. We felt that we could be of use. So we organized our own inventory of facilities that might be used in what in those days we call the "defense program." We, along with the adjoining counties of Rockingham and Shenandoah, organized back in 1940 the first small business facilities pool, I believe, in the entire country, the "Shenandoah Pool." We listed the small business manufacturing and technical facilities in the Shenandoah Valley around Staunton. Instead of

Digitized by Google

Washington coming to us we had to go to Washington. Some of our findings were put to use. Mostly they were not, but that is not the point. The point is that every community has something to offer which could be inventoried and then utilized as needed. That is why, I say, that a bill that proposed to survey scientific and technical facilities throughout the country is sorely needed.

Purpose (2) of the bill is "to mobilize for the prosecution of the war all scientific and technical facilities and personnel." Just as no attempt was made by the Government to inventory our facilities so no attempt was made to mobilize them. I think such mobilization is needed and needed now. Out of six of our major factories in Augusta County only two have been able directly to shift over to war or semiwar work. Yet the others would be glad and are indeed anxious to do so if the way how could be made clear to them.

I could go on with other purposes of the bill. But my eye is particular struck by purpose (8):

"to promote interest in scientific and technical education, and to provide for all qualified persons the means of scientific and technical training and employment."

Of the 16 boys in my high-school graduating class I am the only one who now lives in Staunton. Singularly for any graduating class, all these boys have made good. Some are prominent in business and the professions; but they have all had to carry on elsewhere than in Staunton. Several showed promise in science. None are now scientists. Why? Probably because of the lack of opportunity for scientific training in our small city and because there were no new industries opening up to stimulate the inventive genius and enterprise of these young men.

I might state that I had to do that and for 14 years was away from Staunton before I could get a job back there, myself. I just mentioned 16 boys in my class, and I think there were 23 girls, but I have not kept track of them. There might have been a Madam Curie in that crowd, and the lack of opportunity may have denied our country of such much needed services.

It is my hope and expectation that when this bill becomes law help will be given to the schools in towns such as Staunton to provide additional training in science; and in their business opportunities to provide scope for the enterprise and zeal of able young persons.

Let me give your committee a few examples of how this bill could or should be of help in my community—and when I say my community I suspect that what I say goes for a great many communities, hundreds, perhaps thousands, of them, each with their own local conditions, all over the country. Ours is an apple country. What we need is someone to do for the apple what Carver did for the peanut. Surely, more can be made from apples than apple sauce, apple butter, cider, and applejack. Millions of apples rot under our trees each year, apples that an inventive genius could surely introduce in some form or product into the stream of profitable commerce.

Each town and city has its inventors regarded half as geniuses and half as cranks by neighbors and townspeople. But upon their unsupported shoulders has been erected the industrial greatness of America. I think it is time we gave them some help. One of my neighbors is a

Digitized by Google

man who has long been trying to develop an up-to-date method for grading and packaging apples. And apple packaging, I am sorry to say, lags behind the packaging of many other products. This man has spent hundreds of dollars, probably more than he could well afford, to advance his belief that some solution to this problem must and can be had. Such a discovery could do a great deal for the entire apple industry of the Shenandoah. Yet his work is at a standstill. It is my hope that an organization such as the Office of Scientific and Technical Mobilization would not consider this problem too lowly, but would help lone inventors everywhere to bring their ideas to fruition.

I need hardly tell you, Mr. Chairman, that our chamber is opposed to waste of public funds and to the growth of sprawling bureaucracies. But we believe that this is not just another agency or bureau. Rather, we see in this office the elimination of 18 or 20 through the coordination of their work in 1 central office. It is just such streamlining that has long been needed in Government agencies. I would not, however, wish to see this streamlining confined to the national level alone. It is our hope that centralized planning and coordination may be accomplished with decentralization of operation to the maximum extent. I want to see a place nearby where the local inventor, local businessman, local scientist, and local engineer can go for help and advice. I want to see government going out to the people to stimulate and find the local inventor and small businessman and engineer and scientist and bring him into the war effort at the highest level of his ability. I think the organization set forth in your bill can achieve this. And this certainly should be its early and continuing aim.

Thurman Arnold, I understand, has described this bill as the Magna Carta of science. I think it is also a Magna Carta for the small city and the small town and small business. And I am gratified to be able to offer the committee studying these measures the wholehearted and enthusiastic support of a large and representative cross-section of the agricultural, commercial, and industrial interests of Staunton, Va. I also fully believe that I do voice the sentiments of the vast majority of chambers of commerce secretaries in the smaller communities throughout the country.

Staunton, may I remind you, is the birthplace of Woodrow Wilson, whose political genius and statesmanship flourished in support for the new freedom, a freedom which I believe your bill, Mr. Chairman, will bring to the businessmen, inventors, and technical men of the typical small American community.

Senator KILGORE. I know your community fairly well and I know its surroundings.

You speak of decentralization of operation, and centralization of planning. That is the keynote of the whole bill. The idea is to utilize every possible existing facility. For instance, take your own city—how far are you from Lexington?

Mr. TYNES. Thirty-eight miles.

Senator KILGORE. And Lexington has publicly owned laboratory facilities in connection with the two colleges?

Mr. TYNES. Yes, sir.

Senator KILGORE. We have found here that the college laboratory facilities have not been encouraged to get into the picture, have had little to work with, and have had no problems presented to them.

Mr. TYNES. Which I think is a mistake.

Digitized by Google

Senator KILGORE. Yes; they can be of tremendous assistance. Those laboratories already in existence in the Shenandoah, if they were properly coordinated, could render valuable assistance and encouragement. If they were given some problems they would solve them.

Mr. TYNES. Senator, they would love it. I have talked to a lot of them.

Senator KILGORE. Another thing, don't you find that your skilled mechanics and workmen do not like to leave their homes in Staunton and go to congested areas, but do better work when they can live at home under comfortable conditions and where, the fact is, they can live better on less dollar expenditure which makes for a lower cost product in the plants even though it requires a little more planning?

I recently saw a great row of machinery which took in an aluminum casting at one end, and worked it on down through the line and it came out at the other end of the line as a completely bored cylinder, shaped, fitted, drilled, and even threaded and polished. It was a wonderful thing to me but it was simply a connection of various machines hooked into a line, and they were fed together.

You could take those machines separately and turn out the same cylinder. The plant with the necessary equipment could bore and produce an airplane cylinder just as easily in Staunton as could be done by hooking those machines together in this big plant. The work could be done under proper conditions without the tremendous cost of defense migration resting on us—millions are being spent on housing in the congested areas.

We would then be in shape at the conclusion of the war to convert back to a peace time economy with less lost motion, less displacement, and less cost to the Government.

Mr. TYNES. Senator, all I can do is add a great big exclamation point to what you have just said.

Senator KILGORE. I am glad to get your comments, because I am a small-town man myself. I live in a community about the same size as Staunton, and probably know more of the problems of towns under 25,000 than I do of those of the bigger cities. The majority of the population in the United States in normal times live either in the country or towns of that size. Every one of the plants in those towns grew up because there was a definite need for that plant, isn't that correct?

Mr. TYNES. That is true.

Senator KILGORE. With improved techniques, those small plants can compete and your community can still continue to exist and, in fact, grow and flourish. But without improved techniques, they cannot compete. The problem of patent pools and the grabbing of new developments is, I believe, hinged largely on the present lack of scientific planning—not centralization, but lack of it.

Mr. TYNES. I think so, sir.

Senator KILGORE. Do you have any questions, Mr. Collins?

Mr. COLLINS. Have any of your small industries had trouble converting to war conditions?

Mr. TYNES. I would not say that they have had trouble, they just have not converted.

Mr. COLLINS. Could you give us an example of where this bill might help them?

Digitized by Google

Mr. TYNES. Yes, sir. I think if someone, for instance, having made this survey of technical facilities and personnel, were to come down and say "What needs to be made down here is thus and so," some gadget for use in the war effort, there are plants there, machine shops, furniture factories, hosiery mills, that have lathes and other machinery which I know could turn out something for the war; but no one has shown them the way and they do not have money enough to pioneer in that field.

Mr. COLLINS. Do you have a rayon factory?

Mr. TYNES. We have a flourishing hosiery mill. We had a mill, in fact, three small mills, making very fine silk hosiery. When they could no longer obtain silk for those mills, they switched to nylon and manufactured nylon hosiery for a while. When nylon was no longer obtainable, they switched to rayon. Now that rayon has gone out, they have switched to lisle. In each instance—because the mills were not in the big swim—while there was not an actual shut-down of the plant, there was a material slowing down during the conversion period. They did not have access to——

Senator KILGORE. To advance information?

Mr. TYNES. Yes, sir. They had no access to any advance information so far as I know.

Senator KILGORE. And they had to go out and hunt it up for themselves?

Mr. TYNES. Yes, sir.

Senator KILGORE. And frequently hunt it up from their competitors; isn't that right?

Mr. TYNES. Yes, sir; that is correct.

Mr. COLLINS. I understand that you have traveled extensively visiting other towns. What have you found regarding the prevalence of research facilities of small businesses?

Mr. TYNES. Before I moved back to Staunton some 7 years ago, I suppose I must have visited eight or nine hundred factories of one kind or another. I have never seen a research laboratory set up in a factory that employed less than 500 people. I started to say 1,000, but I suppose that is an exaggeration.

Now, I have noticed all the larger factories have them, and they must have them for a purpose. Surely they must derive a benefit from them or they would not have them. But the smaller factories simply cannot afford them.

Senator KILGORE. Have you checked the letting of war contracts in the United States as contrasted with that in England?

Mr. TYNES. No, sir; I have not.

Senator KILGORE. The most recent figures show that here 80 percent of the war contracts have been let to 100 corporations, whereas in England 80 percent of the contracts are let to factories employing 200 or less employees.

There is another interesting fact which is in the testimony before this committee and that is that after the last World War, England, realizing the shortage of research, subsidized laboratories in small plants.

Of course, we have such a vast spread of territory that perhaps we could not do that. But it seems to me that it is significant that technical facilities were made available to the small plants in England

Digitized by Google

after the last war, and that those plants are carrying 80 percent of the load of the war work today in England.

There is another interesting aspect of that. Lord Beaverbrook made a statement in this country that England is utilizing machinery and equipment which we would not even think of using, that if they did not have a combination machine to make a shell, then they ran it through, say, four processes, and tried to run it fast enough through the four processes to make the shell as fast as we made one in one operation on one machine.

Mr. TYNES. Senator, I think it is a sad commentary on us that we have not taken a leaf from England's book there. Here we have built up, at tremendous expense and great loss of time, a great number of large factories up and down the land, which are literally yawning for raw materials, and which, as you explained a moment ago, created great movements of labor and numerous housing problems. If those in authority here had at least tried the "bits and pieces" method of manufacture, and then set up assembly plants in strategic spots, I think it would have been a great help. Such a procedure would have been difficult, and perhaps slow in getting under way, but in the long run it would have saved time, millions of dollars, a tremendous quantity of critical materials, and countless man-hours which had to be utilized in building and expanding factories when existing factories could have been put to better use.

Senator KILGORE. It is a peculiar thing that we are the only country engaged in the war which is not using that system but are still "big business" in our production methods. Our idea is still that good material can be produced only in a big plant.

Mr. COLLINS. Do you feel this bill could be of any help in developing mineral resources in your State?

Mr. TYNES. I feel that it would be. I cannot say that I know it would, because I am not a geologist; but I have a feling that there is just as much wealth under the soil there in Staunton and Augusta County as we grow on top of it. Specifically we know that we have some bauxite—a little of it is already being mined in a sporadic fashion by outside concerns—and I know we have some manganese.

Senator KILGORE. Don't you also have some iron?

Mr. TYNES. We may have a lot of it; I know we have some.

Senator KILGORE. It wasn't so very far from you that a large part of the iron was gotten for furnaces in Richmond in the Civil War, was it?

Mr. TYNES. No, sir.

Mr. COLLINS. Is your manganese being developed at all now?

Mr. TYNES. Not a great deal. There are two manganese mines in the southern section of the county, and I hear that a very fair grade of ore is coming from them.

Farmers come to me frequently to see whether they can get someone to come down from Washington to look at their property. They have been picking up black rocks which they have turned up with their plows, and they think that they perhaps have minerals which could be mined to advantage.

Senator KILGORE. The trouble with the iron ore, I think you will find, is that it is not as high a grade as the Mesabi Range iron. Because of the methods of manufacture now used in the United States and the fact that we refused to go into sponge iron, the ore is lying

Digitized by Google

dormant, just as is the iron ore in my own State, which is there in quantities.

Mr. TYNES. We are going to run out of scrap some day and have to use sponge and like it.

Senator KILGORE. Scrap has so far obviated the necessity of using sponge iron, but when we run out of scrap we will use sponge. We will probably get completely out of scrap before we will turn to sponge.

Mr. COLLINS. Are current developments financed by local capital or out of State capital?

Mr. TYNES. They are financed largely by out-of-State capital. It is not because we do not have the capital there. We have some men of considerable wealth in the county, but they are hesitant to take any risks when they know from the outset that they do not have access to all of the industrial research that is at the command of the big concerns.

Senator KILGORE. Yes; and outside capital is able to get licenses and various other things in a way that your local capital cannot; is that not correct?

Mr. TYNES. Yes, sir.

Mr. COLLINS. In your opinion, would this bill help with the development and use of local capital resources?

Mr. TYNES. I think very likely it would. If a group of men wanted to form a company to manufacture a given product and felt that there was some over-all agency, such as the Office provided for in this bill, to give them guidance, right from the start, I do not believe they would be so hesitant in risking their money as they are now.

Senator KILGORE. And also, if they felt they would be kept abreast of the most modern and latest shop practice, with the ability to obtain licenses on an equality with the larger companies; and the privilege of manufacturing and using modern methods without being faced with the possibility of a license revocation whereby they might be forced out of business, they would feel better about it investing their capital; is that not correct?

Mr. TYNES. Undoubtedly so, sir.

Mr. COLLINS. Are there any other features of the bill, Mr. Tynes, that appeal to you?

Mr. TYNES. Yes, sir. I like the over all cooperative idea, that this office would provide. It would be run something like a chamber of commerce is run. The chamber of commerce pools all of the best brains of a community and in effect sets itself up as a community workshop. I think the proposed Office of Scientific and Technical Mobilization has inherent in it the possibility of becoming a magnificent workshop around which would rally the best scientific and technical talent of the country.

I think, too, that we have not done enough to encourage scientific research development from a government standpoint.

If you will go to those countries which have encouraged and subsidized music, you will find that they have turned out good composers and musicians. I think that if this country did a little more to encourage—and in some instances, perhaps, subsidize—scientific research, we would get along faster and better.

Senator KILGORE. Mr. Tynes, we appreciate your coming here very much. We have been happy to have your statement.

Digitized by Google

I hope you will not object if we send copies of your testimony to other secretaries of chambers of commerce for their comments, sir.

Mr. TYNES. I believe that the majority of them will agree with what I have said, and what you have said, sir, and I certainly have no objection.

Senator KILGORE. That is, unless you get into a town in which the chamber of commerce is largely controlled by outside influence.

Mr. TYNES. Of course, there are some such chambers of commerce.

Senator KILGORE. The committee will now adjourn, subject to call of the Chair.

(Whereupon, at 1:30 p. m., the committee adjourned, subject to call of the Chair.)

SCIENTIFIC AND TECHNICAL MOBILIZATION

TUESDAY, APRIL 27, 1943

UNITED STATES SENATE,
SUBCOMMITTEE ON SCIENTIFIC AND TECHNICAL MOBILIZATION
OF THE COMMITTEE ON MILITARY AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to notice, at 10 a. m., in room 135, Senate Office Building, Senator Elbert D. Thomas (acting chairman) presiding.

Present: Senators Thomas (acting chairman) and Murray.

Also present: Henry H. Collins, Jr., of the committee staff.

Senator THOMAS. The subcommittee will come to order.

Mr. Lindquist, will you state your name, your address, and your position; and then proceed as you wish, please?

STATEMENT OF JOHN A. LINDQUIST, CHAIRMAN (ACCOMPANIED BY FRANK WILBUR MAIN; LELAND G. SUTHERLAND; AND JOHN L. CAREY, SECRETARY), COMMITTEE ON ACCOUNTING MANPOWER OF THE AMERICAN INSTITUTE OF ACCOUNTANTS

Mr. LINDQUIST. My name is John A. Lindquist; I am from New York; and am chairman of the Committee on Accounting Manpower of the American Institute of Accountants. I am a partner in the firm of Ernst & Ernst in New York City. I have a statement which I should like to present on behalf of the institute and its committee.

Senator THOMAS. Very well.

Mr. LINDQUIST (reading):

The American Institute of Accountants' Committee on Accounting Manpower favors the provisions of section 3 (e) and section 5 (a) of Senate bill 702, in the belief that the most effective use of technical accounting personnel in the prosecution of the war requires the establishment of a central agency with authority to make conclusive recommendations for deferment of trained and experienced accountants from military service.

Our support of these provisions of Senate bill 702 is not based upon any desire that all trained and experienced accountants should be deferred from military service in the future, but only upon the conviction that a minimum number of essential accountants must be left in professional practice if the economic machinery which supports the war effort is not to be seriously impaired. The retention of this required minimum cannot be assured under the decentralized administration of selective service by local boards.

We are concerned exclusively with provisions of section 3 (e) and section 5 (a) of Senate bill 702, which relate to the mobilization of

Digitized by Google

scientific and technical manupower for the prosecution of the war. Our committee is not authorized to express any opinion with respect to any of the other features of the bill.

IDENTIFICATION OF WITNESSES

The American Institute of Accountants is the national organization of certified public accountants, founded in 1887. Its membership includes nearly 7,000 of the approximately 24,000 certified public accountants in the United States. A great majority of its members are in professional public accounting practice, although more than a thousand are officers of industrial corporations and Government agencies, and teachers of accounting.

The institute's headquarters are at 13 East Forty-first Street, New York. Its committee on accounting manpower, which submits this statement, was appointed for the purpose of cooperating with the War Manpower Commission and the national headquarters of the Selective Service System in an effort to facilitate the use of trained and experienced accountants in a manner which will best meet the needs of the armed services, the civilian war agencies of the Government, war industry, and other business essential to the support of the war effort.

UTILIZATION OF TRAINED AND EXPERIENCED ACCOUNTANTS IN THE WAR EFFORT

By the armed services: The younger unmarried accountants have gone to war. While there are undoubtedly some exceptions, we believe it may be fairly stated as a generalization that no able-bodied single men under 38 remain in public practice. Thousands of these younger men are serving in combat branches of the Army and Navy. Some casualties among them have already been reported. In addition to these men, however, the Army and Navy have taken a considerable number of accountants from the professional ranks, and are using them in the audit of war contractors' costs under cost-plus-fixed-fee contracts, the audit claims of contractors under terminated fixed-price contracts, analysis of costs in renegotiation proceedings, and in similar matters. Many of these accountants are serving as commissioned officers; others are employed as civilians.

By war industry and other business essential to support of the war effort: Essential industry requires the assistance of professional public accountants in the determination of allocation of elements of costs, in devising and installing procedures for accounting control of pay rolls and materials, in the audit of financial statements required as a basis of credit, in the calculation of reporting of taxes, and in the preparation of numerous reports required by various agencies of the Government. Professional public accounting firms rendering such services to essential enterprises are unable to procure a sufficient number of trained and experienced accountants to meet the present requirements.

A more detailed outline of the nature of the practice of public accounting is appended to this statement as an exhibit.

QUALIFICATIONS OF PROFESSIONAL PUBLIC ACCOUNTANTS

The certified public accountant certificate is the recognized legal evidence of qualification in the profession of public accounting. This

Digitized by Google

certificate is granted under authority of State laws, which, while varying somewhat in detail, practically all require a minimum amount of education and a written examination as a prerequisite to granting the certified public accountant certificate. The examination given in 45 States and Territories is a standard two-and-one-half-day examination, prepared by the board of examiners of the American Institute of Accountants, and adopted by the State boards concerned. Most of the leading universities have established courses in accounting, and a large proportion of the man who have entered the profession of accounting in recent years have been graduates of these universities. Generally speaking, at least 3 years' practical experience in public accounting is regarded as necessary preliminary training before an individual may be entrusted with responsible accounting work without close supervision.

AVAILABLE NUMBERS OF TRAINED AND EXPERIENCED PROFESSIONAL PUBLIC ACCOUNTANTS

There were before the war only about 22,000 certified public accountants in the United States, of whom a substantial number were not engaged in professional public accounting practice. Those who were engaged in professional practice before the war employed or were associated with a substantial number of accountants who had not yet obtained their certified public accountant certificates by the required State examinations. The exact number of these noncertified practitioners is not know, but, at any rate, it is clear that the entire body of professional accountants is not a significant number in terms of the Army's manpower requirements. In terms of efficient operation of the Nation's economic, industrial, and business machinery, however, this professional group has been recognized as of great importance.

Evidence of a shortage of trained and experienced accountants was presented to national headquarters of the Selective Service System by the American Institute of Accountants in March 1942. This evidence consisted of the opinions of some 275 accountants and teachers in all parts of the country. The National Roster of Scientific and Specialized Personnel is at this time considering the possibility of conducting a survey of the accounting profession to obtain statistical evidence of the extent of the shortage of trained and experienced accountants at this time. Great difficulty is now being encountered by the armed services and other Government war agencies in obtaining the services of a sufficient number of trained and experienced accountants to carry on their work.

THE STATUS OF PROFESSIONAL ACCOUNTANTS UNDER SELECTIVE SERVICE

Accounting services supplied to the war production program and to activities essential to support of the war effort are included in the group of technical, scientific, and management services listed among the 35 activities proclaimed essential by the War Manpower Commission. Certified public accountant is included among a list of essential occupations set forth in Activity and Occupation Bulletin No. 35, issued by national headquarters of the Selective Service System, March 1.

The National Roster of Scientific and Specialized Personnel has under consideration a request of the American Institute of Accountants

Digitized by Google

that a national committee be established by the War Manpower Commission, as authorized in Activity and Occupation Bulletin No. 35, to assist the Selective Service System by reviewing affidavits for occupational classification.

THE NEED FOR A COMPETENT CENTRAL AGENCY TO AUTHORIZE OCCUPATIONAL DEFERMENTS

The experience of the accounting profession under the Selective Service Act up to this time, which we presume must be similar to the experience of other professional and technical groups, has demonstrated the need for some central authoritative agency equipped to evaluate accurately the qualifications of an individual professional man or technician and to determine whether his contribution to the war effort in his present job is sufficient to warrant occupational deferment.

This committee has no general criticism of selective service local boards which, in general, have done a good job under the most difficult circumstances. Selective service local boards, with the guidance of directives and advisory bulletins from selective-service headquarters, are generally competent to evaluate the qualifications of workers in industry, agriculture, and commerce in terms of relationship to the war effort, but it is unreasonable to expect that those who serve on local boards should be in possession of the necessary information and experience to evaluate with equal success the qualifications of technically trained persons in highly specialized fields.

The profession recognized from the first that it would be necessary to relinquish a large proportion of its manpower as every other occupational group was required to do. The older practitioners accepted the inevitable necessity of carrying an increased burden to make up for the loss of the younger men. Firms have recognized the necessity of discontinuing some work normally undertaken which was not essential to the support of the war effort.

The point has now been reached, however, where the continuation of professional public accounting practice, even on a greatly reduced scale, is in real danger. If the situation continues for another year as it is now, there seems good reason to fear that no able-bodied men, under 38, without children, will remain in practice; and possibly later, married men with children and men in the age group between 38 and 45 will be withdrawn.

In considering a request for occupational classification of an individual certified public accountant or a trained and experienced professional staff accountant in the employ of a certified public accountant, the selective service local board is called upon to determine whether or not the clients being served by such individual are in activities essential to support of the war effort, whether or not the services rendered such clients are of a nature which contribute to the war effort, and whether or not the individual registrant can be replaced within a reasonable length of time. The last question involves the determination of whether or not a shortage exists locally. In this connection a peculiar difficulty is injected through the rather loose and widespread application of the term "accountant" to bookkeepers and clerks, many of whom possess civil-service ratings, who work on accounting records but are not qualified professional accountants.

Digitized by Google

Instances have been reported, for example, in which draft boards have inquired of the United States Employment Service as to whether or not there was a shortage of accountants, and the response has been in the negative because many bookkeepers and clerks describing themselves as accountants were registered with the United States Employment Service and, as a consequence, the request for occupational classification of a trained and experienced professional accountant has been denied, even though he seemed wholly eligible for occupational classification under the provisions of the selective-service occupational bulletins.

Local draft boards cannot be criticized for failure to make accurate analyses of such complex situations in view of the tremendous scope of the work of these boards, but it seems reasonable to assume that a central agency, concerned entirely with specialized and technical personnel, would be able to cope with such problems effectively. The examination of accounts and records and the certification of financial statements, for example, might seem to a draft board remote from activity necessary to war production, or to support of the war effort, yet in a given instance such work might be essential to the adequate financing of a war producer since both Government lending agencies and private credit grantors require reliable statements of financial position, and results of operations of enterprises which are applying for capital loans.

CONCLUSION

It is, therefore, our belief that it would be in the best interest of the Nation to enact into legislation the provisions of section 3 (e) and of section 5 (a) of Senate bill 702, which would transfer to an Office of Scientific and Technical Mobilization the powers, personnel, and facilities of the National Roster of Scientific and Specialized Personnel, and would authorize the administrator to determine whether occupational deferment should be granted to persons in scientific or technical occupations, certified with the approval of the chairman of the War Manpower Commission, as critical in the war effort, such determination to be conclusive upon selective service local boards.

Respectfully submitted.

(Signed) AMERICAN INSTITUTE OF ACCOUNTANTS,
COMMITTEE ON ACCOUNTING MANPOWER,
JOHN A. LINDQUIST, *Chairman*,
FRANK WILBUR MAIN,
LELAND G. SUTHERLAND,
JOHN L. CAREY, *Secretary*.

To this statement is attached an exhibit, which is a brief and comprehensive definition of the practice of public accounting.

(The material submitted was marked "Exhibit No. 12" and follows:)

EXHIBIT NO. 12

THE PRACTICE OF PUBLIC ACCOUNTING

For many years the practice of public accounting consisted largely of annual examinations of financial statements for credit, financing, stockholders, etc. A greater part of this work came in the first 3 months of the calendar year.

Digitized by Google

In recent years such services have become relatively less important in comparison with other services to such an extent that public accountants are now serving their clients throughout the year in various special matters involving a wide variety of management's problems. At the present time, the most valuable part of the services of a well qualified public accountant and yet the most difficult to appraise and define is his advice and counsel to business management.

The huge expansion of war production, the introduction of new products and methods, industry's loss of accounting personnel and the shortage of replacements for them, and many other factors, have greatly increased the demand upon skilled public accountants to meet these new problems.

Among the activities of skilled accountants required by these special matters are:

PRODUCTION

(1) *Advising management in organization and personnel matters.*—The precipitous growth of industry for war production has far surpassed the ability of management to handle the problems related to such expansion. Therefore, management seeks the expert assistance available in the field of public accounting.

(2) *Cost determinations.*—All contracts are based upon costs. Skilled counsel is required in devising methods for determining and allocating the elements of cost, first, in the preparation of estimates before prices are determined and, second, to ascertain actual costs of production.

(3) *Production planning and control.*—Devising procedures for planning production schedules, issuing manufacturing orders, recording production and accounting for same, thus facilitating the flow of production and preventing bottlenecks and other interruptions.

(4) *Wage incentive plans.*—Devising and installing plans for payment for labor operations, including incentive bonuses for increasing production, also devising means for adequately accounting for pay-roll expenditures, establishing standards for such costs and instituting methods for checking and control of same. The effect of these procedures is to increase the effort of the individual workman, providing an adequate reward or incentive for such increased effort and to minimize disputes and misunderstandings regarding matters of compensation.

(5) *Material Control.*—Devising and installing procedures for procurement of materials, receiving, storing, and issuing of such items to manufacturing operations, both as to physical arrangements and record-keeping to the end that materials will be available when needed and yet not permit undue accumulation of inventories that may be needed elsewhere; also to prevent excessive investment in such items.

(6) *Cost records.*—Establishing suitable means for recording actual production costs, reporting and checking such costs against previous estimates, thus providing the means for preventing excessive costs and unnecessary delays in production.

(7) *Renegotiation of contracts.*—In order to deal intelligently with renegotiation of war contracts, adequate records of costs must be available. Procedures must be installed for that purpose, then information submitted for the use of governmental agencies and the contractor to determine actual costs and profit margins. The public accountant, because of wide experience in many types of manufacturing enterprises, contributes essential services to the Government and the contractors in connection with all such matters.

FINANCIAL

(1) *Financial planning.*—In most cases involving plant expansion, increased inventories, etc., it is necessary to prepare forecasts for the purpose of making the necessary financial plans, the preparation of such forecasts requiring the utmost skill and experience.

(2) *Credit arrangements to finance plant expansions and working capital.*—(*a*) Preparation of certified financial statements, cost schedules, and other data required by banks and governmental financing agencies.

(*b*) Forecasting cash requirements to show time and amount of financial assistance required.

(*c*) Forecasting operating results to support applications for loans.

(*d*) Participation in conferences to assist both parties in completing arrangements.

Digitized by Google

TAXATION

(1) *Preparing applications for necessity certificates relating to emergency plant facilities.*—Formal application required in order that new plant facilities may be amortized over period of emergency.

(2) *Preparation of income, excess profits, and other tax returns.*—(*a*) Corporation returns are intricate and accuracy is imperative because of high rates.

(*b*) Most companies call on certified public accountants for assistance in preparation of tax returns.

GENERAL

(1) *Periodic verification of corporate financial statements required by corporate procedure, governmental agencies, and others.*—Such statements include requirements of Securities and Exchange Commission for certified financial schedules, certified financial statements required by banks and other financial agencies, certified financial statements for submission to corporate directors and stockholders.

Senator THOMAS. There are one or two questions which I would like to have answered for the record.

In view of the common meaning of the term "technical personnel," why would you say that accountants should be included under that classification?

Mr. LINDQUIST. Because a considerable period of technical training is necessary to qualify a man for the practice of public accounting. In addition to that he must take a comprehensive examination in technical subjects given by states as a condition to recognition as a certified public accountant.

Senator THOMAS. Have those examinations become pretty uniform throughout the country?

Mr. LINDQUIST. They are uniform throughout 45 States and Territories and are prepared by the American Institute of Accountants.

Senator THOMAS. To what extent are accountants working in Government agencies, and what usually constitutes their responsibilities?

Mr. LINDQUIST. That is a very broad question, Senator, which I cannot answer categorically. They serve in capacities ranging from that of audit clerk to the very technical and responsible positions of, say, chief auditor on war contract projects.

Senator THOMAS. They use them also in the F. B. I.?

Mr. LINDQUIST. There are accountants in the F. B. I, yes.

Senator THOMAS. And in the Treasury Department?

Mr. LINDQUIST. In the Treasury Department.

Senator THOMAS. And on tax matters?

Mr. LINDQUIST. Yes.

Senator THOMAS. And accountants are generally serving all the courts, are they not, in bankruptcy cases?

Mr. LINDQUIST. Yes; they serve in bankruptcy cases.

Mr. COLLINS. Of the 24,000 C. P. A.'s which you mentioned, how many of those are in Federal employ?

Mr. LINDQUIST. That I do not know, Mr. Collins.

Mr. COLLINS. Do you know, Mr. Carey?

Mr. CAREY. We haven't any exact statistics, but we think there must be several thousand now serving the War Department and the Navy Department, the R. F. C., the F. B. I., and Treasury, which were mentioned, and other Government agencies. There has been an influx in the last 2 years.

Digitized by Google

Senator THOMAS. Generally speaking, when a man becomes established as a public accountant he is so much better off economically in private practice than he is in Government that he stays there, does he not?

Mr. MAIN. I think that is true, except in wartime.

Many have now gone into Government service at an economic sacrifice.

Senator THOMAS. The standards of the Civil Service Commission are not quite as high as the State standards—a man can get qualified as first-class accountant on examination under the civil service without being a C. P. A., can he not?

Mr. LINDQUIST. That is true.

Senator THOMAS. Still, considering the Civil Service examination and the qualifications that a man has to have to be considered for a job, I suppose the standards of the Civil Service are perhaps just as high in the long run?

Mr. LINDQUIST. That, again, is a question that I cannot answer categorically.

Do you know, Mr. Main?

Senator THOMAS. It is a question of opinion, naturally. You can never prove that Bill Jones without any qualifications on paper sometimes is a better man than another fellow with them.

Mr. MAIN. One of the facts that must be kept in mind is that before a man can become a certified public accountant, in practically all of the States, it is necessary not only to pass an examination, but also to meet certain educational requirements, and on top of that to have a certain number of years of experience in accounting, a number of which years must be in public accountancy.

Senator THOMAS. Doesn't he always have to have certain sponsors, too, before his certificate is issued to him?

Mr. MAIN. Yes; he must have certain sponsors, but I would say that there would be no more difficulty there than there would be in Civil Service.

Senator THOMAS. That is true.

Mr. LINDQUIST. I might add that for a certified public accountant's certificate in at least two States, I believe, a college degree from a recognized college or university with a major in accounting is a prerequisite.

Senator THOMAS. It is a baccalaureate degree?

Mr. LINDQUIST. That is right.

Mr. MAIN. That is in only two of the States. The others require a high-school education.

Mr. COLLINS. Of the 24,000 C. P. A's in the United States, how many of them do you estimate have been inducted in the armed services?

Mr. LINDQUIST. Have you anything on that, Mr. Carey?

Mr. CAREY. I could not make any statement on that without giving a very wild guess, Mr. Collins. The National Roster, as Mr. Lindquist's statement indicates, is now considering making a detailed survey to get the answer to that and other questions.

We know there has been a very high percentage of loss, in some firms 30 or 40 percent, but how it would run throughout the country I can't answer.

Digitized by Google

Mr. COLLINS. You don't have any information on how many are in the armed services, whether by induction or by volunteering?

Mr. CAREY. No. We know it runs into the thousands.

Senator THOMAS. Your statement contains a general description of the place of accountants in the war program. Could you be more specific and illustrate just how they are used?

Mr. LINDQUIST. They have been used by Government agencies in connection with the certification of costs on war project contracts; in the certification of the final construction costs on emergency plant facilities contracts, on the basis of which compensation is paid.

They are used in establishing and certifying costs under certain contracts between contractors and the war agencies of the Government, as, for example, production and distribution costs of certain products.

They have also been used in certifying the costs of subcontractors on supply contracts.

They have been used and are being used in certifying the excess cost of bringing fuel oil and gasoline to the eastern seaboard. For example, by way of railroad tank car rather than the customary method of tanker through the Gulf and around Florida and up the Eastern Seacoast.

Those are some. Perhaps the other gentlemen may be able to add to those.

Senator THOMAS. What difficulty is there being encountered in industry and in the Government due to shortages of accountants?

Mr. LINDQUIST. It is becoming difficult to render promptly the services that war contractors need in connection with the establishment of adequate cost systems where they don't already have them, and costs are essential under contracts with the Government. That is an illustration of one way in which the public accounting profession cannot properly, and as adequately as it would like to, serve war contractors.

Mr. MAIN. I might add that a corporation engaged in war work is called upon to expand and enlarge, sometimes to increase their facilities by as much as 10 times, and with their own forces depleted they are constantly calling upon public accountants to render more and more services and to take care of the additional work which must be done in handling Government contracts. It is quite a different thing to handle a Government contract than it is to handle a contract with a private concern because the Government contract is subject to audit, subject to renegotiation, and subject to review, such as is not customary in ordinary business.

Senator THOMAS. Are there any other questions?

Mr. CAREY. You asked about the difficulties that the Government agencies encounter. In our office we try to help those agencies in securing men when they need them—men with accounting training. It happens that the Navy on its cost inspection work and also in its renegotiation work, and the War Department in its contract auditing, and the Reconstruction Finance Corporation, have had a great deal of difficulty in securing enough trained accountants to do the work they have to do to protect the Government expenditures under these contracts. Their men are drafted just the same as the members of

Digitized by Google

the staff of the accounting firm. A shortage takes place in all areas simultaneously.

Senator MURRAY. Is there no policy now in the selective service with respect to deferring certified public accountants?

Mr. LINDQUIST. The selective service has issued what is known as Occupational and Activity Bulletin No. 35 which lists professional accounting service as an essential activity, and a certified public accountant as a man engaged in essential activity, but that does no more than entitle a man to consideration by a local draft board for occupational deferment. It does not provide occupational deferment in and of itself.

Senator MURRAY. And usually they are not deferred. I know a young man who is a graduate of the Harvard School of Business Administration, a certified accountant with a number of years' experience in New York City, who was drafted notwithstanding the fact that he was a very highly experienced accountant, and was married. He was taken and is in north Africa now.

Mr. MAIN. That case could be multiplied, Senator.

Mr. LINDQUIST. Deferment has been denied in many, many cases.

Senator MURRAY. It is the same mistake as was made in reference to deferring medical students and dental students and interns in hospitals, and so forth. We tried to get them to consider it at the very outset.

Senator THOMAS. Are there any other questions?

(No response.)

Senator THOMAS. Thank you very much for coming, gentlemen; we appreciate your being here.

Mr. MAIN. We appreciate the opportunity to be here, Senator.

Senator THOMAS. The subcommittee will now stand adjourned, subject to the call of the chairman.

(Whereupon, an adjournment was taken, subject to the call of the chairman.)

SCIENTIFIC AND TECHNICAL MOBILIZATION

THURSDAY, JUNE 17, 1943

UNITED STATES SENATE,
SUBCOMMITTEE ON WAR MOBILIZATION OF THE
COMMITTEE ON MILITARY AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to call, at 10:30 a. m., in room 104–B, Senate Office Building, Senator Edwin C. Johnson (acting chairman) presiding.

Present: Senator Johnson (acting chairman).

Also present: Henry H. Collins, Jr., and Herbert Schimmel, of the committee staff.

Senator JOHNSON. The committee will come to order.

The other members of the subcommittee are not able to be present today, but the record will be available for all of them.

Mr. Nau, will you give the reporter your name and position and then proceed with your statement.

STATEMENT OF CARLTON NAU, SECRETARY-MANAGER, AMERICAN PUBLIC POWER ASSOCIATION

Mr. NAU. My name is Carlton Nau, secretary-manager of the American Public Power Association.

I have here a prepared statement, which I would like to read and submit for the record, setting forth my interest in the proposed legislation and why I think it is beneficial to our people.

Senator JOHNSON. Proceed as you like.

Mr. NAU. My interest in the Science mobilization bill, S. 702, inheres in my position as secretary-manager of the American Public Power Association, a cooperative organization of publicly owned electric systems. Perhaps no group is in greater need of technological assistance and advice than the scattered municipal engineers and those other officers who have the handling of municipal and other publicly owned electric power projects all over the country.

The American Public Power Association is a nonprofit corporation, nonpolitical and nonpartisan, designed to provide management services to its members, and to act as a central clearing house for the exchange of information. We are on a war basis now, and our services are more needed than ever in a period of a shortage of power for war industries, labor shortages, hotel and travel restrictions.

The general purposes of the association are:

To promote cooperation and the exchange of information among members.

Digitized by Google

To promote mutual improvements and advance the common purpose of its members.

To supplement local services for members with particular regard to problems in the fields of (1) management, education, and personnel training; (2) engineering design, construction, operation, and research—I may pause a minute and add there that section (2) is the one in which we are particularly interested, particularly in its relationship to S. 702; I will elaborate on that further on in my statement—(3) accounting and commercial practices; (4) legal policy; and such other problems as may be common to, or of general interest to, public power systems.

There are about 3,000 municipal or State power projects, of which about 1,000 generate their own power and 2,000 buy power from private and other sources. Very few of these public power organizations have any research facilities. While they are in the same business as privately owned systems, their lack of national organization and restrictive limitations in their creation have resulted in an almost complete lack of facilities for research and scientific study of problems in the field. Furthermore, results of such studies on the part of private groups such as the Edison Electric Institute are not generally available to public power systems. The average publicly owned system serves a town of 10,000 or 12,000 people, and it is pretty evident that only larger systems can afford to engage in research.

It is very clear, then, why certain portions of S. 702 carry a special appeal to me as an officer of the American Public Power Association. Paragraphs (5) and (6) of section 1 would be a great benefit to publicly owned power projects—

(5) to promote the full and speedy introduction of the advanced and effective techniques—for the benefit of agriculture, manufacturing, distribution, transportation, communication, and other phases of productive activity; for economical and efficient Federal, State, and local government * * *;

(6) to aid, encourage, and protect the research and enterprise of inventors, scientists, technicians, scientific and educational institutions, research laboratories and Government establishments engaged in scientific and technical work, and to make their resultant discoveries more readily available, and without discrimination, to all sections of industry, agriculture, and the public, in order to aid the war effort at the present time and in order to promote full employment and higher standards of living after the war.

A great deal has been said in the testimony before this committee about its potential aid to small business. I have read with much interest what Mr. Finley Tynes, of the Staunton Chamber of Commerce has had to say. Like aid could be given to the small and large "businesses" represented by publicly owned power projects. Municipally owned power plants and systems, while not engaged in a strictly governmental function, are political subdivisions of State government. Other sections of city government have access to the results of study and research of State or National agencies, both public and private, in such fields as health, police, fire, gas, and water. For example, there is an American Water Works Association and the American Gas Association. But, strangely enough, public power systems up until recently had no national association and were consistently opposed by those interests dominating electrical engineering research in State universities and colleges. A careful review of the Federal Trade Commission reports of 1934 on utility corporations will reveal, in part at least, the extent to which State research agen-

Digitized by Google

cies and even individual college professors were influenced by the vast and sometimes subtle powers of the electric utility industry.

Squeezing out water from stock structures and elimination of the holding company evil are only part of the accomplishments when a municipality acquires its own system. There still remain unseen obstacles, such as the monopoly control over research, patents, and processes. Here, then, is where this proposed legislation can make available to the average consumer of electricity the benefits of free and independent research and the advantages of technological progress which, if the experience of the last war is any guide, will be greatly accelerated by the war and in the immediate post-war period. Experts admit we are only on the threshold of the "electric age." That age can be made to serve man to its fullest extent only if "free enterprise," in its original and true meaning, is made to work.

By way of further explanation of this point, let me continue: The American Institute of Electrical Engineers is a national organization made up for the most part of men employed by the large electrical companies. Problems are parceled out to committees to be worked out within the framework permitted by the large interests. There is a committee on meter construction, a committee on transformers, and so on. There is a full list of them in the Yearbook of the American Institute of Electrical Engineers. Too frequently research and design on electrical equipment is not based on economy of materials or performance, but on the protection of capital already invested and on the principle of protecting patents.

These committees appear to be dominated by two groups: the manufacturers and the large utility holding company groups. Within the committees, technological information is in the hands of the large manufacturers who do technological work for the utilities. The use of technology, in turn, is dominated by the utility groups, who see to it that any considerable advances are promptly chloroformed if they represent any threat to patent control or to the financial structure of the big utility groups.

The principle of the fluorescent lamp is not new. Yet it was kept off the market for years because it would cut power bills by something like 50 percent. The utility companies, who get a major portion of their net revenues from residential consumers, vigorously opposed the introduction of the lamp and, in effect, agreed with the manufacturers that the illuminating qualities would be stressed in advertising—even though the high lighting levels were not required—and no mention would be made of the saving on the power bill. This, along with an organized program to discourage its public acceptance, kept from the consumer a highly efficient and far more economical light. That the public took to this lamp is indicated by a statement from one company to the effect that the fluorescent lighting industry reached the $100,000,000 mark faster than any of our great mass production industries. It required 15 years for automobiles and 5 years for radio to reach this volume.

Mr. Thurman Arnold has already given full details on the fluorescent matter in part 1 of your hearings.

In the face of influences long established in the field, the municipal engineer is an isolated individual. There is no force of group organization to put him on committees, no force to give him a hearing,

Digitized by Google

no machinery to lend weight to his needs and his views. The American Public Power Association is attempting to fill this gap, but it is a young organization, barely a year old, just getting started on the big job ahead. It is going to need all the help it can get, by way of research, by way of advice and counsel, by way of the dissemination of information, by way of introducing new devices in order to get them into manufacture—if necessary against the will of the Power Trust—for the public use and the public good.

Building codes, electrical safety codes, and specifications for equipment and materials sometimes are influenced by a particular group or a particular manufacturer. The most serviceable equipment for the least amount of money is not always the goal. With an impartial, independent research agency, such as this bill contemplates, making the results of its studies available in the public interest, those positive forces of competition would see to it that inefficient methods of production were not perpetuated because of corporate greed. We need a disinterested body working for the public safety and public economy to investigate and periodically revise the safety codes.

Nobody can reasonably oppose scientific and technical research which is made available to everyone. Such public study and research will introduce an element of competition with those private agencies and will inevitably result in greater technological advances and improvements all along the line. Experience has proven this time and again. The application of the cooperative technique to rural electrification has demonstrated this well. The private agencies fight to maintain their domination of the particular field, but when others get interested and do something about it, the forced change is beneficial to every one. Rather than doing harm, it is a stimulating influence.

Information coming out of Axis countries indicates they have completely mobilized their scientific and technical resources. Total war demands that we do the same if we are to match the war machine of our enemies.

I would be glad, Senator, to answer any questions that you may have.

Senator JOHNSON. Thank you, Mr. Nau.

I have been handed a list of eight questions by another member of the committee, who was not able to be present this morning, and I would be very glad to submit them to you.

The first question is: Can you provide for the record a brief history of the development of municipal power projects in this country?

Mr. NAU. Yes; I can supply that information, and by way of comment here I would like to point out that municipal power projects are not new. Many people in the country have gotten the idea that public power is strictly New Dealish; that it is something new. On the contrary, my report, which I will be glad to prepare, will show that the first municipal power plant was established in Pennsylvania in 1881; and that at the time of Edison's Pearl Street station, if my memory serves me right, there were seven privately owned systems and one publicly owned system operating. Others were established, for example, at McMinnville, Oreg., as early as 1889.

So that very clearly these municipal power plants are one of the early establishments in our country, indicating that people in the cities and towns felt it desirable, even at that early period, to own and operate their own systems for their benefit.

Digitized by Google

I shall be glad to prepare further information on that for the record.

Senator JOHNSON. We will be very glad to have it.

(The material referred to was marked "Exhibit No. 17" and appears on p. 213.)

Senator JOHNSON. The second question: Approximately how many people are serviced by the 3,000 municipal and State power projects?

Mr. NAU. The municipal plants range in size all the way from, for example, the city of Los Angeles, which last year grossed more than $30,000,000, down to the town of Princeton, Maine, which serves about 500 customers.

While it is true that the larger part of the municipal power systems serve in the smaller towns, Colorado Springs, I believe, has a municipally owned power plant——

Senator JOHNSON (interposing). Yes; and a very successful one; it has been operating for a great many years.

Mr. NAU. I think Mr. Mosely is very proud of the extent to which he has been able to turn some excess profits back into other civic functions.

Senator JOHNSON. Yes; they take care of the tax bill for that municipality to a considerable extent. They not only give very splendid and adequate service in every way, not only keep their plant up to 100-percent efficiency, but they give great assistance to the municipality in taking care of its other obligations.

Mr. NAU. And I think they are making a major contribution to the war now in serving Camp Carson.

Senator JOHNSON. Yes; Camp Carson and an aerial school, as well as an important war industry serving the production of airplanes.

Mr. NAU. While it is true that the larger number of the municipal systems are in smaller towns, we have municipal systems in such cities as Los Angeles, Seattle, Lansing, Mich.; Kansas City, Kans.; Springfield, Ill.; Tacoma; Memphis; and so forth.

As to the specific number of consumers, I doubt whether any up-to-date study has been made to determine the numerical factor there. The latest figures available are for 1937 and are contained in the Census of Electrical Industries prepared by the Bureau of the Census, Department of Commerce. That report shows that in 1937 municipal electric establishments supplied electricity to 2,656,958 customers, and Federal and State projects served 8,473. This would give a total number of customers of 2,665,431. Private companies served the same year 24,432,724 customers. By estimating growth during the last 6 years on the same basis as that shown in the decade prior to 1937, we would get a very rough approximation of 3,000,000 customers served today by municipal, State, and Federal projects. The figures for State and Federal projects are not given separately, so they are included in the calculation, though they are quite small in proportion to the whole and not asked for in the question.

The 3,000,000 figure is customers or meters and not the total number of people receiving the benefits of electric service.

Senator JOHNSON. You have already answered question No. 3: Do these projects cover only the small cities or towns?

The fourth question: Would you explain where the 2,000 projects you mentioned in your statement purchase their power, that is, the 2,000 which do not produce their own power but purchase it?

Mr. NAU. By and large, I imagine the figures would indicate that they buy power from existing private systems, principally, I think,

Digitized by Google

because of the history of the development of the municipal plants. Most of the municipal plants were taken over and purchased from the existing companies, and at the time they saw fit to continue their relationships with the company through a wholesale power contract, in most instances, rather than to install their own generating facilities. So I think that it could safely be said that they do buy primarily from private companies, although a substantial and increasing number of them buy from public systems such as the T. V. A.

As you know, the Tennessee distributors who are buying power wholesale from the T. V. A. are very numerous, there are several hundred of them.

You have the same set-up in the Pacific Northwest, where Bonneville is generating and transmitting power but these public agencies distribute it.

You have that same pattern developing in the Southwest with respect to the Brazos River system and the Dennison Dam, and it is developing in connection with the Santee-Cooper project in South Carolina. There again the public systems, such as municipalities, will buy their power wholesale from Santee-Cooper. And there are instances where small towns are even now buying power from R. E. A.-financed cooperatives, particularly where those cooperatives have their own generating facilities. That is true, I know, in Wisconsin, where they have two fairly large generating plants tied together and feeding over into Iowa.

I think that answers your question on that point.

Senator JOHNSON. It is also true that private distributing agencies purchase publicly produced power?

Mr. NAU. Oh, yes; that is quite true in all those instances that I have mentioned—in T. V. A., Bonneville, and Santee-Cooper, and down in the Southwest.

Senator JOHNSON. Now the fifth question: What influence have the public-power projects had in forcing the private utilities to lower their rates; and the second part of that question is: How is this done?

Mr. NAU. While the private companies have recently, in a Nation-wide advertising campaign, taken great credit for a continual rate-reduction program over the past number of years, the experience has been that that has been brought about primarily through the introduction of the element of competition, competition either by large Federal agencies such as T. V. A.; States agencies such as the Nebraska Public Power System, the Lower Colorado River Authority, or the Grand River Dam Authority; or local agencies such as power districts, public utility districts, municipalities, and electric cooperatives.

Applying that question to municipalities, I think it may be explained in this fashion: When a municipal power plant either constructs or takes over a system, it is immediately in a position to charge rates much more in line with the expenses involved in the production and distribution of the electric energy. There is no need to pay heavily for services from holding companies as might have prevailed in the earlier set-up; and while they are sometimes required, as we have indicated, to plow back funds into other civic functions, yet, by and large, because of the elimination of the watered stock, because of lower salaries all along the line, and other factors, they are generally able to serve their people at a lower cost.

Digitized by Google

There is some difference of opinion in municipal operations. The Canadians generally follow the teachings of Sir Adam Beck, and made it a policy not to allocate profits from the electric systems into other civic functions. We have in this country pretty much followed the English system, and have in many instances plowed back these funds to the point where some municipalities will point out the fact that they have no taxes or very few taxes.

There is a great deal of debate as to the relative merits of the two principles, but the fact remains that with reasonably fair wholesale rates where they do buy power, municipal systems can serve their people well. I have statistics, charts, and graphs in my office to show that the average municipal bill is lower than the average private company bill. I can give you any additional information you want on that.

With respect to the cooperative angle, I believe Mr. Clyde Ellis of the N. R. E. C. has testified on that point, but I may add that while a substantial number of them do buy power from private systems, they have been able so far, in a number of instances, to buy power wholesale and distribute it to their members at rates lower than the company selling them power charges its own customers elsewhere in the community.

There is a case in Arkansas now revolving around that very principle and it is possible because of the favorable terms of the loan, because of the R. E. A. technique of mass building and group purchasing which cuts down costs to the point where rural lines are built for some $800 or $850 a mile instead of $1,500 to $2,200, as was the case when R. E. A. started.

With respect to the T. V. A., I think they may have appeared before the committee, but everyone is fairly familiar with the so-called yardstick application of the Tennessee Valley Authority in connection with the reduction of rates of existing suppliers everywhere.

That same parallel can be drawn in the Pacific Northwest.

The problem in power supply and costs isn't essentially one of generation and transmission. It has primarily been a distribution problem, and I think that is being solved by the experience of the municipalities and the cooperatives; that is, indicating the extent to which they can take power and distribute it to their people at low rates.

But essentially it all boils down to an element of bringing in the aspect of competition into what otherwise is both a natural and legal monopoly. I mean competition in the immediate neighborhood, not competition with respect to consumers in the city, although there are probably some 200 different municipal plants in the country that have competing systems—for example, the city of Seattle and the city of Springfield, Ill., competing systems which are, as both sides will admit, uneconomical and where there should be one system to cover all.

I think that answers your question on the point of reducing rates.

Mr. COLLINS. You mean they compete with the private utility in the same city?

Mr. NAU. That is right.

Senator JOHNSON. Going back to the State of Colorado, we have municipally owned power plants in several of our little cities. Fort Morgan, Colo., not only advertises a better service but they claim to be the best lighted town in all of Colorado, and they also boast that there are no municipal taxes in Fort Morgan. That has caused the question

Digitized by Google

to come up in other Colorado cities. A bond issue is proposed to take over the power plant for a municipality, and rather a bitter contest is held, a bitter debate preceding the election; and I have noticed that, even though the municipality power proposal loses, it usually results in lower rates; that is, during the campaign the privately owned power plant agrees to furnish energy at a lower rate, or, even where an election is threatened, prior to the election the rates will be very suddenly reduced. As far as Colorado is concerned, that is how rates are reduced.

Mr. NAU. Tampa, Fla., just recently had a session of that nature. They have been petitioning for years for lower rates. Nothing happened, and finally they got together and had some meetings to discuss the acquisition of the system, and immediately the Tampa Electric Co. made rather substantial reductions, which met the immediate demands of the people, and it has simmered over now. But that process continues to the point where either they get the rate they want or they take over the system.

Senator JOHNSON. I was told that there is a case in Canada where a privately owned power plant showed that they could operate with lower rates than publicly owned power distributors. It would seem to me that there would be no question but what a privately owned power plant and distributing system could compete with any publicly owned plant that you could bring into existence, except that they just don't do it.

Mr. NAU. The principles of operation are the same; it is strictly a question of return and ownership.

Senator JOHNSON. There is nothing magic about public operation.

Mr. NAU. Nothing at all.

Senator JOHNSON. In fact, the handicap is the other way.

Mr. NAU. That is one of the things that is a current pre-bond-issue election topic, the ability of the people themselves to own and operate the systems. It was the story used against the R. E. A. electric cooperatives—that the farmers just didn't know enough, weren't intelligent enough, to understand and manage their own affairs with respect to the distribution of electric energy.

But the question of rates, I think, is the critical factor. If a company is not overburdened in its stock structure, has good operating personnel, and its plant is reasonably new and modern, they can do a good job, there is no question about it. But the fact that you have so many public systems coming into being indicates that in many, many cases the job has not been done, rate reductions have not come along as they should have in proportion to the technological advances, and you have the people turning to their own systems.

That ties right in, if I may add, Senator, with this bill, because the municipalities, by and large, do not have research facilities to help them in these problems. I would imagine that there are less than a hundred cities that have any research or study facilities at all with respect to the problems they meet in the operation of their plants.

Senator JOHNSON. The sixth question: Would you describe some of the techniques and forces which have impeded public power development? You have partially answered that question already.

Mr. NAU. If we counted all the cooperatives and all the new power projects publicly owned, you would have a ratio of something like 80

Digitized by Google

percent privately owned and 20 percent publicly owned in the whole Nation.

Naturally, the operators of the 80 percent are interested in maintaining their position in the field. That is perfectly understandable. To my knowledge, they haven't missed a trick in their efforts to maintain that position, to the point of completely negating and controverting the will of the people, through injunctions, through court processes, through delay. For example, in Geneseo, Ill., they have had a case pending for the last 8 years, which has been appealed and reappealed from the court to the Commissions, and back and forth, circumventing the will of the people to buy out the competing system. Geneseo has been stopped until recently—as a matter of fact, the Commission has just issued an order saying, in effect, that the people may acquire the system. The power company now contends that that is not mandatory, and will fight the order of the Public Service Commission of Illinois, probably through the courts again.

But in addition to such opposition as that, of course, we have the whole range—with which I think the subcommittee is familiar—of opposition tactics that are a matter of common knowledge throughout the country, at least common knowledge on the part of people who are interested at all in the social and economic aspects of cheap electric power.

Unquestionably there are other instances where these municipal plants and the people involved do not have access to the technological improvements that take place in the industry, and there again I think that making available and bringing into play the competitive forces with respect to patent rights that this bill would do, would have a very beneficial effect on municipal operation and on any other public power operation.

There are unseen methods of opposition. Others here recited the case of the cyclometer meter. Also mentioned very briefly was the matter of transformers and their price.

The rate base is founded upon plant investment. Of course, if that plant investment is high you can charge a high rate, particularly if your regulation provides for a fixed percentage.

Too frequently we have gone into equipment, material, and instruments that, I feel, could be made to cost less—at least that has been our experience in R. E. A.—and could be made to serve the needs without the quantity of material or the price attached to them. I know that was true of the meter and the transformer at R. E. A. It was true of the whole line itself, as was indicated by the record there.

Senator JOHNSON. Could you give the background and explanation of the public power situation in Omaha?

Mr. NAU. That is another indication of the extent to which the power-company operators—in this case the Nebraska Power Co.—have gone to oppose the application of the Public Utility Holding Company Act of 1935, commonly called the "death sentence," and oppose the will of the people with respect to a determination as to whether or not they want to serve themselves with electric power.

Nebraska is the one State in the Union which has all publicly owned electric utilities, except the city of Omaha and five surrounding counties. That property is owned by the Nebraska Power Co., an affiliate, I believe, on up the line of Electric Bond & Share—these pyramids get

Digitized by Google

so complicated that I can't possibly remember them, I have a chart in the office that would indicate it, though—but that company, as I understand it, is required to divest itself of these properties, and there has been a move afoot in Nebraska on the part of the other publicly owned systems, the Nebraska Public Power System, the Loup River System and the Consumers, to effect legislation to acquire that in the interests of the people of Omaha.

As I understand the picture, the Nebraska Power Co. immediately proposed—and this again is common knowledge in Nebraska, although I don't think it has been outside—proposed the introduction of a bill, LB–204, to set up a Nebraska Power Authority, purportedly to be a public agency, with all the advantages and attributes of public ownership, to buy from the Nebraska Power Co. and operate the properties in Omaha and the surrounding counties.

The legislation was peculiar because it was identical with a bill proposed in the State of Colorado, with which I believe you may be familiar.

Senator JOHNSON. I am very familiar with the proposal there to take over the Public Service Co. There was quite a controversy in the Colorado Legislature and they have appointed a committee to investigate the whole matter

Mr. NAU. Getting back to the Nebraska case, the bill upon examination, on the part of public-power people and the public generally, was found to have some very serious drawbacks, if you were aiming for the benefits of public power. There was no limit on salaries, there was some question as to the provisions of the bill whereby the officials would be responsible to the will of the consumers and the people. It had an unusual provision in it, as I remember, providing for the mortgaging of public property, which is almost unknown in public financing.

Senator JOHNSON. And in Colorado the price to be paid for the privately owned company was not to be determined in the usual manner, they were going to take over this property at an excessive cost, which would have an immediate effect upon the rates.

Mr. NAU. That is right. Of course, they will do their best. In the Northwest the Puget Sound Power & Light has been demanding a terrific price for its properties up there.

Senator JOHNSON. In other words, in Colorado the proposal was for the State to take over the watered stock of the Public Service Co.

Mr. NAU. That is precisely it. But essentially what happened, then, in concluding the Nebraska case, LB–204 was finally passed, after much opposition, but amended substantially to knock out some of these more objectionable features.

Now, there is a rumor in Nebraska that the company may not exercise its permissive authority under this bill to sell the properties to the Authority, and the people of Omaha who looked forward to lower rates under operation by the Authority, are becoming disturbed as to whether it had any meaning or not.

That is the Omaha picture as accurately as I know it.

Senator JOHNSON. How, in your opinion, could the office proposed in S. 702 avoid what you refer to as the chloroforming of technological advances?

Mr. NAU. Well, I am a great believer in the positive forces of competition, and that goes for other industries even more so than the elec-

Digitized by Google

tric-power industry. By competition with respect to electric power, I mean competing agencies such as T. V. A. and the cooperatives and the municipals, which provide some measurement of performance.

As I say, I think many of the rate reductions that have taken place have been largely attributable to competition.

But if there were set up through S. 702 an Office of Scientific and Technical Mobilization, providing a means whereby the vast body of research, technical study, and progress that is now going on under Government auspices—for example, in the Bureau of Mines and under the various agricultural branches out through the States—in all fields of industry, if there were some means whereby you could bring into the stream of competition, without the restrictions that the present patent system sometimes imposes—that is, bring into the stream through the making available of these patents through this Office—you would introduce a very healthy element of competition. It would benefit the inventor, it would benefit the people, and it would have a very salutary effect in stimulating, as I have indicated, additional study and research to keep up with the progress being made in the field.

There was more rural electrification done on the part of the private companies as the result of the institution of the R. E. A. than they had done in many preceding years—sheerly because of the element of competition.

Senator JOHNSON. I agree completely with that statement. That has been my observation, also, just precisely the way you have stated it.

Mr. NAU. I think too frequently we have gotten to the point where the courts may almost be said to be policing our patent system, and perpetuating the restrictive control of patents, far beyond the original aims of the patent system.

I can see an opportunity in this bill for making many of these advances—we are in the age of technology now, technology is the very cornerstone of progress. I can see an opportunity for making technological advances more readily available to the public. A number of instances, I think, could be compiled at leisure in which old equipment has been kept on the market because of patent controls over newer devices which might have seriously affected the extent to which, for example, some company dominated the particular field.

Again, I think Mr. Arnold has pointed out the fight on this fluorecent light case which is definitely applicable to the power business and we are indebted to Mr. Arnold for his efforts. The Sylvania people, very aggressive in the beginning, ran into terrific obstacles, and I think now, even, are operating under assignment of patents from the General Electric Co.

I see a splendid opportunity in this legislation to go right down to grass-roots Government, namely, the people who are operating their own municipal systems, and provide for them something very essential to a good, efficient operation of electric power systems.

Senator JOHNSON. That concludes the group of questions submitted to me.

I would like to have you enlarge upon your statement just a little. You said:

"Experts admit we are only on the threshold of the 'electric age'. That age can be made to serve man to its fullest extent only if 'free enterprise', in its original and true meaning, is made to work."

Digitized by Google

I would like to have you enlarge upon that just a little. It seems contradictory on the face of it for one who is advocating public ownership also to be advocating free enterprise.

Mr. NAU. That is a very logical question, and I think it has a very sound answer. I was speaking there of free enterprise in its broad meaning. That is, the elements of competition coming into play so that we get the beneficial effects of competition, which is the foundation of our capitalistic system. But the elecric power indusry, as an industry, is in itself a monopoly, natural and legal, and I think it has been proven that the best possible service can be rendered under conditions where you have one agency serving the people.

When I spoke of competition in the electric power industry, I meant exposing a system to the influences of competition near enough geographically to have some effect. I didn't mean within-city competition such as in the city of Springfield, Illinois.

When I use the term "free enterprise" I mean to use it in its broad meaning.

Senator JOHNSON. What is its broad meaning? It only has one meaning to me, and that is neither broad nor narrow, it is fundamental, and I would like to know what you mean by its "broad meaning" and "narrow meaning."

Mr. NAU. I mean not particularly applied to the electric utility industry. This bill will be concerned with every aspect of industry, as I understand, and I see in it an opportunity to bring into play those elements of competition which are basic in our system of free enterprise. I mean price, quality, service, with all other elements, and delivery to the consumer the best possible materials and equipment at the lowest possible price.

Senator JOHNSON. Well, your answer is not very clear to me, as to exactly what you have in mind. But perhaps this question will clear up what I am trying to bring out:

Do you believe that if all distribution and production of electric energy was publicly owned, that that would be a good thing, or do you think that the fact that part of that is privately distributed and that it is all mixed up, that you bring in the element of competition and thereby get better services and better rates?

Mr. NAU. Regulation generally, as is a known fact, has been quite difficult. We have the State commissions that were set up under various authorities, with certain statutory powers to regulate and control the generation, transmission, and distribution of electric power. But in many instances that regulation has partially broken down to the point where the record will show that you have had an almost insignificant amount of rate reductions brought about by a State regulatory agency acting on its own motion.

Senator JOHNSON. I agree with that statement completely, but the point is, by having these yardsticks in both distribution and production, I don't think anyone can deny that it has resulted in lower rates.

Now, suppose you do not have the yardstick, suppose you have complete public ownership of distribution and production, then what about the service and what about the rates when you eliminate the element of competition? Would that or would it not be a good thing for the public?

Mr. NAU. It is strictly up to the people themselves. If you can maintain public interest in that function—for example, just as the

Digitized by Google

grain and feed cooperatives maintain consumer interest in their functions—which is conducive to good management, I think it can be done.

Senator JOHNSON. Yes, but they have competition, and very severe competition. When you remove the total element of competition from the picture, what is going to happen?

Mr. NAU. Of course, that is the case now. That explains my statement a while ago. In the city of Washington, you have a complete lack of competition in the generation, sale, and distribution of electric power.

Senator JOHNSON. But you have the threat, perhaps, of municipally owned or publicly owned power.

Mr. NAU. Yes, it is there; but there is no competition, as I think of competition in terms of, for example, the automobile industry.

Senator JOHNSON. No; it has to be a monopoly to a certain extent, of course, we realize that.

You don't have competition between A and B, both A and B being private institutions, but you do have competition between the threat of public ownership on the one hand, and private operation on the other.

Mr. NAU. My personal opinion is that, as evidenced by the city of Los Angeles and the type of service, rates and the management there, that if you have complete public ownership of electric facilities, and techniques whereby the interest and the will of the people can be maintained in the operation of those systems, and advantages for all the technological improvements that take place in the industry being made available to these public systems, I think you can have just as efficient operation, and in many cases more efficient operation, than you have under private management.

Senator JOHNSON. Well, there are a great many "ifs" in your answer.

Mr. NAU. Of course, you are dealing with human beings, Senator. But with the proper technical help to run their business, they can, as has been proven time and again, be very successful. Public power isn't anything that you have got to propagandize. It is a fact, as Mr. Dirksen said the other day in the House, "Public power is here to stay, it is like administrative law."

Senator JOHNSON. I agree with that statement, but maybe private power is here to stay, too. I hope it is, I hope you have the two of them operating side by side.

Mr. NAU. Well, side by side in terms of what we said a while ago; not side by side, for example, in one city.

Senator JOHNSON. No; I don't mean in one city, I mean city A having a private operation of power, and city B having a municipal operation—and in that way I think that the municipally operated power plant becomes a yardstick.

Mr. NAU. Don't you think eventually, then, you will have, through normal economic processes, a complete change of ownership, like that in water systems?

Senator JOHNSON. No; I don't think that, necessarily. I think that a private power plant, if it wanted to, could compete with a publicly owned power plant any time, any place.

Mr. NAU. I think there is an "if" there.

Dr. SCHIMMEL. Wouldn't you say if it had to, not if it wanted to?

Digitized by Google

Senator JOHNSON. Certainly, I am saying that it is possible, I am not saying that it would do it. And in the back of my head I remember that there is a company in Canada that has stayed through and competed with public ownership right along, and has made a profit and rendered fine service, and has met every condition of public ownership.

There is no magic in public ownership at all. You have to operate on the same economic principles and there just is no reason to believe that public ownership could be more efficient than private ownership.

I wouldn't take that position, perhaps, if I had not been confronted during the past several years with a Government monopoly known as the War Department. I know that the Ordnance Department has done exactly what private industry has done in holding back improved techniques, submerged them and kept them out of the picture—kept them from becoming effective, just as private industry has. So I don't have too much confidence in what public ownership will do if it is left to itself and if it doesn't have competition from private industry.

In other words, I am not a Socialist. I believe in public ownership to a certain extent; I think it is a fine thing. It has been a wonderful thing in Colorado. It has brought the rates down. But I would hate to see Colorado go all the way and drive out the private operation of power production and distribution. I like to see the dual system.

Mr. NAU. Of course, you have the same principles at play there that you have between the Federal and State Governments. I think your checks and balances are very real factors.

Senator JOHNSON. But that is getting quite a ways away from our bill.

Are there any other questions?

Mr. COLLINS. Can you describe some of the technological and research assistance that the public power systems could use?

Mr. NAU. There has been considerable controversy, for example, in street light design. When the incandescent system came in and superseded the arc system, for a long time the municipalities were buying arc systems, when a far more efficient and effective incandescent system was available. If at that time there had been available to these municipal engineers completely independent scientific data with respect to the most effective, economical street lighting system then on the market, not what any particular manufacturer had to sell, I think it would have been highly beneficial.

Mr. COLLINS. There is no place that they can go now for a central clearing house on new techniques?

Mr. NAU. That is what we contemplate after our association comes of age. We expect to appoint various committees to conduct research on these various technical problems, and make that research available to our people. That is a long way in the future, but we are aiming in that direction.

Mr. COLLINS. Have you another example?

Mr. NAU. As a result of the speeding up of technological processes during the war, I visualize a tremendous increase in new applications of electric power. For example, dehydrating equipment on the farm. Unquestionably much of that equipment will save energy when compared with the old equipment. I would hate to see it kept off the

Digitized by Google

market simply because it used, say, 50 percent less current than older equipment.

Mr. COLLINS. You spoke in your statement about the apparent domination by certain corporations of the American Institute of Electrical Engineers. Can you make that more specific, or can you supply the committee with any evidence of that?

Mr. NAU. I think I could give you more detailed information as to the different committees and who is the head of them and their affiliations, if you would like to have that.

Mr. COLLINS. That would be very helpful. If you could supply it, it would document this statement, which otherwise is undocumented.

Mr. NAU. I would be glad to.

(The material referred to was marked "Exhibit No. 18" and appears on page 214.)

Mr. COLLINS. I don't want to suggest any elaborate documentation, but you also said:

> A careful review of the Federal Trade Commission reports of 1934 on Utility Corporations will reveal, in part at least, the extent to which State research agencies and even individual college professors, were influenced by the vast and sometimes subtle powers of the electric utility industry.

Is there any way that you can briefly document that for the record?

Mr. NAU. I might get that—it is a long work—and I think I remember offhand a few cases.

Mr. COLLINS. A summary in a few pages might be helpful.

(The material referred to was marked "Exhibit No. 19" and appears on p. 215.)

Senator JOHNSON. Just political rather than technical?

Mr. NAU. Oh, I think it was both.

Senator JOHNSON. I know there has been a very strong political influence along that line, but I didn't know that it extended into the technical field.

Mr. NAU. I am not too clear on the technical side——

Senator JOHNSON (interposing). For the purposes of this bill, we would be more interested in the technical side of it.

Mr. NAU. Yes.

Senator JOHNSON. I think the principle is pretty well established. Are there any other questions?

Dr. SCHIMMEL. I want to get that research situation a little clearer. Who does most of the research in the electrical field today?

Mr. NAU. It is done, I think, largely by both the manufacturers and the utility companies, and their various associations, such as Edison Electric Institute.

Dr. SCHIMMEL. Have you ever checked on the actual number of research workers in the various phases of the electrical industry? I think the bulk of the research is done in the manufacturing industry, is it not?

Mr. NAU. I think that would be a safe estimate, although I have never checked as to the numerical aspect.

Dr. SCHIMMEL. What are the relations of the Public Power Association with manufacturers?

Mr. NAU. We have established practically none; we have been operating only about a year and up to the present time, as an association, we have been digging a foundation.

Digitized by Google

Dr. SCHIMMEL. What are the relations of the municipal power systems with General Electric, for example? Are there any firm relations there so that the problems brought by the municipal power stations to GE are studied? Has that ever been tested?

Mr. NAU. I don't know whether that has been tested and analyzed. Offhand, I would imagine—and this is a very general statement—that they do not; being a relatively insignificant portion of the total market, they would not carry much weight compared, for example, with the weight that a billion dollar utility corporation might have with G. E.

Dr. SCHIMMEL. The impression your testimony gives—and you may correct me—as well as Mr. Ellis', is that the manufacturing companies are affiliated financially with the public utilities, and, therefore, the manufacturing companies, who do the bulk of the research, are hesitating to bring out new developments which will cut into the income of the utilities.

Now, presumably, the public-power systems would be hindered by the same factors——

Mr. NAU (interposing). I shouldn't think so. That again gets back to what the Senator said awhile ago with respect to competition.

Senator JOHNSON. As a matter of fact, there is real competition between the manufacturers of electrical devices—Westinghouse, Edison, General Electric?

Mr. NAU. Oh, yes.

Senator JOHNSON. I don't entirely agree with your testimony that the municipally owned distributors and producers suffer because of any special privilege that is being extended to the private distributors and producers.

Mr. NAU. It is awfully difficult to measure, it is one of those unseen things, but the sheer element of size alone has been a factor. If you are a vendor of equipment and you sell 80 or 85 percent of your goods to one person, and 15 percent to others, you can imagine——

Senator JOHNSON (inteposing). There are no market restrictions, however, in the purchase of equipment.

Mr. NAU. None.

Dr. SCHIMMEL. The thing I am concerned with is: Do your public-power systems bring proposals for research developments to GE, and are they carried out?

Mr. NAU. I imagine that has been done, but, as I say, I have been there only 8 or 9 months, and we haven't gotten into that. I couldn't speak of my own personal knowledge.

Senator JOHNSON. You wouldn't have peculiar problems; your problems would be the same as those of private industry?

Mr. NAU. Technically speaking, precisely the same.

Mr. SCHIMMEL. But they have made the point, Senator, that the private industry hesitates to bring to the General Electric Co. proposals which will involve eventually reducing the total amount of power, and that is readily understandable——

Senator JOHNSON (interposing). I don't think it is readily understandable. As a matter of fact, I just don't believe it; I don't believe that there is anything in that argument at all. I think it is just someone's opinion. I don't think it can be supported. I don't think the facts will support it in any degree.

Digitized by Google

Mr. COLLINS. Have you any facts that would support that statement in your testimony?

Mr. NAU. No; I do not. The fluorescent case, which has been covered rather completely, is one example which may be in point.

Senator JOHNSON. Are there any other questions?

(No response.)

Senator JOHNSON. If not, the committee will stand adjourned subject to the call of the chairman.

(Whereupon, at 11:50 a. m., the committee adjourned, subject to call.)

EXHIBIT No. 17

HISTORICAL NOTE ON MUNICIPAL POWER PROJECTS IN THE UNITED STATES

Development.—A brief history of the development of municipal power projects in this country as background material obviously cannot cover more than the highlights, going back as early as 1881. No attempt is made to give details but this brief statement will enable the uninformed to appreciate the problems of this small segment of the public power field.

Municipal power plants came into being for two main reasons: First, a desire on the part of the public for electric service in their community in the absence of nearby power lines from which extensions could be made; and second, extraordinarily high rates for service which inhibited wide use of power and kept consumption down. On this point a study of statistics will show a very real and positive relationship between the price per kilowatt-hour and the consumption. As the price drops, consumption increases.

The first municipal plant—the first public power system in this country—was established in Pennsylvania in 1881, followed the next year by additional plants in Ohio, Michigan, Iowa, and Kansas. At the time of Edison's Pearl Street station in 1882 there were 7 privately owned electric systems in operation and 1 publicly owned system. Municipal plants continued to increase in number until they reached a total of 3,066 in 1923, concentrated for the most part in the west north central section. The number of plants has not remained constant although today there are still approximately 3,000 in operation, roughly 300 of which are in competition with privately owned systems.

Management.—The fact that municipalities are political subdivisions of a State naturally has had an influence on the management problems of the electric utilities. Generally speaking, administration of the electric systems comes under a board or commission usually selected by elected officials. There are many varying kinds of municipal plant administrations, but generally the policy-making officials compose a board which is responsible for employing a manager and additional personnel as may be required. In small communities, village clerks, or other such officials are frequently responsible for the operation of the power plant. In the larger systems technically trained and experienced engineers are employed together with a complete construction and operating organization. The manager usually has complete authority for all operations within the general policies established by the controlling board.

Statutory authority.—The little history that has been written in this field reveals, however, a definite lack of proper and uniform statutory authority for efficient operation of municipal power plants. Much of this has been due to those interests which consistently oppose the legislation favoring the principle of public power, such as those involving boundary and franchise restrictions, power to issue self-liquidating securities, and so forth.

Financing.—Prior to 1925 general obligation bonds, a direct obligation of the city, was the general method used to secure the necessary capital. These bonds were supported by the taxing authority and provided a lien on taxable property. Since 1925 so-called revenue bonds have become more generally used until today they are preferred a method of financing. These bonds, usually payable serially, are secured by net revenues, and provide no lien on the physical properties.

Many municipally owned systems have fully paid off their bonded debt and while complete data is not available a recent study of 756 municipally owned utilities, scattered all over the country, revealed that 39.4 percent were entirely

Digitized by Google

debt free. The effect on rates in the absence of debt service requirements is obvious.

Regulation.—In most States certain regulatory powers are delegated to a public service commission or other State agency which is empowered to grant franchises or certificates of convenience and necessity in the public interest. Also, the laws of some States on the rules of the public-service commissions require that uniform accounting systems be followed by public, as well as private plants.

Rates.—Up to 1925 there was a noticeable change from the old system of flat rates to the promotional type rates now available to all consumers of electric power. Although a direct comparison of rates between municipal and private systems is difficult because of the many varying factors, the Federal Power Commission report for January 1, 1943, comparing lowest and highest typical electric bills shows that—with one exception—the lowest bills for residential service in cities of 50,000 population and more were those rendered in communities served by publicly owned utilities while the hihgest bills were those of privately owned utilities.

The rate problem has been affected by the tendency on the part of many municipal plants to allocate surplus funds to other civic functions, thus reducing the over-all tax rate but delaying the number of rate reductions which consumers might normally expect. The latter plan has also been encouraged by the private companies because it results in higher over-all rates.

Taxes.—While it is true that mupicipal power systems do not pay all Federal taxes, they do render free public services, and make payments in lieu of taxes which usually exceed the amounts which are required under private ownership.

Physical plant.—Under existing methods municipal systems have not been subject to integration in the same manner as private company facilities; consequently technological advances in the transmission and distribution of electric energy have not had the effect on municipal systems that they have had on private systems. A few municipalities do serve other municipalities, but generally they are isolated generation and distribution, or merely distribution systems, surrounded by lines of private companies which may be serving adjacent territory. A rough estimate would seem to indicate that some 1,000 of the 3,000 municipal systems generate their own power. The rest buy power either from public or private sources.

Research facilities.—I do not believe that there are a hundred municipal plants that are large enough to afford their own research laboratories and facilities. As the average municipal plant is comparatively small it should therefore be noted that much of the research and study conducted in the field by private systems and manufacturing groups is not readily made available to the average municipal plant.

EXCERPTS FROM FEDERAL TRADE COMMISSION REPORT ON UTILITY CORPORATIONS (DOC. 92, PT. 71A, 70TH CONG., 1ST SESS.)

UTILITY COOPERATION WITH THE SCHOOLS

The utilities' aim in giving attention to educational institutions, as stated by the Illinois committee on public utility information, "is to fix the truth about the utilities in the young person's mind before incorrect notions become fixed there."

Digitized by Google

The Illinois committee pioneered in this field. By 1922, however, the National Electric Light Association had taken up the plan. Acting apparently on the proposal of Samuel Insull, who earlier had emphasized "the great need of a campaign of education in the colleges and other institutions of learning," the national association in December 1922 appointed a committee on cooperation with educational institutions. In accordance with suggestions from this committee and benefiting from the success of the Illinois plan, work in educational institutions was undertaken by State committees in Indiana, Pennsylvania, Colorado, Wyoming, New Mexico, Wisconsin, Oregon, and other states.

With the schools as with the newspapers, public utility officials realized the necessity of creating good will. This was done in a variety of ways. Deliberate cultivation of friendly relations with school and college men often did the trick. In other cases, where caution was necessary, a roundabout approach was used. In Texas in 1923, for example, the utilities were "feeling their way into the schools with the Constitution." Definite pains were taken to obtain the approval of college professors. Referring to teaching as one of the "starveling professions" (the others, the church and the press) Dr. C. A. Eaton, president in 1924 of the American Educational Association and a General Electric Co. industrial relations manager, advised the National Electric Light Association convention "to give thought to the teachers and when their vacation comes pay them a salary to come into your plants and into your factories and learn the public-utility business at first hand," M. H. Aylesworth, then managing director of the National Electric Light Association, put it this way: "* * * Once in a while it will pay you to take such men, getting five or six hundred or a thousand dollars a year, and give him a retainer of one or two hundred dollars per year for the privilege of letting you study and consult with him. For how in heaven's name can we do anything in the schools of this country with the young people growing up, if we have not first sold the idea of education to the college professor?"

This pointed advice was widely accepted. Professors of journalism of well-known universities, directors of cooperative Federal and State extension in agriculture and home economics, *faculty members from outstanding private universities and research institutes cooperated in various ways with the State utility information committees.* Cooperation was gained in many cases with faculties in institutions of higher learning. In many colleges and universities courses of study were established which appeared to be sponsored by faculty members but which *were, in fact, suggested by the utilities. Funds for the support of research scholarships were received by many institutions.* Elementary and college textbooks were surveyed to determine their attitude on the electric and gas utilities. In some instances information given out by the State information committees was utilized in correcting the viewpoints of books considered bad or unfair. In other cases, new or substitute texts were prepared and introduced into the public schools. Educational authorities in certain States were approached directly in order to improve the textbook situation. In numerous cases, thousands of pamphlets presenting the utility point of view were introduced by the State committees into public schools. [Italics supplied.]

See appendix 12 of same report (p. 426) entitled "Compilation of Payments by Utilities to Educational Institutions and Educators."

Also see section of same report entitled "Educators and Schools" (p. 139–221).

EXHIBIT No. 20

ADDRESS BY ALBERT PARSONS SACHS AT THE MEETING OF THE ASSOCIATION OF CONSULTING CHEMISTS AND CHEMICAL ENGINEERS, INC., NEW YORK, N. Y., APRIL 26, 1943

Mr. President, members of the association, and guests: I have been instructed to present a report on the Kilgore bill, S. 702, of the Seventy-eighth Congress, first session. I have not taken my instructions lightly and I have devoted time and consideration to the task.

We have been told by Senator Kilgore that this bill is so essential—I hesitate to say it—that the future of the Nation practically depends on it. We have been assured by some of our colleagues, both within and outside of this association, that the Kilgore bill will deprive us of our rights, our livelihood, our economic position; that this bill is worse—mind you, not equal to but worse—than communistic, combining, it is alleged, the worst features of both the capitalistic and the communistic systems.

As I shall point out more fully later—and why—we make our decisions in matters of this kind first and then hunt for reasons to support our decision. And a lot of people simply refuse to read the plain provisions of the bill, as if they were afraid that a simple reading might soften their opposition. This method of rationalization is not the exclusive habit of chemists, of course; it is the penalty of being able to think at all. I venture to believe that with respect to this bill most of us have opinions already which no amount of discussion will alter. We behave, in fact, quite analogously in our thought processes to those millions of southern white gentlemen who have voted the Democratic ticket ever since the Civil War. To them a Republican vote would be insane on the one hand and treasonable on the other. Formally they pledge allegiance to the Democratic Party while in practice they frequently sabotage its policies. Is this unreason also true of us, northern as well as southern, in other matters than politics?

But I do feel that our society, our American way of life which is our society, is a living, evolving institution, that its success as a mode of life is due primarily to its adaptability to the changes in our life. I look upon the greatness of our beloved country as rooted deeply in our ability to adjust ourselves and our institutions to a changing world and changing conditions. Our country in its beginnings was primarily agricultural; it became profoundly industrialized and then industry became firmly based on science, on investigation, and invention. We must change our institutions to meet these changed conditions.

Let us take an example. The Department of Commerce used to deal with problems concerning labor. But the problems of labor, particularly in view of the industrialization of the country, became more important. So Congress by an act effective March 4, 1913, created a Department of Labor. Of course there had been opposition to this change but no one today would want to turn back the march of time and abolish this Department.

I believe with all the fervor of which I am capable, I believe as a citizen, I believe as a scientist, I believe as a member of this association, that the time has come for the establishment of a Department of Science and Technology. I do not expect this Department to spring into being full formed but I do believe that the Kilgore bill is the first important step in the direction of a Department of Science and Technology.

Some of you have perhaps read articles by David Lawrence who writes the principal editorials for the United States News and also writes a daily article for the New York Sun. Neither of these publications nor Mr. Lawrence could be justly referred to as radical; in fact, if they should be permitted to name their own description, "conservative" would be their own description of choice. Others might even call them reactionary.

In discussing the Delano plan contained in the report of the National Resources Planning Board in his editorial in the United States News for March 26, 1943, Mr. Lawrence says: "Many observers have read excerpts from the Delano plan and have condemned it as a piece of state socialism. Others have referred to it

Digitized by Google

as a plan for Utopia. The Delano plan ought to be read and studied carefully not as a formula for handling either the transition period that will immediately follow the conclusion of hostilities or as a blueprint for the post-war era. It is neither. It is a provocative report designed to stimulate the thinking of the American people, and particularly of our molders of public opinion and legislators, on the tremendous problems that lie ahead. We have too long in America been prone to dismiss intolerantly anybody with a plan for social betterment just because it might hurt our pocketbooks or interfere with our preconceived theories of how life should be ordered under a highly individualistic system. That has been called laissez-faire but a better name would have been Micawberism—always waiting for something to turn up to solve ills that we refuse to face. The time has long passed when we can permit in America the abrupt turning of the key in big factories as depression occurs and assume that the small towns and communities and even the sparsely populated States will suddenly take care of the unemployment problem created by the impact of national and international influences of an economic character far removed from these towns and villages. Totalitarianism came to Europe, whether under fascism or communism, because of economic disorder. This arises when representative government fails to represent the people, when democracy fails to organize itself for action within its own borders—in short, when everybody's business becomes nobody's business. There is a place for the individual and for the State in economic society, but the blending of these two obligations cannot be accomplished through over-emphasis of one or the other." * * *

I neither approve nor disapprove of Mr. Lawrence's remarks. I feel that I can fairly quote Mr. Lawrence's masthead which he runs above every editorial, the immortal words of Voltaire: "I wholly disapprove of what you say but will defend to the death your right to say it."

We have our journals and I sometimes wonder whose opinion the editors represent in their editorials. In the April issue of Industrial and Engineering Chemistry, the editor attacks the Kilgore bill. I wonder—and I say this not cynically but inquiringly—how he arrived at the conclusion that the chemists of our Nation, the rank and file of our profession, the men with small salaries and a little glory, oppose this bill. I do not wish to be personal, but contact with the Washington office of the American Chemical Society, with advertisers, with the big names of chemistry is not precisely the way to learn the wishes of the rank and file. And I do believe that if a referendum is taken of the opinions of all chemists, of the poorly paid employees as well as of the more successful and highly placed, the result will shock those who assume that naturally all scientists and technologists oppose the Kilgore bill.

But just as I have felt it advisable to criticize the American Chemical Society's assumption of right to speak for the chemical profession without consulting the membership, I must in fairness state that in the News Edition for April 10, page 508, there is an unbiased because uncommented report of Judge Arnold's testimony before the Subcommittee on Technical Mobilization of the Senate Military Affairs Committee in support of the Kilgore bill. I quote the News Edition: "Highlight of 'Trust-Buster' Thurman Arnold's appearance in support of the Kilgore bill (S. 702) was the statement that the measure is 'the Magna Charta of Science.' The former United States Assistant Attorney General in charge of the Antitrust Division, Department of Justice, and now a Federal judge, was the only witness called at the special hearing. 'I assume,' said Judge Arnold, 'that I have been subpenaed to testify before this committee because of my experience with the abuse of patent privileges by domestic and international cartels. The evidence is overwhelming that practically all our shortages in basic materials and in chemicals, the very things that are necessary to give us strength in war and wealth in peace, are due to the control of research and invention by domestic and international cartels. If the committee cares to go into detailed hearings it will find that the production and distribution of such vital elements as magnesium, zinc, rubber, aviation gasoline, beryllium, titanium, electrical equipment, plastics, dyestuffs, machine tools, fuels, communications, and a variety of other products necessary for both our war effort and our industrial progress have been impeded and delayed, and in some cases totally blocked, because private groups dominated industrial research. To break that control, to free our economy, in the new industrial age which every forward-looking technician believes is coming, as well as to speed up the war effort, we must break up the patent pools which put barriers against independent initiative in research and invention. But this alone is not enough. The patent itself is only an instrument of aggressive warfare to stop invention by persons not employed by

Digitized by Google

our great cartels. The control of "know-how," the knowledge of results of basic experimentations is even more important than patents. Out of that control patent monopolies get their start. It is the foundation on which patent pools are built. The bill is designed to break the corner on research and experimentation now enjoyed by private groups.'"

I tell you it is my considered opinion that science is only at the threshold of its greatest advances. I tell you that science and technology are about to change the face of the earth and the ways of life of all mankind. I tell you that under our capitalistic democratic system of unfettered enterprises we are unprepared to take full advantage of these advances because the sole motive of our capitalistic system is the creation of profits—profits actual and profits reasonably potential. This is no reflection on capitalism any more than it is a reflection on elephants to say they have trunks or on tigers to say they have stripes and are carnivorous. In each case it is merely the nature of the animal. Capitalism has great achievements to its credit. Yet it is incapable of solving all of our problems. One of the problems it has not been able to solve is the production of materials and equipment which may be necessary for the very life and safety of the Nation, the production of which may be unprofitable.

Let us take synthetic rubber. We, the chemical profession, have known since before World War I that synthetic rubber could be produced—but probably not profitably in competition with natural rubber. We did not expect, we could not expect, the capitalistic production system to give us the necessary synthetic rubber we needed as a matter of life or death in case of war. But when war came, we, the people, through the Government we had freely elected, went about producing the necessary synthetic rubber, plants for the raw materials, plants for the condensations or polymerizations necessary, and we shall have the production—several years late. And let us not deceive ourselves; the production is being achieved not by the capitalistically organized companies but by our Government. It provided the money, allocated the construction and manufacturing materials, and provided the raw materials. This I submit to you is the actual working of the set-up envisioned by the Kilgore bill; this is an unofficial, unplanned Kilgore plan. What has been done is to advance the cause of technology without regard to cost or profit, and with regard only to the national welfare. Why in the name of all that is reasonable do we have to wait for a war to compel us in a moment of danger to do precisely what we could just as intelligently and more usefully do in time of peace as well as in time of war Let us not forget that the issue is not capitalism or anticapitalism, but survival and development of our America. If a noncommercial post office fills our communications requirements best, let us continue to have a nonprofit-making post office. If a department of science and technology will serve our national needs better, let us have it.

It is customary to speak of the great advances made under the capitalistic system and to claim that all these advances are due to the capitalistic system. It is a little difficult to accept this interpretation. While I have no wish to set up the Soviet system as a guide for us, anyone who is at all familiar with scientific advances made in the Soviet Union—incomparably greater than under the Czarist regime—will have to admit that great scientific advances can take place under either the capitalistic or socialistic system. I believe the problem is too complicated to be described merely in terms of the economic system prevailing. I have no doubt that the economic system has an effect on the progress of science and technology, but I think each economic system can lead to progress, although predominantly in different directions. For example, I believe the production of gadgets will thrive best under the capitalistic system, while fundamental research will thrive best in the atmosphere of socialism. I must point out that in discussing the Kilgore bill, it was not my intention to compare or contrast existing and competing economic systems, because I am assuming that we will continue to live and prosper under the capitalistic system. But the opponents of the Kilgore bill have developed an argument that runs in substance: We have great scientific and technical achievements in the United States. The achievements are due entirely to our system of free enterprise under capitalism. Under no other system could they occur. To enact the Kilgore bill would be to place the progress of science outside of the capitalistic system and thus condemn science to asphyxiation.

The argument is invalid all along the line. Scientific progress of a high order at a high velocity occurs under the socialistic system prevailing in the Union of Soviet Socialist Republics. Whether it occurs because of the existence of social-

Digitized by Google

ism or in spite of it I cannot say. What I do say is that the existence of capitalism is not the sole possible prerequisite to scientific progress. Furthermore, the establishment of a Department of Science and Technology of the Government is not a denial of or destruction of capitalism. It would be as logical to say that the establishment of our public-school system was a denial of capitalism and an introduction of socialism into our lives. The fact remains that under any economic system there will exist certain institutions which are merely the means by which the system lives. Just as a Nazi and an American democrat both must have eyes and lungs to live regardless of their differing political ideals, so the state, whether it be capitalistic or socialistic, must have organs called institutions to permit it to live. Capitalistic France and socialistic Russia both had state-owned railway systems; capitalistic America and socialistic Russia both had state-owned post-office systems and educational systems. There is nothing specifically socialistic about a government-controlled Department of Science and Technology. Our state remains capitalistic so long as private ownership of the means of production continues and the private profit principle prevails. It is not essential for capitalism that all ownership be private. Parks, post offices, battleships, and even laboratories and arsenals can be owned by the state under the capitalistic system. This is so obvious it seems to require no setting forth, but some opponents of the Kilgore bill see some advantage to their argument by pretending to believe that the Kilgore bill is socialistic in its objectives.

One of my fellow members was kind enough to remark on my dispassionate judgment on a similar occasion and I began forthwith to annoy myself with irritating questions. How did you get into that state of grace, I asked myself bluntly, but I found an answer. The answer was that I yearned to find the little bit of good that exists in the worst of us just as vehemently as I tried to ferret out the bit of bad that lurks even in the best of us. This should qualify me as an analyst capable of determining trace elements. I might even claim to provide an impartial analysis of the Kilgore bill. If that is your expectation I shall have to disappoint you. For I am a consultant and not an analyst. As a consultant my task is frequently to furnish that which is wanted. And so with the Kilgore bill. I am not so much interested in the Kilgore bill as it is, which would make me an analyst, as I am interested in the Kilgore bill that might be, which makes me a consultant. Expect no impartiality from me—but also expect no gross prejudice.

Whether a given bill or a given aim is desirable for you or for me seems to me to a large extent to depend on what your ideals and my ideals are. We may say it depends on our "philosophies." And reasonable men may arrive at different conclusions from the same set of facts if their philosophies differ, for reason is no absolute. It would be wonderfully fatal to argument if there were some absolute standard of reason by which men could arrive at the best possible conclusion, but men are moved by emotion as easily as by reason and either process convinces them that they have arrived at wisdom. We need remember only that the South less than a century ago considered Negro slavery moral and necessary while the North, by and large, considered it immoral and unnecessary. Back of these contradictory ethical judgments on the morality of the institution of Negro slavery was an economic causative factor—the South was largely controlled by a group whose economic power was based on slave labor, while the controlling group in the North based its economic power on wage labor. There was a conflict of economic interest between these two groups which was translated into the language of ethics. It is always more satisfying to one's self-esteem to say that one's conclusions are ethical or represent the American way than to admit that they represent larger profits to oneself.

I am not trying to read a homily on justice and economic interest.' That is a trifling matter which can best be left to those who are consultants in that field; but I do want to point out that economic interest most certainly colors our judgment. But in coloring our judgment, bluntly, in creating prejudices, it does not always lead us along the most profitable path—and I mean selfishly profitable—any more than mere hunger leads us to select the best foods. The industrialists in Germany who in their hunger for more profits and more power turned to the Nazi Party as their best bet in breaking the power of the unions did in fact get the unions broken as they planned and paid for. They also got an added something which some will live to regret and some will not live to regret, and probably none will live not to regret. For those cynics who say that capitalists and tories never learn and never forget I point with pride and pleasure to the fact that the National Association of Manufacturers had officially come out against

Digitized by Google

a bill to draft labor. That is certainly to their credit, regardless of whether we are ultimately compelled to draft labor. The National Association of Manufacturers has been accused of being reactionary and antilabor (on which point I will pass no judgment), but at least it has learned not to follow the German pattern. Perhaps they realized that they might succeed in crushing labor and live to regret it. So we may smash the Kilgore bill to earth and live to regret it.

I must return for a moment to the editorial in the April issue of Industrial and Engineering Chemistry. It was headlined "Scientific Regimentation." The editor is worried that the passage of the bill would strip the President of some of his powers. (I'll bet dollars to doughnuts he actually doesn't give a hoot whether the President loses any or even a whole lot of his powers, but it does sound important to make the point.) He says of the bill: "To the chemist, to the chemical engineer, to all scientifically trained men and women, it is a potential threat of regimentation and goose-stepping in war and in peace." To which I reply politely but firmly, "Horsefeathers!" The same day that I read the aforementioned editorial I also read (but not for the first time) while standing unpleasantly (but quite unregimented and un-goose-stepping) in the subway that spitting was forbidden in the car under section so-and-so of the sanitary code under pain of $500 fine or a year's imprisonment, or both. I could stand the year's imprisonment or the $500 fine if I became so thoughtless as to spit, but to be punished by both the fine and imprisonment would be too much. That would be—say I say—un-American and perhaps would regiment New Yorkers into becoming a race of un-subway spitters. Let us not take the technical language of a bill too much to heart. Actually we fine spitters $1 or give them a warning—whoever heard of anyone being fined $500 and/or being imprisoned for a year for spitting? But would you have the law state that the maximum punishment is a $1 fine and/or a warning? I give this, of course, not as an argument in favor of the Kilgore bill, but merely as an indication that the legal wording of a bill is the maximum measure of its powers, but not always a true measure of the powers it acquires in practice.

And so the Kilgore bill gives powers which, literally read are literally huge, but no one really believes that the regimenting power and the expropriation power which are specifically limited by the bill to wartime, could be exercised except in the moment of greatest national danger, even greater than the current danger; the courts still exist, the Supreme Court still guards our Constitutional rights, cynics and Roosevelt-baiters to the contrary notwithstanding. I do not believe that anyone honestly thinks that the passage of the Kilgore bill would in fact rob us of our freedom. The powers granted, even for wartime, are permissive and not mandatory, are limited and not limitless.

So, when I am told that the Kilgore bill will spell ruin for my profession I rush in where angels fear to tread. Mind you, so far I haven't said a word about the provisions of the bill itself and I really wish I didn't have to mention the bill at all because the bill has certain features and clauses which are difficult to interpret in terms of reality and which might in fact seem to some people to be laden with the seeds of evil. At least opponents of the bill might point with fear to certain clauses which simply do not frighten me. And yet the bill has certain objectives which I most highly will recommend. Perhaps if Senator Kilgore were here he might reproach me as a poor analyst of his bill—or he might engage me as a consultant to assist him to draft a new bill.

Actually we are told that the Kilgore bill has no chance to pass this session of Congress, in fact, that it has no chance of being brought to a vote. Some of the opponents of the bill have asked that the bill be not discussed at all; to kill it by silence is their plan and hope. For this reason particularly I feel justified in paying more attention to the facts which demand a scientific mobilization bill—not necessarily the present bill—than to the specific terms of this bill, which I shall however discuss in due time. I believe that first things should be first done. I believe that we scientists, we technologists, should first acquire belief in the necessity for a Kilgore bill and then should go out and do a whale of a job in getting the best bill in the world passed by Congress.

Some people object that a director at $12,000 is just another political job at $12,000, implying that a $12,000 bit of patronage is rich gravy, while others assert that $12,000 is chicken feed if you want a first-class director. We can come back to this little difference of opinion later and I think there is a very reasonable and workable compromise.

Now, some people object that an annual appropriation of $200,000,000 is a fantastic sum for scientists to have the spending of each year. Why it is almost precisely the cost of fighting the present war for 1 day; but others object that $200,000,000 per annum is too little to accomplish anything with. May I make

Digitized by Google

the following remark merely as the random thought of a roving scientist?" It is my opinion that if we had had for the past 10 years at $200,000,000 per year a great program of scientific research, directed toward improving the position of the United States in war and peace in the matters of strategic raw materials in which we are not self-supporting, as for instance, rubber, tin, quinine, alumina, tungsten, manganese, mercury, etc., in the matters of aviation, submarine, anti-submarine, tank, antitank, and other military devices, we would at a total cost of 10 days of war expenditures spread over 10 peaceful years have improved our present relative position so that we would have shortened the ultimate duration of the war by at least 10 days, thus returning the entire cost, and we would have lessened the current costs of many materials and devices for a dividend on our investment.

These are, of course, only two features of the bill, one relating to the Administrator's salary and the other to the appropriation necessary. Neither detail I am sure, however it be decided, will regiment us chemists. Of course, I could read the bill to you and comment on it section by section. That might be good exercise for my voice but probably not very enlightening to your minds nor entertaining. For the moment I will say that the purposes of the act are set forth in 12 headings which I will read to you in brief form:

(1) To develop comprehensive programs for the maximum use of science and technology for the national benefit in war and peace;

(2) To mobilize for the prosecution of the war all scientific facilities and personnel;

(3) To facilitate the transition from the tasks of war to peacetime enterprise;

(4) To assemble, coordinate, and encourage publication of all scientific information and data;

(5) To promote the full and speedy introduction of the most advanced and effective techniques in all aspects of the national life;

(6) To aid and encourage and protect the research and enterprise of inventors, scientists, etc., and to make their discoveries more readily available;

(7) To discover and develop substitutes for strategic and critical materials;

(8) To promote interest in scientific and technical education and provide for all qualified persons the means of scientific and technical training and employment;

(9) To provide guidance in scientific and technical matters to the President, Congress, Federal, State, and local governmental agencies and establishments, etc.

(10) To promote the maintenance and expansion of free enterprise by making available to smaller businesses the benefits of scientific advancement;

(11) To standardize when in the public interest, scientific and technical designs, practices, and specifications; and

(12) To establish a national scientific and technical office to coordinate the activities of all the available facilities.

I say it with all the earnestness I can summon that these purposes are a great challenge to the scientists of the country, a glorious opportunity and if effectuated by a properly drafted bill, a grand charter of freedom to science and technology to grow into a magnificent future.

An independent agency of the Federal Government, the Office of Scientific and Technical Mobilization is created.

The structure of the organization is interesting: There is an Administrator appointed by the President at $12,000 per annum and six other members of a National Scientific and Technical Board at $10,000 each. Some of my colleagues object that a really high-class administrator to control the expenditure of the proposed $200,000,000 per annum cannot be had for $12,000 per year. I would suggest that we amend the bill and provide a salary of $100,000 per annum and thus show the movie stars that a scientist heading a vast organization is worth to the people of the United States almost one-fourth as much as the movie stars have been accustomed to get. After all, the people of the United States pay the salaries of both the movie star and the scientist and they would probably be willing to pay a topnotch scientist controlling a vast organization destined to render us supreme in war, economically independent, agriculturally progressive, with employment and profits for all almost one-fourth as much as an actress who gives me a laugh once a year, if I can stand seeing the awful vehicle in which she is usually starred.

If you still believe—as a result of that process of thought which we are pleased to call reason—that it is wise for us to have a whole mess of movie stars who receive—I cannot say "earn"—several hundred thousand dollars a year, for which

Digitized by Google

we are taxed just as truly as if there were a law fixing their salaries, while $12,000 or $20,000 is completely adequate compensation for the greatest of scientists, I will go with you and limit the Administrator's salary to $12,000 or $20,000. After all, a Senator gets $10,000 a year and no one will deny that a Senator is the wisest and most learned of men and that no one should be expected to hope for more than a senatorial stipend by way of a bill which Senators must pass—or at most $12,000. I have no doubt, however, that able men, yes, the ablest men in the country will accept the offer of the Administrator's position because of the great civic honor of heading such an office, the security and the pension which await the competent man in such an office, the esteem of the community. The salary will not represent affluence, but great and worthy citizens will answer their country's call to the administratorship or to the Supreme Court without weighing too carefully their salaries against possible income in private practice. I consider a libel on the profession the declaration that a competent scientist will not be found to head the office at $12,000 a year.

Well, there is this paid board of seven, and a national scientific and technical committee consisting of the above board, one representative from each of such Federal departments as the President may designate, four representatives of the consuming public, three additional scientists or technologists, six additional members representing labor and six additional members representing management, all except the first seven to serve without compensation and to meet regularly not less than once a month.

Naturally, the powers of the Administrator, the board, and the committee are set forth in the bill. To avoid any possibility of misunderstanding I will read section 4 of the act (pp. 8–11):

"POWERS OF THE OFFICE. To effectuate the purposes of this Act, the Office shall be vested with the following powers and duties which it shall exercise and perform under the direction and control of the Administrator:

"(a) To take and keep a census of scientific and technical facilities, requirements, and personnel in the United States and its possessions and to provide archives for all scientific and technical material coming into the possession of the Government or any agency or department thereof.

"(b) To formulate and promote projects and programs for the development and use of scientific and technical facilities and personnel and, when necessary, to initiate and carry out such projects.

"(c) To foster and develop scientific and technical methods, to promote their application in the national welfare, either within the Office or by other auspices, public or private, and to promote and provide training and participation in science and in its application.

"(d) To ascertain and assess scientific and technical developments in relation to, and to study their impact upon, the national welfare, or any particular category thereof.

"(e) To solicit and to receive aid and support from any source for the advancement of scientific and technical methods.

"(f) To coordinate the scientific and technical data, methods, and facilities of, or available to, all agencies and departments of the Federal Government.

"(g) To foster international cooperation in scientific discovery and the application thereof; to acquire information with respect thereto from other countries and their nationals; to exchange scientific and technical personnel and information with such countries; and to engage in other suitable forms of international collaboration relating to science and technology.

"(h) To make available, upon request, to the President, to the Congress, and to other persons or establishments (upon such conditions as the Administrator shall prescribe), technical guidance and assistance and any record or other data necessary therefor.

"(i) To review specifications, standards, and designs of military and civilian products and services and their methods of production and supply and to recommend suitable simplifications and changes therein.

"(j) To finance by loan, grant, exchange, purchase, or otherwise the operations or functions, or any of them, authorized by this Act, and for the same purposes, to make or acquire any contract, guaranty, indemnity, stipulation, lease, or other instrument, to acquire, improve, and alter real and personal property, and to enter into any other transaction necessary or appropriate for the performance of its duties or powers.

"(k) To acquire patents and patent rights, and to authorize the use thereof, subject to the provisions of section 7 of this Act, and to authorize the use or other disposition of any other property belonging to, or controlled by, the Office,

Digitized by Google

upon such terms and conditions and for such compensation as the Administrator shall determine, which compensation shall be payable to the Office.

"(l) To establish a system of merit awards to be granted to any agency, establishment, or person making any outstanding scientific or technical contribution to the national defense or the general welfare.

"(m) To make, amend, and rescind appropriate rules and regulations to carry out the purposes of this Act and all the powers and duties vested in the Office, which rules and regulations shall have the force and effect of law.

"(n) To avail the Office of the information, services, facilities, officers, and employees of any Federal establishment in carrying out the purposes and provisions of this Act.

"(o) To conduct such research and investigation touching upon the use and development of scientific and technical facilities and personnel as the Office may deem necessary and appropriate to carry out the purposes of this Act."

These powers are, of course, as read, extensive indeed, but they must be read in connection with the purposes of the bill. Take item (j); this refers to financing the projects. Now, obviously, if there are purposes and objectives of this independent office set-up to be carried out, we must implement the authority of the Administrator so that these purposes and objectives can be carried out. We cannot expect the Administrator to go before Congress to get a specific appropriation for each project. If, for instance, the Administrator decided that a project on the hydrolysis of straw is to be carried out, he must finance the cost in one way or another, or if the project is already under way under private auspices but cannot proceed because of lack of funds he must be able "to make or acquire any contract, guaranty, indemnity, stipulation, lease, or other instrument, to acquire, improve, and alter real and personal property, and to enter into any other transaction necessary or appropriate for the performance of its duties or powers." Must we scuttle the Office before it starts its journey by denying it the right to acquire, improve, and alter real and personal property as will be necessary if it takes over a pilot plant on the theory that such powers will enable the office to purchase the Empire State Building and alter it into bowling alleys with tennis courts on the topmost roof! Those who claim that the powers are dictatorial are invoking fears which they cannot possibly share and pretending to see a grant of powers which they know are not being granted. The powers granted must be in accord with the stated purposes of the legislation and cannot be read out of their context. These powers are permissive, not mandatory. No acquisition of property is made compulsory—the owners may do so if they wish and certainly they will not do so unless they consider it to their advantage.

In connection with the mobilization of personnel (section 5), there is a heading relating to deferments under the Selective Training and Service Act. I say unqualifiedly that I should far prefer to have deferments of scientific personnel under this Office than under the local draft boards. As for personnel outside of the draft, the Office, subject to direction by the Chairman of the War Manpower Commission, is authorized to provide the rules. If the Chairman of the War Manpower Commission wants the aid of the Office, he should be able to get it; if he does not need such aid or does not want it, the Office has no powers. I have no fear of regimentation from this section, for the Office has power only when requested to exercise certain powers already possessed by another establishment.

We then have a Mobilization of Facilities (sec. 6, (a) (1), pp. 13–14, line 10).

"(a) (1). During the existence of a state of war, whenever the Administrator determines, subject to review by the President, that (1) the use of any scientific or technical facility, or of any license, easement, privilege, or other right therein, is needed for the defense of the United States or the prosecution of the war; (2) such need is immediate and impending and such as will not admit of delay or adequate fulfillment by resort to any other source of supply; and (3) all other means of obtaining the use of such facility or of any right therein, upon fair and reasonable terms, for the defense of the United States or the prosecution of the war have been exhausted, he is authorized to requisition such facility and any rights therein and to dispose of the same in such manner, not inconsistent with this Act, as he may determine to be necessary for the defense of the United States or the prosecution of the war upon the payment of fair and just compensation for such property to be determined in the same manner as provided in Public Law Numbered 274, Seventy-seventh Congress, as amended, except that the Administrator, subject to review by the President, shall make all determinations in the first instance, respecting fair value of such

Digitized by Google

facility and right: *Provided*, That the requisitioning power herein granted shall not extend to any patent itself but shall be confined to licenses or any other right therein respecting user, together with the right to grant sublicenses."

Again I see this as a necessary power and one which should be granted.

Subsection (2) relates to the return of requisitioned facilities and (3) relates to reports; (*b*) relates to military and essential civilian investigations while (*c*) relates to representation before the War Production Board by the Administrator on behalf of other agencies. This is a power which gives no real added power to the Administrator and involves no vital principle.

Section 7 relates to patents. Let us be realistic. The bill declares that where Government money or facilities are invested in research, the resultant patents are vested in the Office. Surely, the Government is entitled to such ownership provided any contributions by others are properly compensated for as provided. The Government through this Office may issue nonexclusive licenses to use such patents at uniform charges under nonmonopolistic conditions. This, in my opinion, in no way affects our patent laws. Every corporation protects its patent interests; the Government is entitled to equal equitable protection.

This completes the consideration of all essential features of the bill. The bill, in my opinion, contains no provision which is detrimental to the national or individual welfare and it provides means for the accomplishment of necessary objectives.

In considering the Kilgore bill for which I have given this atmospheric description I have chosen primarily to consider its effects on and consequences for 132,000,000 and not primarily its impact on the several hundreds or several thousands or perhaps several hundreds of thousands of people who exist and thrive as consultants, scientists, and technologists.

RÉSUMÉ

I shall now summarize what I have had to say. The Kilgore bill marks an important milestone in the recognition of the place science and technology occupy in modern civilization and in the structure of the state. I believe that it is an important step toward the ultimate creation of a Department of Science and Technology whose administrative head will have Cabinet rank.

I recognize that in taking this important, this momentous, step forward, men of good will may differ about details of procedure, organization, and powers to be granted. I realize that there are vested interests (and by vested interests I mean not necessarily predatory interests but merely already acquired interests) which rush intuitively into an attitude of self-defense whenever the position under the law is to be altered. I realize that many large corporations enjoying virtual monopolies either through vast financial powers or through patent pools or patent structures will resist a change in the set-up. I do not consider this as a sign of inherent viciousness on their part. We have justified the making of profits both by law and morals, and the corporate attitude springs from this legal and ethical justification. However, we are growing into a more democratic belief that national welfare is best served by establishing the greatest good for the greatest number. While we have not yet come to the point where we will deliberately destroy by law the great industrial agencies, and I trust we never will, I do believe that we have concluded that it is just and moral in the national interest to control and regulate our great industries and to provide for the utilization of the national scientific and technological resources of the Nation for the benefit of the Nation. I believe unqualifiedly that the establishment of the Bureau of Standards, the laboratories of the Department of Agriculture, the regional laboratories, the Tennessee Valley Authority, the Navy Department, the Bureau of Mines, and a hundred others have all been steps in one direction, the logical terminus of which is that contemplated by the Kilgore bill and I believe that the time for integration of all these activities has arrived.

I believe further that the law and the devices by which the Nation lives and thrives are subject to improvement and evolution. We do not live for the law; the law is established to further our convenience. I believe that our patent system is due for an overhauling much more thorough than that contemplated by the Kilgore bill. The Kilgore bill refers only to the patents which arise from the operation of governmental agencies or from the use of governmental facilities, personnel, or money. Every corporation provides for the ownership, use, and disposition of the patents arising from the use of its facilities, personnel, or money, and our Government should do no less for the inventions arising from the

Digitized by Google

expenditure of the people's money. In addition to providing for vesting title in these patents in the appropriate Government agency, specifical provision is made to compensate anyone who is deprived of any property right under the workings of this law. This is equitable. If the details of the section dealing with patents require amendment, I suggest that we, the large corporations, and the patent attorneys work with the Kilgore committee on its successors to bring about meritorious modification of the proposed law. This will be more effective, more useful, more beneficial than merely resisting the passage of the law blindly. New conditions require new laws. Let us aid in making these laws as just and effective as possible.

Finally I find no regimentation of scientists provided for in the bill. The establishment of the Bureau of Standards, while it provided control over the technologists employed, did not regiment the scientists. Nor will the establishment of the Office of Scientific Mobilization regiment us. I have no fear that the control of personnel will be more intense than the act specifically states, namely, the control of occupational deferment in time of war. Wars, I trust, do not last forever, and even in wartime I would a hundred times, nay, a million times, prefer to put occupational deferments in the hands of such an office than to leave them in the hands of local draft boards. In the matter of mobilization of facilities I believe that only one who is easily scared by the bogeyman will be genuinely frightened by the provisions of the bill. Mind you, during a state of war and then only, the Administrator, subject to review by the President, may determine that a certain facility is needed for the defense of the Nation or to prosecute the war, that the need is immediate, and that all other means to obtain the facility upon fair and reasonable terms have been exhausted; then—and then only—he may requisition said facility upon payment of fair and just compensation, but no patent may be seized, and the facility is to be returned when the war is over. I believe that this procedure can be carried out at present when needed even without any Kilgore bill, but the procedure should be regularized as the bill provides. If the bill did not have this provision, I would be in favor of inserting it.

Finally, I would add a word about the alleged danger of governmental competition with the activities of our own members. It is an old cry. The financial danger to our activities has never arisen from the operation of Government laboratories, but only from the competition of unqualified inadequately skilled pretenders to the name and status of consultants and from the operations of university laboratories making substandard charges. But there has not been any claim that the governmental laboratories have poached on our preserves by either of these two methods, the carrying out of consultation work in competition with us by unqualified persons or at substandard charges. Only work of national importance is to be carried out by this organization of the Nation. A huge field remains to us and just as the creation of every Federal laboratory has led to more work and opportunities for men and organizations not part of the Federal scheme, so I have no doubt that this Federal activity will mean more widespread opportunities of service for all chemists, both within and without the Federal structure.

EXHIBIT No. 21

NEW YORK, N. Y.,
May 27, 1943.

Senator HARLEY M. KILGORE,
United States Senate,
Washington, D. C.

DEAR SENATOR KILGORE: I have your letter of May 13 requesting permission to use the speech made by me on April 26 or parts of it to enlist support for S. 702. You have my permission to do so and in addition I have secured permission of the Council of the Association of Consulting Chemists and Chemical Engineers for such use. The council however made it clear that my address is not to be assumed to represent the official viewpoint and stand of the association. In this connection it may be of interest to you to know that a mail vote was had of the opinions of the membership on the desirability of the objectives sought by S. 702, the desirablity of the present form of the bill, and the desirablity of extending the organization to be created into peacetime. The vote on the desirability of the objectives envisaged by the bill was approximately even. I consider this somewhat of a triumph (though you may not consider it so) as the attacks on the bill by the old-school type of industrially successful chemists have been very intense and venomous. The vote went very heavily against the

Digitized by Google

present form of the bill. This may be ascribed to the fact that the average citizen (technologist or otherwise) does not realize that the actual form of a bill is largely determined in a special language by skilled bill drafters who seek to avaoid common pitfalls in the phraseology of a bill and consequently arrive at a severe and terrifying formalism. The vote went also against extending the existence of the office into peacetime although the vote was not so heavy against that aspect of the bill.

The version of the speech which I sent you was prepared in advance of the delivery. In the actual delivery I made certain changes by means of pencilled notations and the revised form is enclosed herewith. It does not differ in essence from the copy previously sent you but it does contain some additional argument and I suggest that you destroy the copy you have on hand and replace it by the present copy.

I shall probably be in Washington between June 5 and 10 and I shall take the liberty of phoning your office to determine whether I can have a few moments of your time to discuss the bill.

Yours very truly,

ALBERT P. SACHS.

EXHIBIT No. 22

FRANKLIN TECHNICAL INSTITUTE,
Boston, Mass., July 20, 1943.

Senator H. M. KILGORE
United States Senate Office Building,
Washington, D. C.

MY DEAR SENATOR KILGORE: Since writing you on July 5 I have carefully gone over the Senate bill No. 702 and also parts 1 and 2 of the hearings.

I am very strong for States rights. I believe that this bill could in no way interfere with such privileges and should very definitely improve existing conditions. I am strongly in favor of it and hope that it will be passed. It hardly seems reasonable that some companies would make the agreements they have, which really in the end are not to their advantage.

Thanking you for bringing this to my attention, I am,

Sincerely yours,

B. K. THOROGOOD.

EXHIBIT No. 23

WESTVACO CHLORINE PRODUCTS CORPORATION,
New York, N. Y., June 7, 1943.

The Honorable HARLEY M. KILGORE,
Senate Office Building, Washington, D. C.

DEAR SENATOR KILGORE: I had the pleasure of hearing you speak recently before the New York meeting of the American Institute of Chemical Engineers with reference to your bill on technological mobilization, which is before the Senate Military Affairs Committee at the present time. Earlier you had been good enough to send me copies of the hearings on a parallel bill which was before the last Congress. I have taken the time necessary to read the record of these hearings and to generally familiarize myself with the subject matter and the possible implications of your current bill.

Let me say, as a preamble, that I am a chemical engineer by profession and have been engaged in chemical-engineering activities in the chemical industry for some 30 years, during which time I have had issued to me a reasonable number of patents on chemical subjects. Among my present duties is included the responsibility for directing the research and development activities of a large chemical company, in which activities substantial six-figure dollars are expended each year.

There can be no question but that "the full development and application of the Nation's scientific and technical resources are necessary for the effective prosecution of the war and for peacetime progress and prosperity" (sec. I, S. 702), but it is not believed that the impediments to proper technological progress, which your bill is intended to remove, actually exist.

As regards wartime technical activities, it appears to me—based on some very active and reasonably intimate experience—that the functioning of the

Digitized by Google

National Academy of Sciences in making available for consideration of any particular problem competent technical opinions on the most unselfish and intimate sort of a basis, has gone far to assure us that no important technical advance known to private industry is withheld from use in connection with the war effort. I know of no instance where competent men have refused to accept membership on appropriate National Academy of Sciences committees or where, after having accepted such membership, they did not freely and fully pass on information at their disposal. Furthermore, outside and apart from Academy endeavors, there is a constant informal cooperation among those engaged in the production or the development of articles needed for the war to the end that the information which each possesses is made available to all properly interested parties.

As regards technological progress in peacetime, I believe that there is no substitute for a proper competitive urge and for individual initiative in advancing our knowledge in technical fields. Experience leads me to feel that this comment holds true as definitely in pure research endeavors as it does in manufacturing and distribution.

I am convinced that the striving of many competent industrial managers for a desired goal is far more likely to result in steady technological advances than is the application of the God-like powers assigned to the Administrator provided for in your bill.

I do not find in the record of the hearings held on the companion bill during the last Gongress, any sound indication that monopolistic practices could be held responsible for having restrained technological progress. Frankly, it seemed to me that the testimony intended to develop such a case was confused, biased, and did not present any facts which bore out the contentions made.

Based upon my study of the subject—which I am willing to admit is not complete, but certainly is far more than a casual one—I am prepared to argue that passage of your bill will accomplish no desirable and useful purpose at this time. I regret that I cannot see eye to eye with you with reference to this matter, but believe that you desire to have a frank expression of opinion from those who have had occasion to study this general subject.

Very truly yours,

WESTVACO CHLORINE PRODUCTS CORPORATION,
M. Y. SEATON, *Executive Vice President.*

EXHIBIT No. 24

Mr. M. Y. SEATON,
Executive Vice President, Westvaco Chlorine Products Corporation,
New York, N. Y.

DEAR MR. SEATON: I have been very interested in your letter of recent date which I have held until there was sufficient time to give an answer which your commentary on the science mobilization bill requires.

I was prompted to introduce this bill from my work with the Truman committee in its investigations of the war program, as well as from my study of the findings of a number of other congressional committees, notably the Patents Committee. I will agree that there have been prodigious advances by industry in the war program, if measured by pre-war standards, but these committee findings point up the fact that this is not the full story. Certain factors in the structure of American economy have held back scientists and technological developments to a mere fraction of their actual potentialities.

These major impediments reside in the persistence of the pre-war policy of curtailment of production to maintain high prices and market control, the abuses in the patent system by certain monopolistic groups, the failure to utilize small plants, and the lack of centralized planning of the production program. Some of the Truman findings have been highlighted in the press and are undoubtedly familiar to you.

I would agree that the volumes of hearings on S. 702 now in print do not present a full delineation of the monopolistic practices prevalent in some quarters of industry. However, this premise of the bill is based largely on the findings of the Patents Committee which were introduced into our record by reference in testimony presented by Senator Bone on June 4. His committee conducted hearings during the last session of Congress, accumulating nine volumes which will appear in condensed form in the S. 702 record. I am enclosing two excerpts from the June 4 testimony which will interest you, and when the full text becomes

Digitized by Google

available, I will see that you receive copies. Senator Bone's citation of the monopoly control of cemented tungsten carbide (further testimony by Senator Bone, p. 2) is only one of many examples of this type of monopolistic practice that these investigations have brought to light.

In this same testimony Senator Bone's summary is very pertinent to this discussion:

"Mr. Chairman, I want to say that the control achieved through the cartel system is as near feudalism as anything could be devised in these modern times of ours. It was feudalism in a new dress. The control was airtight. Cartel members want stability and monopoly. The thing is essentially a negation of 'capitalism.' It will spell the end of classic and orthodox capitalism if it continues because, as I see capitalism, it is a system of free enterprise in which there is a free play of competitive forces. These gentlemen of the cartel world do not want 'capitalism.' They want 'monopoly' and it is business feudalism. They want one group to control through a vertical and horizontal trust, and that, sir, is not 'capitalism' * * * Free competition is passing away and we are, oddly enough at the moment when we hear much defense of the capitalist system, witnessing the commencement of its extinguishment. The blackout is coming about because stanch defenders of capitalism further the cause of the very creature they are bringing into being, the Frankenstein of monopoly which in itself invites the utter destruction of the capitalism. That is a fairly accurate portrayal of what is happening * * *."

Monopolies are still patterning their economic behavior after the pre-war idea of low production and high prices, and are resisting the competition of the small producers whose output would expand production to fit the needs of the war, lest it endanger their post-war controls of the markets. Their influence has been so strong that the Smaller War Plants Corporation, established under the Smaller War Plants Act in the summer of 1942 after pressure by the House and Senate Small Business Committees, has been a conspicuous failure. After 6 months of work, only $2,000,000 of the Small War Plants Corporation's capital of $150,000,000 had been loaned to small business, and only 234 out of 2,200 distressed companies who had provided a list of their facilities had received contracts. This was during a period when production in this country should have been at the peak.

Your observation on the National Academy of Sciences leads me to cite the Hixon-Miller experience, which you probably read in volume II, testimony on S. 2721, predecessor of the present bill. Ralph Miller, coinventor of the Hixon-Miller process for the production of aluminum from clay, appeared before the subcommittee on November 25 of last year. In his testimony Mr. Miller stated they started their attempts to introduce the new process early in 1941. He described their unsatisfactory experiences with the National Academy of Sciences committee, which rejected their process and said they later learned that Dr. Francis C. Frary, of the Aluminum Co. of America, and Mr. R. S. Sherwin, of the Reynolds Metal Corporation, were members of the National Academy of Sciences committee. Mr. Miller pointed out, "Some of the criticism (of the committee) was valid, some indicated the committee was not aware of the advances that have been made in materials of construction, and some indicated that the committee was making almost foolish objections * * *." From January 1941 until the November hearing they had made vain attempts to advance their process, trying unsuccessfully to confer with the National Academy of Sciences' committee members in an effort to obtain some constructive criticism. On contacting the Subcommittee on War Mobilization, Mr. Miller was advised to contact the Bureau of Mines. As a result of discussions there, laboratory work is now in progress there on the process. Mr. Miller and Mr. John J. Foley, treasurer and general manager of the Chemical Foundation, who appeared at the same hearing, deplored the fact that representatives of competing industries are members of the National Academy of Sciences. Mr. Foley stated:

"The perfect example is that in one instance (Mr.) Sherwin as a member of the subcommittee of the National Academy of Sciences is passing on the process we submitted to him and recommending that no pilot plant work be done on it. On the other hand, he is examining it as an executive of Reynolds Metal Co. and telling us that we are wrong on our costs. He can't tell us where we are wrong on them because we have not done pilot-plant work. In other words, you are asking the men who are actually engaged in the business to pass upon processes which may compete with their own processes * * *."

Again, there are countless examples of this repetition of an improper utilization of scientific and technical resources, facilities, and personnel in the war program.

Digitized by Google

The burden of the evidence that has come to my attention substantiates my conviction that an office of scientific and technical mobilization, as proposed by S. 702, would be a long step in effecting a more efficient prosecution of the war and in working toward post-war security.

Very sincerely yours,

H. M. KILGORE,
United States Senator.

EXHIBIT NO. 25

ABBOT A. HANKS, INC.,
San Francisco, Calif., June 4, 1943.

Hon. EDWIN C. JOHNSON,
Senator, Senate Office Building, Washington, D. C.

Re Kilgore bill, S. 702.

DEAR SIR: It is my wish that this letter be placed on record as a protest against Senate bill, S. 702.

This firm has been in technical scientific work since 1866 (77 years of continual business) and is alarmed over the breath-taking project as covered in this Kilgore bill. I cannot recall anything so astounding and discouraging to individual effort as is set down in the provisions of this bill. It would seem that the fundamental principles of the Government for protection, individuality, and resourcefulness are absolutely ignored, not only for this wartime period but also after peace is declared.

It has always been our endeavor to cooperate with our Government in all technical or scientific matters and we will hope to continue to do so, but we do not care for the tendency of recent years toward bureaucracy and the wide unnecessary expenditure of the funds of the people for such purposes.

Very truly yours,

ABBOT A. HANKS, INC.,
By HERBERT D. IMRIE,
President.

EXHIBIT NO. 26

JUNE 15, 1943.

MR. HERBERT D. IMRIE,
President, Abbot A. Hanks, Inc., San Francisco, Calif.

DEAR MR. IMRIE: I have discussed your letter of June 4 with Senator Kilgore, the author of this measure, and he informs me that it was one of his endeavors in introducing this bill to provide a method for more effectively assisting and awarding the individual inventor by making provision for possible Government assistance in the development of his invention. It may be that the legal language in which so much legislation is now couched has obscured this very simple objective he had in mind.

He would be glad, therefore, if you could tell him what you regard as the objectionable language and what provision you would regard as desirable to encourage invention and assist individual inventors who are now financially unable to promote their own developments.

As you request, your letter will be recorded as a protest against this bill.

Very sincerely,

EDWIN C. JOHNSON,
United States Senator.

EXHIBIT NO. 27

NEW YORK CITY, *May 12, 1943.*

Hon. H. M. KILGORE,
United States Senator for West Virginia,
Senate Office Building, Washington, D. C.

DEAR SENATOR: Referring to your kind favor dated April 23, I have been studying the science mobilization bill S. 702 and reading or hearing views for and against it. Since you ask for my comments and recommendations, I must say that, in my opinion, it is contrary to the best interests of our country, of science, of scientists, and of industry. I trust that it will be withdrawn or defeated.

Digitized by Google

While I do not question the high motives or ideals actuating those who support the bill, it places great power in the hands of a few appointees and subappointees, and this power might readily be misused, human nature and political considerations being what they actually are. This is the type of procedure which has brought Italy and Germany to what they now are. We must consider not only the wise use of power, but also the possibility, even probability, of its abuse. Governmental, private, and personal scientific agencies are now doing great and coordinated service for our Government in helping win this war, and I think that the existing agencies should be supported and helped, rather than merged into an over-all agency of such size and complexity as to be impracticable.

On inquiry, I find that the resolution of the American Association for the Advancement of Science, which you quote in your letter in favor of executive domination of science and scientists, was passed about 9 years ago in protest against an Executive order reducing by 50 percent the funds available for the National Bureau of Standards, the United States Geological Survey, and other bureaus of the Government. Please advise me if I am incorrectly informed.

In a brief note like this there is no room to discuss the question of small business, so-called. I may say, however, that there are many kinds of business that small (in a financial sense) men can enter only as stockholders, directly or through life insurance or other investing companies, or as employees, for the simple reason that large capital is essential to build and to operate plants—e. g., sugar refining, making iron and steel. Private consultants, like myself, are independent agents offering our services to help those who cannot afford research laboratories of their own.

I respectfully ask that this letter be included in the report of your next hearing on your bill S. 702.

Sincerely,

JEROME ALEXANDER.

EXHIBIT No. 28

JUNE 16, 1943.

Mr. JEROME ALEXANDER,
New York City.

DEAR MR. ALEXANDER: This will express my warm appreciation for your recent letter concerning the science mobilization bill, S. 702.

I regret your disapproval of the bill since I believe you have misinterpreted its intent. This bill does not intend that existing agencies be merged into one large group but rather that the proposed office serve as a planning and integrating group. This will facilitate rather than impede the work of the existing groups and would aid in further decentralizing their work.

While I do not know the full background of the A. A. A. S. resolution of 1934, I believe the statement it makes is very pertinent to our present condition. In this connection, I should like to report that a great many of the country's leading scientists have indicated their support in response to my letter of April 23. Since I am interested in all sides of the question I shall be glad to have your letter printed along with others.

I am convinced that only by the careful exploration of the various aspects of this bill by competent scientists can such legislation be made adequate and therefore would appreciate your continuing interest and cooperation.

Sincerely,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 29

INTERNATIONAL BROTHERHOOD OF ELECTRICAL WORKERS.
Washington, D. C., June 16, 1943.

Hon. HARLEY M. KILGORE,
Senator, United States Senate Building,
Washington, D. C.

DEAR SENATOR KILGORE: Regarding H. R. 2100, a bill intended to mobilize the scientific and technical resources of the Nation, and to establish an Office of Scientific and Technical Mobilization, our organization and I personally are very much interested in this bill, and hope it shall have a successful conclusion.

Digitized by Google

As president of an organization with members in excess of 250,000 who are dependent mostly upon smaller businessmen and the farmer, we realize the necessity of protection to these classes of employers. We also have employers who are in the manufacturing business on a small scale. These employers are somewhat subservient to the larger manufacturers, who can withhold their raw materials from these small businessmen if they will to do so.

For your information, I am enclosing a letter written by a small manufacturer to Col. Robert W. Johnson, vice chairman of the War Production Ordnance Department, Washington, D. C. In this letter you will note that this small plant is competent and has in the past turned out manufactured goods necessary to prosecute our war effort.

In this particular plant men and women have been laid off due to the fact that raw materials could not be secured, while the larger steel companies still produced this manufactured article which could be diverted to the smaller plants.

We do not want to burden you with the lengthy statement, but this is just one of many similar situations in the United States.

Again hoping you have success with bill H. R. 2100, I remain,

Yours truly,

E. J. BROWN. *International President.*

EXHIBIT No. 30

JUNE 25, 1943.

Mr. E. J. BROWN,
International President, International Brotherhood of Electrical Workers, Washington. D. C.

DEAR MR. BROWN: I am keenly interested in your letter of June 16 in support of S. 702, the science mobilization bill, and H. R. 2100, the companion bill in the House.

It was my intention in introducing the bill to aid small business to the fullest extent. The proposed Office of Scientific and Technical Mobilization would aid this group, I believe, similarly to the way private industry is now aided by private laboratories. Testimony presented to the subcommittee currently studying S. 702 indicates that shortages of many vital materials, production delays, cutbacks, and admitted errors in the progress of the war have been largely due, in many cases, to the lack of efficient planning, and an improper utilization of our scientific and technical resources and personnel. It is my hope to see small business given the fullest opportunity to contribute to the winning of the war and in coping with post-war problems.

I would very much like to see the letter from the small manufacturer to Col. Robert W. Johnson, vice chairman of the War Production Ordnance Department, which apparently was not enclosed with your letter.

I am warmly appreciative of the support of the brotherhood in working for the enactment of S. 702, and am taking the liberty of printing your letter in the record.

If you would care to testify personally before the subcommittee, I should be very glad to arrange it.

I invite your continuing support of the proposed legislation, which is vital to small business as well as to the public interest in general.

Very sincerely,

H. M. KILGORE, *United States Senator.*

EXHIBIT No. 31

CHAMBER OF COMMERCE,
Petoskey, Mich., April 30, 1943.

Hon. H. M. KILGORE,
United States Senator, District of West Virginia, Washington, D. C.

MY DEAR SIR: We are in receipt of the mimeographed copy of the information given by Finley Tynes, secretary of the Chamber of Commerce of Staunton and Augusta Counties of your home State, before the Military Affairs Committee on the matter of science mobilization.

The opinions expressed by Mr. Tynes are likewise those of our organization and we are so advising him.

Digitized by Google

During the past 6 years we have been experiencing the development of a new cash crop which will vitally affect the lean agricultural advantages of this region, devoted for the past 60 years to the summer resort business. The item has just recently been recognized by the Navy Department as a matter of war necessity as well as a post-war need. Further recognition and assistance on the part of the Department of Agriculture and financial agencies will be needed.

Of course, those who have fostered the program can dispose of their patents, methods, etc., to larger companies, who in turn will take it off the market or move the seat of operations to some field far distant from the one for which it was originally planned, * * * and the efforts of organizations such as the chamber of commerce lost as far as benefiting their communties are concerned.

We trust that as chairman of the committee charged with investigating and recommending such development, that every effort will be made to create a research program closely allied with the smaller communties.

Very truly yours,

WILSON J. MCDONALD, *Secretary.*

EXHIBIT No. 32

UNIVERSITY OF PENNSYLVANIA,
Philadelphia, May 5, 1943.

The Honorable H. M. KILGORE,
The United States Senate, Washington, D. C.

DEAR SIR: Thank you for sending me a copy of the science mobilization bill and for asking my comment about it. Naturally all scientific workers in the United States are interested, both in the use that can be made of science in winning the war and the preservation of science and scientific effort. Scientific progress is accomplished by scientific workers and there is not an inexhaustible store of such workers. What seems to me most important is to preserve the workers we have and not to let them be used carelessly in the war effort. Everyone who understands the history of science knows that often discoveries which appear to have no practical benefit often in very short time become of great significance. We have had an example recently in the case of vitamin K. When it was discovered just a few years ago it seemed to be a vitamin only of importance for some kinds of birds. Now the vitamin is widely used in clinical medicine.

During the past few months, in the course of preparation of a book, I have found it necessary to follow scientific progress in Axis countries. This is being done through the study of microfilm copies of Axis publications obtained presumably through neutral countries. I am impressed with the fact that pure science seems to have made real progress in these countries, even as late as 1942. Here in America there has been little willingness on the part of the draft boards to exempt scientific workers. Sometimes these workers find a useful place in the war effort; in other instances their scientific training is not made use of at all. If your bill can make it possible for scientific workers to continue their efforts, even though these efforts may not be of immediately practical benefit, I should be very happy. At the present time the science of physiology, which is my specialty, has been rather seriously disrupted and retarded by the war effort. I am not sure that this is wise.

I hope that you will not misconstrue my motives in writing this letter. Twenty-six years ago I left my scientific work to enlist in the air service and I served 2 years in this branch of the Army. The experience was valuable, and, of course, interesting, but not very profitable scientifically.

Yours very truly,

L. V. HEILBRUNN,
Associate Professor of Zoology.

Stanford University, Calif., May 11, 1943.

Senator H. M. KILGORE,
Committee on Military Affairs, United States Senate,
Senate Office Building, Washington, D. C.

DEAR SENATOR KILGORE: I am very anxious to go on record as favoring bill S. 702. It seems to me it is high time for the Government to take an interest in the progress of science. However, I am not in favor of section 4 (1) which considers a system of merit awards. I cannot see why the Federal Government should handle matters of this sort.

Very truly yours,

PAUL R. FARNSWORTH,
Acting Executive Head.

EXHIBIT No. 35

HARVARD UNIVERSITY,
Cambridge, Mass., April 30, 1943.

Hon. H. M. KILGORE,
United States Senate, Washington, D. C.

MY DEAR SENATOR KILGORE: I am heartily in accord with your science mobilization bill (S. 702, H. R. 2100) and trust that it will receive favorable action.

My only question is whether there are safeguards for existing agencies such as the Office of Scientific Research and Development and the National Defense Research Committee. I hope there will be no new competing bodies that will obscure and duplicate function. After the Civil War we were left with the National Academy; after the World War we were left with the National Research Council. The present war has produced the Office of Scientific Research and Development and the National Defense Research Committee. To create a yet new and separate body would seem wasteful indeed; therefore, I trust that the acceptance of your bill will clearly indicate the relationship between the proposed Office of Scientific and Technical Mobilization and existing agencies.

With my congratulations for your splendid proposal, I am

Sincerely yours,

GORDON W. ALLPORT,
Chairman, Department of Psychology.

EXHIBIT No. 36

MAY 28, 1943.

Mr. GORDON W. ALLPORT,
Chairman, Department of Psychology,
Harvard University, Cambridge, Mass.

MY DEAR MR. ALLPORT: Thank you for your good letter of April 30 on S. 702.

Answering your question about Office of Scientific Research and Development and National Defense Research Committee, the only agency transferred, as the bill is now written, is the National Roster of Scientific and Specialized Personnel, now a part of the War Manpower Commission. The present work of Office of Scientific Research and Development and National Defense Research Committee would be coordinated with the work of other agencies, but their activities would continue and be assisted where possible, not disturbed.

Digitized by Google

I hope you will give this measure your active support in order to insure its early passage.

Very sincerely yours,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 37

CLARK UNIVERSITY,
Worcester, Mass., April 27, 1943.

Senator H. M. KILGORE,
Committee on Military Affairs, United States Senate,
Washington, D. C.

DEAR SENATOR KILGORE: This is to acknowledge your letter of April 23 and its enclosures concerning the science mobilization bill.

With the purposes of the proposed bill I am, as a scientist intensely interested in furthering the war effort, very much in agreement. The general plan of organization of the proposed office seems satisfactory although I believe that two additional requirements or provisions should be included. These are: (1) That the administrator should be a bona fide scientist of high repute, and (2) that the board or its committee be authorized to appoint advisory subcommittees of experts to assist and advise them in their deliberations. The requirement of a scientist as administrator seems to me to be absolutely essential since it is precisely with scientific matters that he is to deal. The need of appropriate subcommittees is obvious in view of the extraordinary degree of specialization in science.

The one large defect of the bill appears to me to be the lack of any provision for rapidly effective liaison between the office and the armed forces. Only in section 8 (b) is a joint committee authorized and this is apparently to be concerned only with the question of secrecy and restriction of information. Having had some experience in just this field, let me cite an instance as an example of the point. Last fall our laboratory completed certain phases of an investigation of the fatigue of airplane pilots under a project sponsored by the Office of Emergency Management, the Civil Aeronautics Administration, and the United States Navy. We gathered objective scientific evidence indicating that we had discovered a specific substance, that could be taken by mouth, which could increase the efficiency of pilots by some 20 to 30 percent and which raised their ability to respond to emergencies by some 50 percent. This material acted not as a momentary drug stimulant, but was effective continuously and with no adverse side effects whatsoever. Tests were performed with United States Army pilots. Reports were submitted to various interested agencies and specifically there was forwarded to the Office of the Air Surgeon General a proposal to initiate certain field studies. This proposal still gathers dust in Washington, despite the fact that the added efficiency that might be obtained should be equivalent to adding 20 to 30 percent to our air personnel and by its especial advantage in emergencies might materially aid certain combat maneuvers, reducing landing accidents, etc. In the inerim the Royal Air Force has taken the matter up and will repeat our investigation in the field. I am not citing this to plead for this particular research, but to indicate to you that unless scientific findings are acted upon by the armed forces or other branches of the war effort they might as well not be done at all.

What is requisite, it seems to me, is a committee like that described in section 8 (b) (and a similar liaison committee with appropriate branches of industry and agriculture), whose duty it shall be to report on the usefulness for the war effort of any scientific discovery presented to it by the board. Furthermore, it should be provided that this report be made speedily, that it include specific criticism and suggestion. I should like to have it mandatory that such a liaison committee be permitted to refrain from reporting on any single project for no longer than 3 months, except by special permission of the board.

Another defect of the bill again appears to me to involve this matter of coordination with the armed forces. The latter have their own research institutions. The findings of such institutions should, it seems to me, be made available to the board so that it may offer suggestion, criticism, and advice. An Army laboratory, for example, might develop an antiaircraft device to a certain point. The board might have information of a correlated finding not especially useful in itself but

Digitized by Google

critical for the successful completion of the Army project. It cannot offer such information if it des not know what the Army is doing.

May I repeat that your bill seems most desirable.

Sincerely yours,

Dr. GREGORY PINCUS,
Professor of Experimental Zoology.

EXHIBIT No. 38

SWARTHMORE COLLEGE,
Swarthmore, Pa., April 27, 1943.

Hon. H. M. KILGORE,
United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: I am greatly obliged to you for your letter of the 23d, which accompanied a copy of the science mobilization bill. Having read the bill, as well as the résumé, I feel very strongly that its passage and application would contribute in an important way to the effective utilization of our scientific resources, during and after the war.

In response to your request for comments, I submit the following observations:

(1) It would be desirable if something could be added to section 4 of the bill, to suggest cooperation with the scientific societies of the country. The office would operate more effectively, in my judgment, if instead of lumping together all scientific activities, as provided for in paragraphs (a), (f), and (g), it would maintain close relations with the societies, which exist in the various fields of science, so as to operate to a large extent through them, particularly in the matter of relations with the scientific work of other countries. Information would in this way be better organized, more readily available, and thus more useful.

(2) It would seem highly desirable that an official of the National Academy of Sciences be specifically mentioned in section 3, paragraph (d), as one of the members of the technical committee. Perhaps an even closer tie-up with the National Academy, through its National Research Council, would be valuable.

(3) The emphasis upon international collaboration in paragraph (g) of section 4 seems to me an excellent feature of the bill.

I am very favorably impressed by the plan and spirit of this bill; its introduction seems to me a very encouraging occurrence. It is hardly necessary for me to add that I shall follow its fate with great interest, that I shall be glad to be called upon for such service as I can render in connection with the problems which it raises, and that I shall appreciate the receipt of your further communications concerning it.

Yours sincerely,

ARNOLD DRESDEN.

EXHIBIT No. 39

UNIVERSITY OF CALIFORNIA,
Berkeley, Calif., May 11, 1943.

Senator H. M. KILGORE,
United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: In general I am not enthusiastic about schemes for the organization of scientific research, although in certain cases such organization has its evident advantages. The proposed bill, however, of which you were good enough to send me a copy, meets with my very hearty approval. It is high time that efforts along the lines contemplated were undertaken if we are to utilize our resources of talent and material in ways most effective toward winning the war. We have first of all a single definite and practical aim to be realized in the near future. We want to know at once what are the problems most urgently calling for speedy solution. What defects, for instance, are there in fighting planes, bombers, tanks, guns, and other fighting equipment? In this war, as in World War I, invention counters invention: better tanks or better antitank guns to cope with the enemy's improved equipment, and so on along the line. With our Yankee inventive ingenuity and our facilities for production we can play the game of competitive inventiveness as well as the Germans and much better than the Italians or Japs. This is a war in which the battle of wits devoted to the discovery of improved methods of attack and defense will play an important, if not decisive part. That is why I am so strong for the proposed bill.

Digitized by Google

We should obtain from the individuals actually engaged in conflict all the information possible concerning any improvements of fighting equipment, the procedures for coping with disease, or any other problems whose solution would conduce to the success of their efforts. It would be desirable to have these sources of information circularized so far as possible and as soon as possible to learn more of their needs. We should have this information in the hands of those who are most likely to be able to solve the problems, and to this end we should know all about the special aptitudes of all of our scientific investigators and be able to enlist quickly the services of those best qualified to solve the problems in question. There is no doubt that there would be widespread and willing response to calls of this kind. The need of centralized organization for success in competitive inventiveness is quite comparable to the need for centralized control of military operations in the field.

A great and well organized central clearing house for information on specific needs and on all matters relevant to the prosecution of the war and the maintenance of effectiveness on the home front cannot fail to be of paramount service in the present crisis. Finally, I might suggest the creation of a department or committee on facilitation, whose function would be to avoid delays, eliminate red tape, and in general to get rid of the waste of time which is so frequently involved on operations of governmental machinery.

Hoping that so deserving a measure as S. 702 will be quickly passed and put into operation, I am

Very sincerely yours,

S. J. HOLMES.

EXHIBIT No. 40

THE UNIVERSITY OF NORTH CAROLINA,
Chapel Hill, N. C., April 30, 1943.

Senator H. M. KILGORE,
United States Senate, Washington, D. C.

DEAR SIR: I appreciated very much the preview of your bill (S. 702; H. R. 2100) introduced in the Senate of the United States by you.

I agree with you that science should serve society in some constructive way after the present war effort, and that the future of science and its support must be faced by government as you have suggested in your science mobilization bill.

Evidence that "serious impediments" to the full application of science in our war effort do in fact exist, can be shown by the lack of such activity by as much as 50 percent of my colleagues in the southeastern part of our country.

There is no general clearing house for war problems that can be submitted to the various scientific organizations of our colleges. We are supposed to take the initiative. The initiative to do what? seems to be the cry. We don't know the Army's problems nor the Navy's desires for information, yet we are all anxious to help, especially those of us beyond military age.

I am convinced your bill is the solution. Some who attack this bill on the basis of "regimentation" of science and technology need only review the history of our Public Health Service, our civil aeronautics, and similar services performed by Government to prove how wrong they are.

Several years ago, when our Government first recognized that our entry into the war was unavoidable, it was assumed that the research that would be needed or used in this war was all done, and that the war would be fought with what we had. They thought the same about industrial capacity and designs of planes. Since we can't predict the length of the war, the time available for research to improve the implements of war is also unpredictable.

If the war is long, there arises a vital need for not only continuing research and development but augmenting it in the near future. Without some sort of basic clearing house, as you propose, we may be placed in the position of giving the enemy the initiative and finding from enemy sources what we should have had developed beforehand.

In reviewing the bill I would like to raise the following questions, in the spirit of constructive criticism:

Page 4 (1): What is a qualified person?

Page 4 (14): Does this overlap the functions of the Bureau of Standards?

Page 5 (17): One year should be chosen. Less than 1 year is not enough to evaluate the ability of a potentially able young scientific interested person. In 6 months, only the bare ideas of a subject can be used to introduce the budding young scientist to his major field of endeavor.

Digitized by Google

Page 6 (9): $12,000 not enough salary for the ablest man.

Page 7 (1): The branch office should be a salaried position with title "assistant director" or some such designation.

Page 7 (12, 13, 14): My reaction to this make-up of the board is "it is unbalanced." There should be more scientifically trained men on the board at least one each in the biological, physical, and engineering sciences.

Page 8 (22): This seems to overlap the functions of the Smithsonian Institution and similar museums?

Page 9 (9): Word "impact" not used correctly. Do you mean "effect"?

Page 19 (5) Should the words "data and" follow word "technical" at end of line?

I am taking the liberty of writing to Senator Robert Reynolds (North Carolina), the chairman of your Committee on Military Affairs, to urge him to support this bill, on its merits in accelerating our war efforts.

In appreciation of your interest in allowing me to preview it, allow me to remain

Very truly yours,

OTTO STUHLMAN,
Professor of Physics.

EXHIBIT NO. 41

WESTERN RESERVE UNIVERSITY,
Cleveland, Ohio, April 27, 1943.

Hon. HARLEY M. KILGORE,
Senate Office Building, Washington, D. C.

MY DEAR SENATOR: I have your communication of April 17 on the subject of the science mobilization bills (S. 702 and H. R. 2100).

I am glad that the questions involved in these bills are to receive the attention which they deserve, and I shall do what I may to promote interest in them.

I would venture to point out, however, that in my judgment the bill is so drawn as to define too narrowly the terms "scientific" and "technical." The matter of fact is that such scientific and technical fields as engineering, veterinary training, dentistry, medicine, physics, and chemistry are now fairly well, though inadequately, protected from disorganization as a result of the war effort.

On the other hand such other fields as scientific pharmacy, meteorology, and the whole field of the social sciences, particularly economics, sociology, and government, together with statistics in these fields, are left altogether exposed to the disintegrating effects of our selective service acts.

I think that there is no difference of opinion among educational administrators that the fields to which I refer are in immediate need of attention. Even now the civilian branches of the Government, as well as the armed forces, are finding it extremely difficult to secure trained personnel in these specialties. Business administration, too, and advanced accounting are suffering heavily from the war demands made upon their personnel.

I do not wish to go into further detail, but I do think that it is important to call to your attention the necessity of not confining "scientific" and "technical" to the fields more commonly associated with these terms.

Sincerely yours,

W. G. LEUTNER, *President.*

EXHIBIT NO. 42

MAY 25, 1943.

Mr. W. G. LEUTNER,
President, Western Reserve University,
Cleveland, Ohio.

MY DEAR MR. LEUTNER: Thank you for your fine letter of April 27 on S. 702. I am sorry that illness has prevented my answering it sooner.

Please note that the text of the bill, as now written, defines scientific and technical personnel as "all persons, excepting physicians and dentists" in all of the physical sciences.

Your support of this bill is ineed heartening, and I hope you will use all possible active means to insure its early passage.

Very sincerely yours,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 43

WESTERN RESERVE UNIVERSITY,
Cleveland, Ohio, June 2, 1943.

Hon. H. M. KILGORE,
Senate Office Building, Washington, D. C.

MY DEAR SENATOR: I regret that you have been ill but hope that you are now fully restored.

I would certainly make it a point in connection with bill S. 702 that it would be a mistake to confine the provisions of the bill to the physical sciences. My reason for this is that we are being urged by the Government now to undertake the training of men and women in the field of economics and social welfare, in order to prepare for the necessary service in those areas as soon as the occupation of conquered territories begins.

After the war, also, large numbers of such trained people will be necessary. I hope that some consideration may be given to those problems.

Sincerely yours,

W. G. LEUTNER, *President.*

EXHIBIT No. 44

JUNE 11, 1943.

Mr. W. G. LEUTNER,
President, Western Reserve University,
Cleveland, Ohio.

MY DEAR MR. LEUTNER: Thank you for your letter of June 2 giving me the benefit of your thinking on the science mobilization bill, S. 702.

This whole question of incorporating the social sciences into the provisions of the bill interests me profoundly, and I can assure you that your suggestion will be taken into account. No decisions have been made yet on this, and I am grateful to you for pointing up the necessity to keep the role of the social sciences in mind. I agree with you that there is a major contribution that persons trained in social welfare can make in areas occupied following military victories.

Cordially yours,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 45

UNIVERSITY OF MICHIGAN,
Ann Arbor, Mich., May 13, 1943.

Senator H. M. KILGORE,
Committee on Military Affairs,
United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: I have read the science mobilization bill with interest and have tried to give it my careful consideration.

I feel very strongly that the scientific and technical development in this country should be supported by a strong permanent Department of Science which is on an equal footing with the other important governmental departments. The science mobilization bill may be a step toward the creation of such a department and, if so, I am heartily in favor of it. I am a little troubled, however, in thinking that it may only set up just another agency which is no more powerful or comprehensive than those now in existence.

The Office of Scientific Research and Development has already done quite well in mobilizing scientific personnel. In fact, it seems to me that there are not many first-class physicists who are not now employed on war projects.

Finally, I would like to point out that no organization can be better than the men who compose it. The proposed Office of Scientific and Technical Mobilization will only be successful if you can secure the services of capable men with sound scientific background. I wish to thank you for giving me the opportunity to read and comment on the science mobilization bill.

Yours sincerely,

DAVID M. DENNISON,
Professor of Physics.

EXHIBIT No. 46

WILBERFORCE UNIVERSITY,
Wiberforce, Ohio, April 26, 1943.

Senator H. M. KILGORE,
United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: I have received your letter containing the science mobilization bill which has been introduced into the Seventy-eighth Congress. I am deeply interested in it and would like very much to see it passed by the Congress. We need the organization of our scientific manpower under some centralized authority, both for the purposes of war and those of peace. I shall endeavor to interest some of the Representatives from our State in supporting this bill.

With the hope that the bill may pass and that your own efforts in the field of education may have continued good results, I am,

Sincerely yours,

CHARLES H. WESLEY, *President.*

EXHIBIT No. 47

ALFRED UNIVERSITY,
Alfred, N. Y., April 28, 1943.

Senator H. M. KILGORE,
United States Senate, Washington, D. C.

MY DEAR SENATOR KILGORE: Your communication of the 17th about the science mobilization bill is very interesting to me. The importance of research work in the Nation's educational institutions to the national welfare is known to all. It is true also that it is disintegrating in the presence of the war emergency. Specific research is being pushed at the expense of fundamental research. Any plan like that proposed in the bill is sure to be helpful.

At Alfred University we have the two colleges, the College of Liberal Arts and the New York State College of Ceramics. In the latter a strong ceramic experiment station is maintained by the State and by industry. This, however, so far has shown no bad effects from the war. Some of the research in the Liberal Arts College has been affected, but not too seriously.

I trust that your efforts will prove fruitful and that the bill will pass.

Very sincerely yours,

J. NELSON NORWOOD, *President.*

EXHIBIT No. 48

AMERICAN COUNCIL OF COMMERCIAL LABORATORIES,
June 1, 1943.

The Honorable HARLEY M. KILGORE,
United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: This council, composed of a group of the better known tax paying testing laboratories of the United States, has considered the provisions of S. 702, and has directed me to file a protest against it, and to request that this letter be placed in the record of the hearings in connection with this bill.

First of all, this measure seems to completely ignore the present excellent cooperation amongst scientific technical bodies which are and always have been at the service of government, and which have cooperated thoroughly with the armed forces in the present emergency.

The potential harm to industrial research and scientific investigation contained in this bill lies not so much with the aims expressed, but with those possibilities which are hidden and which undoubtedly will result in the assumption of authority on the part of expanding bureaucracy which this bill creates.

Those who are spending millions of their hard-earned money in the development of processes and in the study of further application of scientific knowledge to the solving of problems of manufacture and production, are completely floored with the thought that this bill provides the means by which the results of their research can be taken away from them and made available to the public at large.

The inventor who, under the Constitution, has heretofore had protection for his brainchild in that he had the exclusive right to the fruits of his industry,

Digitized by Google

is standing aghast when faced with the thought that this protection is now about to be lost to him. He resents the peacetime regimentation which the bill provides.

Inventors and research investigators are responsible for much of the progress that industry has made in the last 100 years. Their incentive to produce has been the profit motive. If the incentive is lacking, as will undoubtedly be the case if the provisions of this bill are forced on the public, I doubt if these people will consider the field of investigation so worth while.

I know of no proposals so far taken more calculated to discourage inventors from spending their money and time or to discourage industrialists from appropriating the large sums necessary for research and study in their laboratories, than the machinery this bill seems to offer to take away the results of their efforts from those who develop new ideas and new processes.

The scientifically minded people of America do not object to anything in wartime which tends to free secrets, inventions, processes, or anything else that will help our armed forces, but they do object, and rightly so, to having the totalitarian form of control over their efforts extend into peacetime, made possible under the provisions of this bill.

A small minority once sought to legislate the drinking habits of the Nation. It was a miserable failure. This bill seeks to control and to regiment the thinking capacity of the scientists. If this bill is enacted into law I predict an equally miserable failure.

In our opinion this bill is a socialistic piece of legislation. It does not take into consideration the true situation regarding the cooperation of technically trained people and their willingness to help in this war emergency. It should be sterilized lest it do incalculable harm to the very thing that has made America supreme under a system of free enterprise.

Yours very truly,

A. R. ELLIS, *President.*

EXHIBIT No. 49

JUNE 25, 1943.

Mr. A. R. ELLIS,
President, American Council of Commercial Laboratories.
Pittsburgh, Pa.

MY DEAR MR. ELLIS: This will express my warm appreciation for your letter of June 1, concerning the science-mobilization bill, S. 702.

Our subcommittee recognizes and is proud of the very excellent cooperation and service which the scientific and technical men of the country are now rendering in behalf of the war effort, and we would agree with you completely in your observation.

However, the inadequacies of existing Government organizations have given rise to conditions which our bill seeks to correct. We have not yet achieved the full participation of scientists and technologists throughout the country in the war program, although these groups have exhibited a desire to give maximum service. For example, the National Roster of Scientific and Technical Personnel lists less than one-third of those available.

Also, we are not taking advantage of the inventive genius of America, as is shown by the relatively small percentage of wartime inventions that are actually applied. In testimony submitted to our subcommittee, it was pointed out that of 1,200 suggestions recommended to the Ordnance Department by the National Council of Inventors, only 4 had been developed. The weakness here seems to be that the council does not have facilities for testing ideas and inventions on a large scale, nor does any branch of the Government. S. 702 would provide the means of utilizing the benefits that accrue from such suggestions as these.

Since patent features of the bill apply only to patents developed by the Government, or through the use of Government funds, the private patents will not be affected by our bill. In fact, because of the provision for the reward to inventors for their work, I believe inventions will be stimulated rather than retarded.

In answer to your observations, may I further point out that in a survey conducted by the National Resources Committee of the most important inventions in the last 50 years, it was found that there was an average of 33 years between the date of conception and the date of commercial success. This report showed that the vast majority of inventors get a small return from his patent.

Digitized by Google

The reward provision of S. 702 would provide compensation for many men who have not benefited from their work.

You express a fear that there is "potential harm to industrial research and scientific inventions contained in this bill." If this were true, it does not seem likely that men such as Henry J. Kaiser, William M. Jeffers, Donald Nelson, and the late Edsel Ford—to list a few—men who have been instrumental in furthering such research, would approve the bill as they have done.

I will, of course, be glad to have your testimony against the bill put on record; however, I would suggest instead that you submit a section-by-section analysis, giving the facts that prompt your group to oppose this legislation. Otherwise, your letter will be recorded, as you request.

Cordially yours,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 50

UNIVERSITY OF MINNESOTA,
Minneapolis, May 4, 1943.

The Honorable H. M. KILGORE,
Senator of West Virginia,
United States Senate, Washington, D. C.

DEAR SIR: I wish to thank you sincerely for your letter of April 23 for the copy of your bill proposing to mobilize the scientific and technical resources of the Nation, etc., and for the brief résumé of this bill.

I greatly appreciate the opportunity which you have given me to comment on this bill.

Many scientists have felt for years that they could contribute materially to the welfare of the Nation if a Government agency were created which would make use of the knowledge and initiative of leading scientists in the further scientific exploitation of our national resources. It is true that certain Government agencies exist, like the United States Bureau of Standards, but their assignments are of a limited nature. Your proposed bill creates the opportunity of making a much more general use, by the Government, of scientists in war and peacetime. It is gratifying to note that your bill recognizes the contributions which scientists are eager to make in the further industrial and agricultural development of the country.

Subject to a few minor considerations, which are given below, I believe that passage of your bill would mark a milestone in Government leadership.

Private industrial concerns have recognized for a long time that the success of their companies depends mainly upon the quality of their research staffs.

Although a small percentage of the profits of the companies is invested in research laboratories, experience over a long period of years has taught that such investments have yielded rich returns. It is not accidental that prominent companies like the General Electric, Bell Telephone, Westinghouse, du Pont, etc., excel in the standing and leadership of their research staffs.

If the Nation at large is going to profit more from the results of scientific research, the Government should recognize the significance of research by allotting grants for this purpose. This could best be done in cooperation with graduate schools of leading universities and colleges, by the establishment of Federal research fellowships. At present, postgraduate research is mainly supported by private organizations, like the Rockefeller Foundation, the Carnegie Corporation, etc. Without underestimating the beneficial and important results of this support, it seems appropriate and desirable that the Government recognize the national importance of fundamental research.

I believe that it would be desirable to stress this point more specifically in your bill, and to add a clause to section I, e. g., as follows: "(13) To promote fundamental research in leading universities and colleges by the assignment of grants-in-aid of research."

I also believe that in another respect, valuable cooperation with universities and colleges could be attained. The many new theoretical and practical discoveries in the natural sciences are difficult to follow and digest, even by leaders in research in universities. It is hardly possible for those graduates who have left the university, and who are engaged in industrial, or other nonacademic

Digitized by Google

research, to keep acquainted with the progress of the sciences. It would be desirable to have offered by universities concise courses covering the progress of the various sciences during the last decade or so. It is, therefore, suggested to add the following clause to section I of your bill: "(14) To support and encourage universities and colleges in the presentation of comprehensive courses for postgraduates, and other interested parties. These courses should cover the recent progress in the various fields of the sciences."

Furthermore, I believe that one more clause could be added to section I: "(15) To assist civilian defense organizations in making available all scientific information which is of importance in connection with the protection of the civilian population in a period of war."

It is gratifying to read on page 8, "Powers of the Office," that the Office shall vest with several powers and duties. However, from sections 5 and 6, it appears that all the powers are vested with the Administrator of the Office of Scientific and Technical Mobilization. Other powers vested with the Administrator are mentioned on page 6 of the bill.

Evidently, the six other members of the Board serve only in an advisory capacity.

The proposal to vest all powers with the Administrator instead of with the Board is most undemocratic. You are urged to reconsider this section, and other sections mentioned dealing with "powers," and to vest all powers with the Board instead of with the Administrator. With the present proposal, I am afraid that no self-respecting scientist would consider becoming a member of the Board.

Yours very sincerely,

I. M. KOLTHOFF,
Professor and Head, Division of Analytical Chemistry.

EXHIBIT No. 51

MAY 24, 1943.

Prof. I. M. KOLTHOFF,
Professor and Head, Division of Analytical Chemistry,
University of Minnesota, Minneapolis, Minn.

DEAR PROFESSOR KOLTHOFF: This will express my warm appreciation for your very fine letter of May 4 concerning the science mobilization bill, S. 702.

It is very helpful to have such constructive suggestions as you have made and also very encouraging to receive your support. I recognize that no adequate proposal on the subject of the integration of our scientific efforts could be made to Congress without the active participation of our leading scientific people. And this was my main reason for writing to you.

I am in full accord with all the suggested improvements which you have made and assure you they will receive full consideration by our subcommittee. However, by way of explanation, I would like to comment briefly on the powers vested in the Administrator. In considering the position of the Administrator in the proposed Office the authors of the bill felt that in the centralization of authority, it was necessary to provide for sufficient freedom of action under which the Administrator might operate and, at the same time, some reasonable check to prevent the abuse of this authority. This check, we feel ,is provided for by—

1. Having the Board representative of the total economy.
2. Having the Board selected by the President.
3. Providing that the Board "shall have access to all the information of the office relating to the administration thereof."

It was our belief that this represents a reasonable compromise and that the Board will be in a position to "smoke out" to the President any unfavorable action of the Administrator.

I hope you will feel free to make any further recommendations as you may feel desirable and that I may count on your continuing support and interest.

Sincerely,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 52

BOEING AIRCRAFT CO.,
Seattle, Wash., June 28, 1943.

Subject: S. 702.

Senator HARLEY M. KILGORE,
Senate Office Building, Washington, D. C.

DEAR SENATOR KILGORE: In the past few days, I have had the opportunity to study a copy of S. 702, and should like to offer a few comments regarding this bill.

The general purposes of this measure are stated to be the mobilization of scientific and technical resources of the Nation, and to encourage and protect the research and enterprise of inventors, scientists, and technicians. These broad purposes are supplemented by others, including the appraisal and coordination of facilities and personnel, the discovery and development of substitute materials, contribution of assistance to industry, and similar objects.

That these objects, in general, are desirable seems fairly evident. The questions which arise are whether or not our present system is adequate and if not, whether the provisions of the bill are such as to achieve the objects stated.

As defined by section 2a of this bill, scientific and technical facilities include virtually every form of property (in the word's broadest sense) which is connected in any way whatever with scientific or technical work. "Technical" is a broad term, and under the definition set up, scientific and technical facilities would include not only facilities devoted to pure research, but virtually every factory, from the largest to the smallest, and even the crossroads garage, which certainly is used for "technical" purposes, and likewise would include every process, method, technique, etc., used in any branch of our industry. Thus, it seems that "scientific and technical facilities" would include virtually our entire industrial machine, regardless of its ownership. "Scientific and technical personnel" is likewise broadly defined and would include every scientist, engineer, physicist, and even every skilled mechanic in the Nation today.

Under the provisions of section 4 (b), the Office of Scientific and Technical Mobilization would not only be able to formulate and direct development, but also would be empowered to initiate and carry out projects for the use of technical facilities (Section 4b). Thus the Office would be empowered not only to engage in research, as does, for example, the National Advisory Committee for Aeronautics at present, but also to place the results of such research into use. Conceivably, the Office would be empowered to enter into the manufacture of aircraft, or any other article of commerce, in competition with private industry. While it is entirely possible that such a result was not contemplated in the drawing of the bill, the result obviously could be achieved within the provisions of the measure, for not only is the power given to initiate and carry on such projects, but also the Office is given power to form corporations in order to carry out its powers (sec. 9b), make contracts, acquire property, etc. (sec. 4j).

The powers granted the Office by section 4 (b), mentioned above, seem very broad, especially when coupled with other provisions of the bill. Under section 4a, for example, the Office would have available complete information regarding all scientific and technical facilities and personnel. Thus the Office would be in a powerful position, able to compete with private research and industry on terms which would be disastrous to private enterprise. True, the Office would also have the power to make such information available to industry (sec. 4h), but only upon request, and the Office is not required to so distribute information.

With the apparent purpose of obtaining patent rights to assist the Office in carrying out its functions, section 7a provides for the acquisition of such rights. By this section, the Office is vested with the exclusive right to use and license any invention, discovery, patent, or patent right to which the Government has contributed any money, credit, physical facilities, or personnel, or which becomes to any extent the property of the Government. Thus, should the Government acquire even a tiny interest in an invention, or should it contribute ever so small a fraction of the total development, it instantly acquires the exclusive right to use and the exclusive right to license others. The actual inventor, who may have contributed many times the money and effort contributed by the Government, is completely out of the picture, and must license from the Office the right to use his own invention on the same basis as any outsider who has contributed absolutely nothing.

I sincerely doubt that you intended this provision to be as powerful as it is. The section seems particularly strong when one reflects that if the office were in operation, virtually every invention might be construed to owe some part of

Digitized by Google

its development to contributions of one sort or another from the Government, and the office thus might ultimately come into control of the major portion of the patent rights in this country.

It strikes me that this provision would not be one that would encourage and protect the research and enterprise of inventors, scientists, technicians, etc., for the office would be in a position to dictate (through its powers to formulate programs and render financial and other aid) the course of development and it would then seize the patent rights. The usual incentive, given by the patent system, to individual initiative and capital, would be removed.

While I do not take the position that our present system of research, development, and manufacture is faultless, and that any attempt toward improvement would be fruitless, I do feel the immense progress which we have made, most especially in the past 3 years, speaks most highly of private enterprise. Likewise, I am inclined to doubt that complete Federal control would eliminate the difficulties which do exist.

I therefore suggest that the bill be dropped or most carefully reviewed, with a view to preserving our American way of free enterprise and avoiding autocratic and bureaucratic control that would have an adverse effect on our institutions and progress.

Very truly yours,

W. E. BEALL,
Vice President, Engineering.

EXHIBIT No. 53

JULY 6, 1943.

Mr. W. E. BEALL,
Vice President, Engineering, Boeing Aircraft Company,
Seattle, Wash.

DEAR MR. BEALL: This will express my appreciation for your intelligent analysis of the major provisions of S. 702, as expressed in your letter of June 28.

I regret that you see certain adverse implications in this proposed legislation. It is my intention to find a way to aid scientific and technical men to make a maximum contribution to the conduct of the war, and in coping with post-war problems of the transitional period.

Your protest will be placed before the subcommittee currently studying this bill; but should you care to examine the testimony that continues to impress me with the importance of this bill for the Nation, I shall be glad to send you copies of our public hearings on the measure.

May I assure you that the bill is being carefully reviewed by the subcommittee at the present time.

Very sincerely yours,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 54

AMERICAN GENETIC ASSOCIATION,
Washington, D. C., July 1, 1943.

Senator H. M. KILGORE,
Committee on Military Affairs,
Washington, D. C.

DEAR SENATOR KILGORE: The undersigned is answering your letter to Dr. C. E. Leighty of June 18, relative to war mobilization and the use of technically trained personnel. It happens that, on account of his wide acquaintance among genetic workers, plant and animal, in this country, he has been asked by Dr. Leighty to answer your letter and the questionnaire.

In addition to the specific questions answered in your questionnaire, I should like to make some more general remarks regarding the use, or rather the failure to use, highly trained and highly skilled biological workers in furthering the war effort. In total war, which is fought not only at the point of contact with the enemy, but in full depth back to the humblest hamlet in our mercifully as yet untouched land, the essence of effective strategy is to use the specialized skills of all of our people to the utmost. And in a total war today,

Digitized by Google

which is industrial and technological as well as military, there are very few skills which cannot be used as the utmost efficiency to further the war effort if we use initiative and imagination to harness them into the war effort.

Outstanding as our accomplishments have been on many sectors of the total war front, I submit that the use of biologists has been ill conceived, unimaginative, and stupid. Valuable techniques, learned in years of painstaking laboratory work, have been far too often completely disregarded and the hand and eye which has been trained to use the microscope and the fine measurements and observation of the laboratory has been trained to our great loss to function only as a trigger finger to a machine gun. Far be it from me to belittle the heroic self-sacrifice of those whose trigger fingers must stop the enemy at the point of contact. But in these days of specialized warfare, heroism on the field of battle is futile if a multitude of specialists in the laboratories and the factories fail to do their essential job too. I am dogged by a haunting fear that our enemies are using the specialized skills of their technical workers more effectively than we are. This war will not be won by mock heroics and by rushing off our experts to become a vicarious sacrifice. It will be won by using our skills on the battlefields and behind the lines with maximum effectiveness and efficiency.

Two instances will illustrate what I mean. A few years ago one of our large industrial corporations wrote me regarding candidates for a long-term project in flax genetics which they were undertaking with a view to developing specialized fibers of this important plant. It happened that I was able to be of service in finding them a competent and adequately trained worker who could do this job.. Since his appointment he has been laying the ground work for giving the fiber technologists by selective breeding the kinds of fibers they need for special purposes, and specialized fibers are vital to the war effort. Just a few weeks ago I had a frantic letter from the president of this concern asking me if I could nominate a substitute, preferably a woman, who could take over this man's work as he had been classified 1–A. Since this is a technological war as well as a military war, and since it is utterly impossible to find anyone on the spur of the moment who can bring to this particular problem the cumulative experience of several years, it is obvious that drafting this unique worker means that a program of definite importance in national defense was about to be almost as effectively sabotaged as though a German agent had had his way with it. Perhaps on the basis of the very strong letter I wrote pointing out this fact, I have been informed that this particular worker has been temporarily reclassified. In a total war, to pretend that such work is not more important than retraining unique skills to be sacrificed on the battlefield is a stupidity I doubt our enemies would be guilty of.

In another instance I was able to stave off an ill-conceived enlistment by a uniquely trained medical statistician until such time as the Army could figure out a way to utilize his skill effectively. The difficulty was that the person having this particular constellation of badly needed skills was a Ph. D. and not an M. D. He was needed in the medical corps for epidemiological work. It took the Army 6 months to figure the formal (and in the context stupid) evasion that he would be commissioned in the sanitary corps and then loaned to the Medical Corps because a mere Ph. D. could not be commissioned in the Medical Corps—and a commission was essential to do the job required. One would imagine that utilization of the skills and not the commission or formal rules in a time of crisis was the important point. But under military convention, it was necessary to have a commission to do the job. This particular specialist is now overseas in a capacity which I am certain is more essential and is contributing much more to victory than would have been the case had he been drafted as an infantryman, or if he had followed his own inclination (when the attempt to find a way to use him seemed to have hopelessly bogged down) and enlisted in the Marines.

The main thesis of this longish note documented by two instances out of many, is that the workers in biology, trained for years in specialized laboratory and statistical techniques, do have a place in total war and that at present these skills are mostly being tragically wasted. If your committee can do anything to correct this situation and to enable the small but essential group of specialists to be more effectively utilized it will be a very valuable contribution to victory.

Very respectfully yours,

ROBERT C. COOK, *Editor.*

EXHIBIT No. 55

STATEMENT BY AMERICAN GENETIC ASSOCIATION

1. What is the purpose and brief historical background of your organization, including qualifications for membership and the names of its officers?

Answer.—The American Genetic Association was organized in 1903 as the American Breeder's Association. The organization committee was appointed by the Association of Land Grant Colleges to encourage the fullest use of the newly discovered Mendelian principles of heredity. The Secretary of Agriculture, James Wilson, was president of the association from 1903 to 1913. David Fairchild, distinguished botanist and plant explorer, has been president since that time. The association is incorporated as a nonprofit, scientific society under the laws of the District of Columbia. Membership is not limited to professional geneticists but is open, subject to approval by the council of the association, to all who are interested in the increase and diffusion of knowledge regarding heredity. The officers are President David Fairchild; Vice President Sewall Wright, of the University of Chicago; Secretary C. E. Leighty, of the United States Department of Agriculture; Treasurer C. E. Leighty.

2. What is the total membership of your organization? Could you estimate the potential total of men in the fields covered by your organization?

Answer.—Membership totals about 3,500. It is difficult to say exactly at this time because we are out of contact with so many foreign members on account of the war. Among the members of the association are to be found many of the leaders in genetic research in every part of the world. Many of these contribute to the Association's Journal of Heredity, which is recognized as a unique medium of publication in this important field which deals with crops and livestock improvement, and with the thorny question of quality and quantity of human beings. In the United States there are from 12 to 15 hundred professional geneticists who are to be found on the faculties of colleges, in the State experiment stations, and in research for commercial corporations (seed growing, fiber production, food production, etc.). Including agronomists, animal husbandmen, and allied workers, the total might be double or triple this.

3. Please outline the experience of your group with respect to the operation of the Selective Service System since the inception of the latter. If the information is available, this should include the number of men drafted by the armed services, the number of men who enlisted, and the number of men who have been deferred.

Answer. Such a group of specialized workers naturally presents a problem to selective service boards. It is still hard for many of us to realize the implications of total war to a complicated economy such as we have in the United States. It is also true that in scientific research, it is extremely difficult to "call one's shots" in advance, to say categorically that a given research project will yield at a certain date a definite solution to the problem. But in the whole context, theoretical and applied genetics has made tremendous contributions to American agriculture. (See the Genetic Yearbooks of the United States Department of Agriculture for 1936 and 1937 which summarize progress to that time.) And it is not easy for the selective service boards to understand the implications of this situation to the war effort. From letters of inquiry and complaint received from geneticists, and in conversation with Government and experiment station officials in many parts of the country, it is clear that the selective service boards have tried conscientiously to balance the conflicting needs and urgencies of the situation. Where the research directors have tried intelligently to interpret what is going on to the selective service agencies, deferments have generally been granted to irreplaceable workers. In other situations, either because of a failure to do an adequate job of explanation, or because the total implications were not understood, there have been some tragic miscarriages. It seems that the selective service organization has not given realistic consideration to the importance of biological research, and to the return, which a very small group makes to the national welfare. Thus the drafting of a tobacco geneticist might seem to be completely justified if it were not understood that his research on the inheritance of alkaloids, much more effective than nicotine as insecticides, holds the key to large savings of manpower and to larger crops for the same outlay. Thus to draft him might mean an enormous waste of manpower on the agricultural front. The lack of any definite policy with respect to such problems and the failure to realize how tragically wasteful some refusals to grant deferments have been, underline the need for a better integrated and more realistic policy.

Digitized by Google

4. Which of the Federal agencies are supposed to advise Selective Service as regards whether members of your profession should be considered for occupational deferments?

Answer. The answer to this question is not clear, and that is not because of any failure to try to arrive at it. The undersigned has conferred and corresponded with a number of agencies, the National Academy of Science and the National Research Council, the Federal Department of Agriculture, and the Selective Service organization. The writer has been promised statements by the Selective Service regarding the deferment of biologists and geneticists. As far as he is aware, no statement has ever been forthcoming. No agency seems to have been definitely charged with evaluating this difficult problem and with stating the general principle on which specific decisions should be based. If such exist, they have escaped detection by the writer.

5. Do you think that the present Selective Service organization insures adequate consideration of the national interest as regards its handling of the cases of the members of your profession? What changes, if any, would you suggest to insure such consideration? Would you favor placing complete authority for classification of your profession in a central national agency, subject to only quotas determined by the War Manpower Commission?

Answer. In talking with many administrators and scientific workers, it is the conviction of the writer that the national interest is not being adequately served in handling the drafting or deferment of biological workers. The placing of these workers, after they have been drafted, is inept. Frequently men who have had years of highly skilled training, which would surely make them much more valuable as technologists in the medical services than as combat troops, are assigned to the infantry. Too rarely have the special skills been utilized. The writer has had a number of conferences with members of the Division of Biology and Agriculture and the National Research Council regarding this perplexing and important matter. One suggestion was to appoint in this Division of the National Research Council a committee made up of specialists in genetics, medicine, physiology, and other biological sciences to survey this situation and recommend ways and means to utilize to the full the highly specialized skills which unquestionably can be of tremendous value in fighting a total war. A realistic assay of any biological research program should make it possible to determine: (1) the potential value of specific research in total war (immediate and long-term); (2) the likelihood of discoveries calculated to increase the yield of critical materials, save manpower, etc., etc. If such an assay were the basis of deferment, the net gains accruing to the military and economic advantage of the United States would be enormous. It is never possible to predict in advance whether a given piece of research will yield methods and information of technological value. The returns from the researches which do "hit" are so great and frequent enough so that a comprehensive and intelligent handling of this problem along such a line would yield tremendous returns in military and economic strength. The drain on manpower, were such a policy applied to the entire field of biological, biochemical, and medical research, would be so slight as to be trivial. Instance after instance can be cited wherein genetic research (and biological research generally) has yielded tremendous technical advances. To cripple this flow of new and vitally needed knowledge when so few are involved is the utmost in shortsighted folly. Yet this seems never to have been realized in the development of our war plans, to our great loss.

6. If you favor the latter course, do you think the National Roster of Scientific and Specialized Personnel, as presently constituted or as it might be reorganized, should be the agency to allocate professional manpower? If not, what other agency do you think should be given this responsibility?

Answer. The Roster or Scientific and Specialized Personnel has information regarding the qualifications of science workers in all fields. But the staff which administers the roster, as far as is known, is not of the type that would be able to evaluate adequately specific research and investigational projects. This should be done by a group of leaders in the various fields—men of wide experience themselves, whose decisions would be based on supporting evidence regarding each specific research project. As now constituted, the Roster of Scientific and Specialized Personnel would not, in the writer's opinion, be a satisfactory referee of this important problem. Possibly the committee to make such decisions could be set up under the roster, but the Division of Biology and Agriculture would seem a more logical and better-equipped agency for this purpose.

EXHIBIT No. 56

OAKMONT, PA., *May 19, 1943.*

Hon. H. M. KILGORE,
United States Senator, Washington, D. C.

MY DEAR MR. KILGORE: I have your letter of April 23 requesting my opinion on the science mobilization bill (S. 702) which has been rather extensively discussed among technical people.

In common with most chemists and engineers with whom I have discussed the matter, I am very decidedly of the opinion that the proposed intervention of the Government in this matter would be very deleterious to the national welfare and to the progress of science and invention. The record of Government scientific agencies in the past certainly does not encourage one to believe in their ability to control and coordinate the research of the country's industries, and I see nothing in the record to justify the confiscation of any or all of the results of scientific research which have been developed at the expense of private parties, and which will ultimately escheat to the public anyway through the normal operations of the patent system.

Sincerely yours,

FRANCIS C. FRARY.

EXHIBIT No. 57

DIAMOND EXPANSION BOLT CO., INC.,
Garwood, N. J., May 21, 1943.

Hon. HARLEY M. KILGORE,
The Senate, Washington, D. C.

MY DEAR SENATOR: I was very much interested in your bill S. 702.

Lest my silence on this subject should be taken as acquiescence to the act, I am taking this opportunity to express to you my complete disapproval of the entire theory of Government ownership or control of scientific research and invention, in a manner outlined in this Kilgore bill.

I cannot too strongly recommend that you give it your most careful consideration.

Necessary use of inventions in war time is already in the hands of the President and this new unlimited power is proposed to be placed in the hands of an office of scientific and technological mobilization for peacetime progress and prosperity with practically unlimited power concerning the use of such developments, compensation, and ownership, and this power to continue after the war.

It is the most far reaching act of legislation that I have ever seen proposed on this subject. It would remove from the individual inventor all incentive and initiative for further improving and developing the arts and sciences with which our country has progressed so satisfactorily in years gone by.

The great danger is that the mere offering of such legislation, even though not passed at present, is likely to result later in a compromise which would be detrimental to the patent system under which we have prospered.

So far as I can see, carried to its extreme, the enactment of this bill might just as well carry with it the complete abolition of the Patent Office and our present patent system.

I know from experience the great benefits that we have all enjoyed in the advantages accruing to the inventor as well as to the public at large and to stifle such future progress would be to lose a continuance of the benefits which which we have accomplished to date.

The scope of this proposed law is defined as follows:

"'Scientific and technical facilities' shall include real property and personal property, tangible and intangible, used or intended to be used for scientific or technical purposes, programs, research, projects, and developments, and shall include further all methods, processes, procedures, techniques, designs, specifications, patents, inventions, and scientific or technical information or knowledge of every description."

This would stifle incentive on the part of inventors. They are as a rule a class of men who know how to think and they will not willingly be regimented into any such plan as this.

While the Government could under this law acquire all the powers set forth above, there is one thing they can not acquire. It may acquire property, plans, methods, and technical information of all industries but it cannot compel a man

Digitized by Google

to divulge what is in the gray matter beneath his cranium, a $5,000 fine or imprisonment notwithstanding.

I therefore trust that you will consider fully what such legislation would mean to our country.

Sincerely yours,

H. W. PLEISTER, *President.*

EXHIBIT No. 58

JUNE 19, 1943.

Mr. H. W. PLEISTER,
President, Diamond Expansion Bolt Co., Inc.,
Garwood, N. J.

DEAR MR. PLEISTER: Thank you for your letter of May 21, concerning S. 702, the science mobilization bill.

Through the hearings held on the science mobilization bill before our subcommittee, we have found that not more than 15 percent of the personnel and facilities of the engineering research laboratories in the country are actively engaged in significant and effective war work.

We have found that, of 1,200 ideas referred by the National Inventors Council to Army Ordnance, only 41 have been considered seriously, and only 4 have been developed and completed.

The office would open a way for researchers and inventors to present their ideas—a way that would encourage their enthusiasm rather than retard it.

It is the clear intent of the author of the bill that fundamental research not only be extended and encouraged, but that it not be shackled by restraints of any kind. The author wants to see the Government going out to the people and scientists and bring them into the war effort at the highest level of their ability.

I wish to assure you that your views will receive full consideration by our subcommittee.

Very sincerely,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 59

FORD MOTOR CO.,
Dearborn, Mich., April 22, 1943.

The Honorable H. M. KILGORE,
Washington, D. C.

DEAR SENATOR KILGORE: I appreciate receiving your letter of April 9, together with copy of your science mobilization bill, S. 702.

You are quite right in assuming that many of the points contained are in line with our ideas for the spreading of information and cooperation for the greatest benefit of the war effort.

I can speak best for the automotive industry, where much progress is being made along these lines, both through the automotive council for war production and the engineers from automotive industries on the Society of Automotive Engineers' war engineering board.

I would suggest that duplication of effort be avoided and that no additional burden be put upon technical supervisory staffs, who are at present covering about as much work as is possible.

Yours sincerely,

EDSEL FORD, *President.*

EXHIBIT No. 60

MAY 18, 1943.

Mr. EDSEL FORD,
President, Ford Motor Co.,
Dearborn, Mich.

DEAR MR. FORD: I greatly appreciate your letter of April 22, stating your general approval of S. 702.

The object of the bill, of course, is to avoid duplication of effort and to increase the effectiveness of technical work by a coordination of effort. The object would be to relieve individuals of excessive work rather than adding to their burdens.

Very sincerely yours,

H. M. KILGORE,
United States Senate.

EXHIBIT No. 61

THE DETROIT TESTING LABORATORY,
Detroit, Mich., June 4, 1943.

Subject: Kilgore bill, S. 702.

Senator HARLEY M. KILGORE,
Chairman, Subcommittee on Technological Mobilization of
Senate Military Affairs Committee,
Senate Office Building, Washington, D. C.

DEAR SIR: As an interested independent commercial laboratory which is now rendering the greatest possible service to our Government during times of stress and to the public at all times, we are taking the liberty of addressing you relative to the Kilgore bill, S. 702.

As scientists and as a free-lance laboratory, we are best able to serve in our various capacities when oppressive governmental agencies are not making restrictive measures too onerous.

To shackle technical endeavor is another way to kill individual initiative and thus hinder progress in developing new methods and new products so essential for our greatest national economic development. We believe the Kilgore bill, S. 702, while containing some valuable ideas for a coordinated scientific economy, also includes much that is vicious. No one man, no matter how well intended, can possibly be endowed with the wisdom for the equitable administration of a bill so sweeping and all inclusive as the Kilgore bill, S. 702.

The objects of the bill in general are now successfully accomplished by the voluntary services such as the national scientific and engineering societies are now rendering to our Government, and have always been anxious to render in any and all emergencies.

Regimentation of skilled men and women will not work in a democracy such as we have enjoyed over the years. Too many bureaus are already interfering with our progress in technical development. We can better serve where full freedom of action prevails.

We believe that the Kilgore bill once released from your committee will be subject to an avalanche of protests from all scientific interests now dependent on the free exercise of individual initiative, in sufficient volume to defeat same on the floor of the Senate. In this belief we appeal to your sense of justice and on behalf of the greatest good to the greatest number as well as economy to voice your opposition to the Kilgore bill now before your committee.

Very truly yours,

THE DETROIT TESTING LABORATORY,
Per W. P. PUTNAM, *President.*

EXHIBIT No. 62

LOS ANGELES COUNTY MUSEUM,
Los Angeles, Calif., April 29, 1943.

Senator HARLEY M. KILGORE,
Committee on Military Affairs,
United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: I greatly apreciate your letter of April 21 with enclosures respecting the science mobilization bill (S. 702). If this measure becomes law in the not too distant future, it will certainly be most opportune as a war measure. We have witnessed many cases where technically trained men have been inducted into the armed forces and placed in combat divisions and their special training and talents thus lost to the Government. If the draft continues in the future along the lines on which it has operated in the past, our scientific staff is likely to be almost completely wiped out.

There is another angle of this bill that particularly interests us. I refer to that section on page 3, lines 2, 3, and 4, which happens to bear directly on one of our acute problems.

Ever since Pearl Harbor our scientific staff has been engaged in the preparation of a manuscript covering diseases transmitted by insects, particularly those of tropical areas in which our troops are now engaged or which they may later occupy. This work has the official approval of the Surgeon General of the United States Navy and the Director of the Bureau of Entomology, Department of Ag-

Digitized by Google

riculture. The author is our staff entomologist, Dr. W. Dwight Pierce, a man who is internationally known for his work in sanitary entomology. His book on that subject was widely used in the last war. There is no up-to-date work covering this particular field. I am certain that its early publication would save the lives of thousands of Americans in tropical regions and in our own country after the return of our troops.

Our chief difficulty now lies in the fact that no governmental agency has any authority or funds available for the printing of this work and its distribution after the manscript is completed. We may of course be able to get private backing, but it would tremendously expedite matters if the board created by your bill had both the authority and the funds immediately available.

I hope you will keep my name on your mailing list for all published material pertaining to Senate bill 702.

Sincerely yours,

JOHN ADAMS COMSTOCK,
Associate Director—Science.

EXHIBIT No. 63

STATE COLLEGE, PA., *May 10, 1943.*

The Honorable HARLEY M. KILGORE,
The United States Senate, Washington, D. C.

DEAR SIR: You are to be highly commended for recognizing the urgent need for immediate action realtive to the scientific resources of the Nation. Reference "A bill to mobilize the scientific and technical resources of the Nation, to establish an Office of Scientific and Technical Mobilization, and for other purposes" (S. 702).

The situation of scientific research in this country at this time is much more serious than is generally realized. There are actually only a few hundred scientists doing original and fundamental work in this country, and this number is rapidly decreasing. Unless corrective measures are applied very quickly this small number will reach the vanishing point. This will be very detrimental for the Nation both in regard to the war effort and for its industrial progress in peace.

Russia, some 20 years ago, recognized the value and importance of scientific work and initiated a very considerable effort to establish a program of scientific research. At present the scientific production in Russia is of high quality and considerable quantity. The effort to establish this program has been both great and recent, so that Russia will not allow it to lapse at the present time despite manpower and other shortages. We fail to appreciate either the values of our scientific programs or the great amount of both time and effort needed to establish them. They have grown with us gradually so that now we are allowing them to lapse without consideration of the great loss involved. It is reported that Russia has placed 50,000 men in scientific research at this time during this war. The astronomers in Leningrad continued their work in astronomy and in their accustomed environment during the siege of that city. (Science, vol. 97, p. 237, March 12, 1943.) Russia recognizes as we apparently do not (until your bill) that a continuance of fundamental, pioneering, and original scientific research is vital for the Nation both in war and in peace.

Japan has also in recent years been trying to establish a program of scientific research. It knows both the values of it and the time and effort necessary to establish it. We can be reasonably sure that Japan is not allowing it to lapse at this time.

Whether the war be long or short and whether we win in a military way or not, we shall certainly lose in the peace to follow if we allow our fundamental scientific research to lapse as we are now doing. Creative science cannot be stopped and started again at will like an electric motor. Once a research program is stopped it takes a great deal of effort and time to make it productive again. Removing from his accustomed environment a productive scientist will cause a loss of many years in his creative work. Even returning him to the same locale will not in general save much of this time. This is in part due to the amount of highly specialized and individually constructed equipment used frequently. These facilities are not purchasable and the techniques of their use are not found in published literature. Trained helpers are also part of the problem. A greater part of the difficulty, however, lies in a body of intangibles which may be called atmosphere. Scientific research is a creative enterprise and depends to a large

Digitized by Google

measure on the birth of ideas in the minds of the scientists. Being unable to either command or demand original ideas, we should cultivate them where they are found and preserve the environment of the men with a record of scientific production. A change of environment may greatly retard progress.

There has been considerable criticism of this bill (S. 702) in scientific and technical circles. In this connection I have been requested to send to you and to other Senators and Representatives copies of a recent article of mine, Research in Wartime, which was printed in Science April 30, 1943, volume 97, pages 390–392.

The criticisms of this bill are directed not to the sincere and worthy motives which prompted it but to the methods outlined in the bill for obtaining the desired ends. Part of this difficulty is due to the lack of a clear differentiation between fundamental and original scientific research on one side and development work and the collection of data of value on the other. The latter is useful but it is not in need of help at this time as it is well provided for. The need for help for the former is critical. Another reason for the criticisms comes from the activities of some of the war agencies organized to deal with scientific and technical problems. Frequently these agencies in energetically endeavoring to arrive at their own immediate objectives have neglected larger values which may have seemed not to come under their specific programs, or they have actually without direct intent tended to retard original scientific research. Instead of providing funds, facilities, and assistance (priorities and deferments) for the creative scientists, they have done the opposite. They have absorbed his time and energies and have made use of his facilities, space and equipment for development work or for the collection of data. If this creative work is not stopped for this reason, it stops because of the lack of funds, help, priorities, and deferments. Thus our fundamental scientific work is rapidly stopping. The selective service rules give an example of how this operates. According to them a graduate student in science (one engaged in assistant and in learning scientific research) is deferred under two conditions only. Either he must be assisting in teaching for approximately half his total time or he must be engaged on a research project sponsored by a Federal agency. This, of course, bring to a stop much of the fundamental research in the colleges and universities as there is no Federal agency that will sponsor fundamental scientific research. Surely fundamental science is as important for the war effort and the national welfare as the development work carried on under Federal agencies or as half time assisting in teaching.

It is difficult to visualize how the bill (S. 702) as written could achieve much of the desired good for our urgent and vital scientific needs. It should be appreciated that science advances through the creative ideas that come to the minds of scientific workers. These cannot be ordered or demanded, and the long and painful history of civilization amply shows that dictation or regimentation tends to prevent rather than cultivate them. As the ideas and the material achievements founded on them do not exist prior to their creation, it is impossible to anticipate them with rules and laws. Conceive of passing laws governing modern communications and transportation prior to the discovery of current electricity.

There is one thing that can be done and this most surely should be done quickly—provide suitable funds, facilities, and assistance for those men who have demonstrated creative ability in fundamental science. Help them with priorities and deferments. Give them helpers to increase their productivity, also students for the continuance of science and scientists. Free them from routine tasks and encumbrance them with a minimum of dictation or direction.

There seems to be no real need for concern about the utilization of science once it is created. There are many Government agencies and departments in industries designed for this purpose and equipped and experienced in it. Greater compensation for the creative scientist working on fundamental problems would stimulate more creation and would retard any tendency to hold new ideas secret in an attempt to capitalize on them. At the present time there is one probably necessary hindrance to the rapid utilization of scientific discoveries. This is the military secrecy orders on certain subject matter. This secrecy has in certain instances tended to prevent the development of useful ideas.

I hope that you will read the enclosed reprint on Research in Wartime. I wish to call to your particular attention the definitions of scientific research and the seven-point program for furthering wartime research.

84949—43—pt. 3——5

RESEARCH IN WARTIME

By Prof. J. H. Simons, Pennsylvania State College

[From Science, Apr. 30, 1943, vol. 97, No. 2522, pp. 390–392]

At a time when the Nation is engaged in a gigantic war that will determine the very survival of civilization, it is appropriate to examine all our activities in the light of values in the war effort. The only purpose of any real significance for anyone's actions is the defeat and destruction of the enemy. All personal or political motives represent various forms of treason. Every activity not contributing to the war effort should be either stopped or redirected. Scientific research should be examined with this point of view.

Modern war requires modern weapons, and these are directly the product of scientific research. It is true that it is a long way from the birth of ideas in the brains of the scientists, their demonstration, verification, and study in the research laboratories to the final perfection of powerful weapons for the destruction of the enemy or of materials and tools for the aid and comfort of ourselves and friends. This way, however, follows a direct path that is fully recognized. From the source of the original ideas it progresses through development, engineering, trial, and production. All the weapons, tools, and materials of vital importance in the war, to a very considerable extent, have had their beginnings in the scientific research laboratories. The research of the past produced our present practices and materials. New things for the future will have their beginnings in the research being done at present. The only sure way of not having new weapons or major improvements of old ones is to stop scientific research.

Research is a word that is used for different meanings by different people. In some industrial firms it is made to include the development of industrial processes after the original ideas are all well founded. In other places it is used to include data collecting or the operation of well-known and recognized techniques on a small scale in a laboratory. These activities coming under the name "research" are easily evaluated in relation to the war effort. A process or machine should be developed if it contributes directly to the war effort. Data should be collected if there is a wartime need for it, but otherwise not. In the same way small-scale laboratory operation of known techniques should be continued or not in relation to the use or nonuse of the product for the war effort.

The more subtle meaning of the word "research"—the birth, demonstration, verification, and study of new ideas—is a much more difficult thing to evaluate. This type of work is chiefly done in college and university laboratories. To the layman it appears to be only an academic exercise as it is not clearly defined, is not represented at that time by human use on a large scale, and most frequently is clothed in a formidable garment of technical terms. Neither industrial nor Government funds are available for it, as the results to be achieved cannot be written out in advance. All industrial firms and Government agencies require well-formulated objectives for a project as well as a detailed outline of methods of procedure. For fundamental and original research as defined above, these are completely impossible. The real cost of this kind of work comes chiefly out of the hides of those whose artistic or fanatical urge causes them to do it. It comes in the long days (and nights), the Sundays, holidays, and vacations spent on the work, frequently without much encouragement or material aids. After the fundamental work is well on its way and the new ideas have been amply demonstrated, Government agencies or industrial firms will carry out the development work. The history of science gives numerous examples of the above. The early work in electricity, in organic chemistry, and in physical chemistry can be cited, for these, despite their present large-scale industrial use, began in the academic scientific laboratories.

This kind of work has in the past produced results that have changed the entire course of history. Examples of this are the discovery of electromag-

Digitized by Google

netism, the vacuum tube, and the synthesis of ammonia and of indigo. On the other hand, the work of any one particular man may not result in such world-startling discoveries; it may only add a small but valuable amount to the sum of human knowledge. It is impossible to predict the value of the fundamental research of any one man. We do know that in general it is this work that is the fountainhead of new developments. How soon or how long any particular piece of original and fundamental research will produce results that can be directly or indirectly of military value cannot be stated. The undisputed fact is that the more of this kind of work in progress the greater chance there is of new weapons.

The national cost of fundamental research in men and materials is relatively insignificant. There are only a relatively small number of scientists engaged in this work (a few hundred) and their requirements in the way of equipment and help, when considered on a national scale are relatively insignificant. However, at the present time it is not sufficient to take a point of view that we can "let" them work. Letting at this time must be a positive and not a negative action. It must mean that such scientists and their students be not required for other duties such as military service or civilian defense. Their income must continue. They must have help and funds for securing materials. They must be provided with assistance and technical aids. In other words, funds, priorities, and draft deferments have to be considered as part of the word "let." The assignment of priorities for research materials shows that this is recognized by the Government. It is, of course, also important that the institutions in which this work is in progress should not consider it as an unessential academic exercise or an extra burden on the overhead account.

At the time, several years ago, when our Government first recognized that our entry into the war was unavoidable, it was natural to take the point of view (and this was done by some of our military people) that the research that would be used or needed in this war was all done and that the war would be fought with what we had. They thought the same about steel capacity and the designs of tanks and planes. As the military leaders cannot predict the length of the war, the time available for research to aid in it is also unpredictable. If the war is short, there is no need of disturbing or changing the present fundamental research program. If it be long, then there is a vital need for both continuing it and augmenting it in the near future. No one can tell from what laboratory will come new and important discoveries. We are certain, however, that the more fundamental and original research done the greater the chance of the discoveries. The only way not to have the discoveries would be to close the laboratories. We may be in vital need of new discoveries. Without them we shall be placed in the position of giving the enemy the initiative and following his discoveries with a time disadvantage.

Scientific advancements made during the war may be very important. The development of the synthesis of ammonia in Germany in World War No. 1 caused the blockade to be much less effective than the military leaders of the Allies figured, because Germany was then not dependent upon Chile saltpeter for its explosives. It is the new discoveries made now or in the near future that may shape the course of victory.

To be unduly critical of any one particular fundamental research project as impractical or of only theoretical interest and therefore not significant for the war effort at this time is highly unsound reasoning. How can anyone tell in advance to what extent or how soon it can be put into practice. What is highly theoretical today is put into large-scale practice tomorrow.

One cannot determine the value of research to the war effort by whether or not it is fostered or financed by a Government agency. Government agencies support and develop discoveries once they are made, and they also direct this development toward ends of military value. New ideas and discoveries, however, are most likely to spring up in laboratories devoted to original research, and it is these new discoveries that can then be taken by the Government agencies for development. In fact, those discoveries made in the recent past in chemistry that are having the most significance at present in the war effort were not made in Government-sponsored laboratories. Some of these in their beginning stages would not have been financially aided by any Government agency or industrial firm, as they differed greatly from commonly accepted practice. In its inability to know just which laboratory, working on original work, will produce the most vital results for the war, science is not much different from the military. The high command cannot tell in advance just where the most important battles will take place. Many garrisons and bases will be unused. Many divisions and

Digitized by Google

material will not see action. We cannot in advance, however, say that these divisions are unnecessary.

Fundamental and original scientific research is, therefore, not only of great value for the war effort, but its continuance may be vital for victory. It is not an activity of secondary value for such things as morale or the selling of bonds, regardless of the values of these activities. Its products may have a direct bearing on killing the enemy and certainly will have, if the war lasts for years. How to continue it under present difficulties and restrictions is a matter for serious consideration. In this connection the following suggestions are made:

(1) Scientists of recognized tendencies toward original work and of proven accomplishments in fundamental research should be encouraged to continue. They should not be taken for what may be more emotionally satisfactory work on a development project under a Government contract.

(2) Priorities and draft deferments should be provided.

(3) Funds will be needed; but these should be free from the requirements of extensive reports and outlines of procedures in advance, such as are now required in most Government and industrial work.

(4) The work should not be directed by some committee chairman. Committee chairmen cannot be familiar with the work—otherwise they would be doing it.

(5) The funds should not be dependent upon the individual scientist's political connections or his ability to get elected or appointed to committees or society offices.

(6) Students should be permitted and encouraged to enter fundamental scientific work. A great deal of this kind of work has been done in the past by students under the direction of a professor interested in fundamental research. At the present time there is danger of encouraging students to enter the so-called more practical lines of work. General Hershey in his statement regarding the deferment of graduate students considers only those assisting in instruction and those working on a sponsored war project as eligible for deferment. Research on fundamental and original scientific problems should be placed in the same category as the work sponsored by Government agencies as its chance of direct value in the war is at least as great.

(7) In order to insure that the scientist engaged on original and fundamental research can direct his thoughts along lines such that his creative ideas will have the best chance of being of immediate military value, he should be made familiar with the problems, materials, and techniques of military importance that are related to his branch of science. This can be done without confining him to work on any particular project and without danger of loss of confidential and secret subject matter. The scientists of this country realize full well that our defeat will mean that they, each and every one, will be executed shortly thereafter. They have the knowledge of what has happened to their colleagues in the occupied countries of Europe. They are very anxious to help so that this will not happen here.

The day that fundamental and original scientific research stopped in Germany was the day that Germany began losing the war. This will be true provided that we do not stop our fundamental scientific research. We are in great danger of doing this at this time, with our scientists being taken for development projects and other activities. If the war is a long one, we will greatly regret the loss of the scientist and his students doing original work.

MAY 24, 1943.

Prof. J. H. SIMONS,
State College, Pa.

DEAR PROFESSOR SIMONS: This will express my warm appreciation for your fine letter of May 10 concerning the science mobilization bill, S. 702. The constructive comments and recommendations will be given full consideration by our committee, and I would certainly welcome any further assistance you may care to offer in connection with the proposed bill.

I should like to repeat a sentence of your article, Research in Wartime, with which I am in full accord. "The day that fundamental and original scientific research stopped in Germany was the day that Germany began losing the war."

We all know that just as the war has redirected all phases of the national activity, it has also disrupted the progress of fundamental research. The col-

Digitized by Google

lege, university, and foundation programs which normally carry the bulk of this type of research have not only had their programs curtailed but, I believe, may be unable to resume them after the war unless considerable aid is forthcoming from the Government. Such Government subsidies to the outside groups, unlike subsidies granted by industry, should make no demands and should in no way interfere with the process of free inquiry. It is the clear intent of the authors of the bill that fundamental research not only be extended and encouraged but that it not be shackled by restrictions of any kind. This is in accordance with the principle that science operate in the interest of the public. This interest, I believe, is best served by a completely free and unrestrained science.

Adequate Governmental encouragement of scientific and technical activities is long overdue in this country, and I invite the active participation of competent scientists in formulating an appropriate program.

Sincerely,

H. M. KILGORE, *United States Senator.*

STANDOLIND OIL & GAS CO.,
Tulsa, Okla., June 23, 1943.

Senator KILGORE,
Washington, D. C.

DEAR SENATOR: I have before me a copy of Senate bill 702, introduced by you and said to have been referred to the Committee on Military Affairs. Reading beyond the high-sounding phrases under declaration of policy, I find a bill which, whether by design or not, sets up another super Federal establishment with the most arbitrary and despotic powers over the destiny and functions of industry and all workers from the keenest scientist to the laboratory janitor, and this in a country which is fighting a desperate war to destroy totalitarianism and to preserve the very freedoms which this bill could so easily make a mockery.

Has it not by chance occurred to you that the very genius and success of our industry and science in the past has been due in large measure to our system of free enterprise and competitive effort? That the failure to employ to the fullest the possibilities of invention and scientific discoveries lies not so much at the door of unplanned effort as at the door of the tradition-bound Army-Navy "brass hats" and their counterpart, the political-minded, power-lusting, and narrow-minded Federal bureaucrats?

Rather than to add another superautocratic bureau, would it not be better to make an honest effort to cut out the dead wood, simplify, consolidate, and make more efficient and intelligent the function of the many existing Federal agencies? The Bureau of Standards, the Bureau of Mines, Office of Scientific Research, National Roster of Scientific and Specialized Personnel, and the National Research Council, among many others, completely cover the fields proposed by this bill.

As an American citizen and scientist, I respectfully ask that you advise me why and for what reasons you believe this bill is advisable and necessary, especially in peacetime.

I have written the Representatives to Congress from Oklahoma protesting the passage of this bill, and I am sending copy of this letter to the chairman of the Senate Committee on Military Affairs.

Yours very truly,

R. J. RIGGS.

EXHIBIT No. 67

JULY 21, 1943.

Mr. R. J. RIGGS,
Stanolind Oil and Gas Co.,
Philcade Building, Tulsa, Okla.

DEAR MR. RIGGS: This will acknowledge your letter of June 23, regarding the science mobilization bill, S. 702.

I regret that you see certain adverse implications in this proposed legislation. It is my intention to find a way to aid scientific and technical men to make a maximum contribution to the conduct of the war and in coping with post-war problems of the transitional period.

Digitized by Google

Your protest will be placed before the subcommittee currently studying this bill, but should you care to examine the testimony that continues to impress me with the importance of this bill for the Nation, I shall be glad to send you copies of our public hearings on the measure.

Very sincerely yours,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 68

HARVARD UNIVERSITY,
Cambridge, Mass., April 26, 1943.

Senator H. M. KILGORE,
Committee on Military Affairs,
United States Senate, Washington, D. C.

MY DEAR SENATOR KILGORE: Many thanks indeed for the copy of the science mobilization bill, S. 702, and for your abstract of its salient features. I have read them both and had a good deal of discussion of them with my colleagues here in the Harvard Psychological Laboratory.

The bill seems to me to be correct in its intentions and general provisions, very important, and a measure that ought to pass. I hope very much that you can be rewarded for your pains and effort in its behalf by success in both Houses.

There can be no doubt that the emergency has revealed the practical importance of science to Government and social warfare, and that the emergency which will inevitably follow the peace should be no less dependent upon the utilization of scientific knowledge and facilities. We must not forget that a successful peace and readjustment will be achieved, not in a single stroke, but only by eternal vigilance, and, in what I hope will be the continuous effort of the Government to improve social weal after the war, the results of research and the methods of research ought to be used as fully as they are now under the Office of Scientific Research and Development.

The passage of the bill might dislocate the Office of Scientific Research and Development, which is doing a splendid work at present, both on the side of the Committee for Medical Research and the National Defense Research Committee. I hope it will not do that, but will simply enlarge the scope of this work and contribute to the efficiency of the lines of research that are already in progress. I did not find in what you had to say that you realized fully what the Office of Scientific Research and Development is doing, but I think you do if I may judge from other reports of your work which I have read.

With best wishes for the success of this bill, I am,

Cordially yours,

EDWIN G. BORING,
Director of the Psychological Laboratory.

EXHIBIT No. 69

MAY 21, 1943.

MR. EDWIN C. BORING,
Director, Psychological Laboratory,
Emerson Hall, Harvard University, Cambridge, Mass.

MY DEAR MR. BORING: Thank you for your fine letter of April 26 in support of the science mobilization bill.

We are indeed conscious of the work of the Office of Scientific Research and Development, which is doing one of the finest jobs in the field today. I assure you that the bill is designed to strengthen the hand of effective research everywhere and to coordinate the work of all existing research agencies. It would not interfere with existing organizations.

I hope you will give this measure your active support to insure its early passage.

Very sincerely yours,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 70

NATIONAL CIVIL SERVICE REFORM LEAGUE,
New York, N. Y. April 30, 1943.

Hon. H. M. KILGORE,
United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: I have read with much interest your bill S. 702 to mobilize the scientific and technical resources of the Nation, and to establish an Office of Scientific and Technical Mobilization. I believe the legislation is both necessary and desirable and hope that it will receive favorable consideration by the Congress.

I have been impressed with the potentialities of the presently operating National Roster of Scientific and Technical Personnel now under the jurisdiction of the War Manpower Commission. It has proved a useful and valuable means of supplementing recruiting for the Government service, particularly for high professional and scientific services. Your plan is far more comprehensive and has great potentialities, both war and peacetime.

May I take this opportunity to make one suggestion, which I hope will commend itself to you? On page 6, lines 16 to 19 of the bill authority is given to the administrator to waive requirements of the civil service act and rules when he deems it necessary to do so. I appreciate the purpose you have in mind, but I wonder if it is wise to give the administrator such sweeping and unlimited authorization. Frankly, I believe the proviso is unnecessary for under the civil service act and rules the President and the Civil Service Commission could, in proper cases, waive requirements of the civil-service law and rules upon the recommendation of the administrator. It seems to me that this would be preferable to placing the authority exclusively in the hands of the administrator. There is no good reason for giving him this broad authority which is withheld from all other appointing authorities. I believe that you will agree with me that it is unwise to grant special exceptions of this character which accomplish no really useful purpose and establish unwise precedents.

The broad authority and responsibility which your proposal places in the hands of the administrator makes it all the more imperative that the selection of his subordinates be safeguarded against any possible suspicion of partisanship. I believe the elimination of the proviso in lines 16 to 19 would avoid any misunderstanding and still not prevent waiving of the civil service requirements in special cases where deemed proper by the Civil Service Commission.

With best wishes,

Sincerely yours,

H. ELIOT KAPLAN, *Executive Secretary.*

EXHIBIT No. 71

OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT,
Washington, D. C., December 7, 1942.

Hon. HARLEY M. KILGORE,
Chairman, Subcommittee on Technological Mobilization,
United States Senate, Washington, D. C.

MY DEAR SENATOR: Mr. Gordon has kept me posted in regard to the progress of your study of technological mobilization, in which, of course, I am exceedingly interested. For some reason your letter of December 1 did not reach me until this morning, but, on the basis of Mr. Gordon's report to me of his conference with you of a few days ago, I had already drafted some material, so that I am enabled to write a reply rather promptly in accordance with your last statement that you wish to have comments within a few days. I hope and trust that the delay in reply since the date of your letter will not in any way be inconvenient to you.

The whole problem of technological mobilization for modern war is one of extreme breadth and difficulty. For 2½ years now I have been deeply immersed, not only in carrying on one aspect of this matter, but in a deep study of the appropriate organizational means by which it can be best furthered. The conduct of modern war depends in no small degree upon the skill and effectiveness with which science and technology are brought to bear. In fact, the entire course of events may be seriously affected by the question of whether our weapons are

Digitized by Google

fully equal to those of the enemy, and this in turn depends upon a large number of steps. We need to utilize the inventiveness of our people, we need to bring to bear the best scientific and engineering skill, we need to manufacture effectively and promptly, and we need training programs that are adequate so that the resulting tools can be effectively and fully used. It is a fascinating and exceedingly important aspect of the entire war effort. I know of no aspect of our national effort that more clearly warrants all of the careful consideration that can be brought to bear upon it. Accordingly, I have followed your studies with the deepest interest.

Yet as I read the first draft of the bill which has been under discussion, S. 2721, I immediately feel that it is based upon inaccurate premises. The first two sections seem to me to be founded upon some feeling that we are far behind the enemy, that there are serious bottlenecks in our technical effort, and that in general we have a serious situation upon our hands which warrants radical changes. I cannot by any means, of course, urge that the present situation is not capable of being improved, but I am very far from subscribing to this preamble.

The prosecution of war research involves many phases. I think that it will clarify my comments upon this bill if I outline some of these phases and the way in which they are now provided for under the present governmental organization.

First, there is the definite job of research and development upon new and secret weapons. This, I feel, is the most important aspect of the whole affair. The responsibility for this piece of work is lodged in the Office of Scientific Research and Development. Together with its predecessor, the National Defense Research Committee, it has now had 2½ years of experience in close collaboration with the Army and the Navy in this effort. I append a document which outlines the way in which this organization is put together, the nature of its internal relationships, the contracts which it has under way, and similar data. The point which I wish to emphasize here, however, is that this particular section of the work is unique in several ways. First, it involves cooperating with both the Army and the Navy, and in servicing both it ties together their interests at innumerable points. Second, its work is by its very nature highly secret, and it hence needs to be carried on under the closest organizational control and in very close interrelationship with the armed services. Third, it needs for its furtherance the aid of the outstanding scientists and technical men of the country, the services of the best laboratories that can be found, and every organizational aid which will make it possible to work rapidly and flexibly. In view of the experience to date, I feel that the Office of Scientific Research and Development has all of these things, and that under its organizational form it is well adapted for the purpose in hand.

The real answer, of course, as to whether it is adapted to its purpose or not should be given by naming the results that it has accomplished. The last time that I appeared before the Appropriations Committees of the House and Senate I presented letters from the Secretary of War and the Secretary of the Navy which made definite statements in this regard. I feel that the statements as to accomplishments of this Office should always come from those that we service, namely, the Army and Navy. Every meeting in Office of Scientific Research and Development, concerned with new weapons, joins civilian scientists and technologists with military men; in the sections where officers, who are specialists, join in originating and guiding projects, in National Defense Research Committee where Major General Williams and Captain Smith are members, and in the council. The armed services take over when a device arrives at the point of production and use. Something over a hundred projects have thus produced devices or processes which have been adopted for use in the Army or Navy. They hence know well the record which Office of Scientific Research and Development has thus far established.

It is true that the National Defense Research Committee is charged by the President with research and development on instrumentalities of war, but there is one exception. The National Advisory Committee for Aeronautics has been in existence for over 25 years. It was established for the purpose of improving our knowledge of the problems of flight. Through the long years of peace it labored to advance the science of aeronautics and its application to the construction of better aircraft. It is a very fortunate thing that the Congress established and continued to support this agency, for upon its efforts rest in no inconsiderable degree the fact that the United States was not found lacking when it came time to apply its aeronautical knowledge in combat. The National Advisory Committee for Aeronautics is made up of military and civilian mem-

Digitized by Google

bers, who serve without compensation. It operates extensive laboratories. It works in very close collaboration with the Army Air Force and the Bureau of Aeronautics. It deserves and receives the interest and support of Congress in its undertakings. Evidently, when Office of Scientific Research and Development was formed there was no justification for duplicating the work done by this excellent agency. Accordingly, research on the problems of flight, as covered by the National Advisory Committee for Aeronautics, has been left to that organization. Appropriate interchange between these agencies has, however, been readily accomplished. Dr. Hunsaker, Chairman of the National Advisory Committee for Aeronautics, is a member of the Council of Office of Scientific Research and Development. The Director of Office of Scientific Research and Development is a member of the National Advisory Committee for Aeronautics. There is no lost motion as between these two groups, and no formal organizational integration is needed in order to further their efforts.

At the same time that National Defense Research Committee was formed, in June 1940, the National Inventors Council was also formed in the Department of Commerce. This agency reviews suggestions coming from the public. It receives a very large number, indeed, of suggestions that pertain to the war effort, and examines into these by means of committees of competent scientific standing. Those that are found worthy of military attention are brought to the appropriate group in either the Army or the Navy. In the case of a suggestion, received in this manner, which proves to be sound and of interest, if further development is warranted, this is readily provided for by reason of a request from one of the armed services to Office of Scientific Research and Development, which has funds and organization for the purpose of investigating any such suggestion as may appear likely to lead to a valuable result. The National Inventors Council performs a very needed function in thus examining into very many suggestions. Many of these, of course, are duplicates. Many also are prepared by individuals who cannot realize the actual conditions of practice. Unfortunately also, there are many suggestions received in this way, sometimes from highly enthusiastic individuals, which prove on careful unbiased examination to be impractical. There are also many suggestions received of possible devices where active development of devices of just that sort is already under way. It would be pleasant in such cases to be able to inform the inventor that his suggestion is already embodied in a device which is already well on its way toward practical use. In general, however, this obviously cannot be done, for it is usually impossible to thus advise an inventor on a particular point without divulging a considerable section of secret information. However, it is my opinion that ideas of real merit which reach the Inventors Council are carefully reviewed, and that the cases in which worth-while ideas are not appreciated or are overlooked are very few indeed. Moreover, the means for proceeding with valuable ideas is now present, either by reason of action on the part of the armed services themselves, or by reference to Office of Scientific Research and Development by the services with a request for development. I believe that the Inventors Council can best operate as it is; namely, as a part of the Department of Commerce organization, for it has close association with the Patent Office, which is desirable, without, of course, in any way impairing the care with which the Patent Office maintains the secrecy concerning ideas which are committeed to its charge in patent applications.

In examining into the structure thus far outlined, it is evident that there is a definite gap. In times of peace there is an enormous amount of industrial research carried on in this country in connection with the problems of industry. In time of war, much of this research becomes diverted to solve the problems of strategic and substitute materials and processes, and other problems incident to the adaptation of our industrial machinery to war production. This phase of research, especially on substitute materials, is indeed important. Under the Executive order of the Office of Scientific Research and Development the President charged the Director with the general duty of coordinating all research in connection with the war effort. Accordingly, under this direction, I immediately studied into this problem. I found that the War Production Board, in certain areas, was actively engaged in the correlation of this type of research, and its direction along lines of the war effort. This was being done notably in the case of certain problems of strategic minerals and metals. In these the War Production Board had secured the advice and counsel of the National Academy of Sciences and the National Research Council. In my opinion the relationship was correct, and capable of accomplishing very useful results. However, I had the strong feeling that work in this area

Digitized by Google

needed extension. I accordingly recommended to the War Production Board that they organize this phase of their effort more centrally, and that they extend their work on research on strategic and substitute materials and processes. This they have recently done by the creation of an Office of Production Research and Development under the directorship of Dr. Harvey N. Davis. In my opinion this Office has an excellent opportunity to accomplish much in those fields of research which are more definitely along industrial lines, and not concerned with weapons which are secret, and I have great confidence that Dr. Davis, who has just started on his effort, will produce results. I have never felt, and I do not now feel, that this phase of the research effort should be located in the Office of Scientific Research and Development. On the contrary, I have felt that it could best be carried on in the War Production Board organization which already has the necessarily close contacts with industry and with industrial problems. To place it in the Office of Scientific Research and Development would involve duplication of facilities. Moreover, the work is of a very different nature and it would be exceedingly difficult to combine in the same organization the rigid arrangements that are necessary for the secure handling of secret matters concerned with new weapons and the development of new industrial processes, where facile interchange between industrial units having the same types of problems is an essential element.

While Dr. Davis is only well started in his work in War Production Board, it is evident that close interrelation with Office of Scientific Research and Development is in order, to avoid duplication, and to render the results of one organization available to the other, when applicable, and this will be established. There will also be a flow of ideas which reach the Inventors Council, and which are industrial in application, to the new organization in War Production Board. On the other hand, Dr. Davis will not need the close liaison with the armed services at every point, which is essential in the work of Office of Scientific Research and Development. I do not wish to speak for Dr. Davis, who is quite able to speak for himself, but these are points in his general plan as I understand it.

There is one further phase of research concerned with the war effort; namely, medical research. This, needless to say, is of exceedingly great importance in many ways. The safety of our soldiers and sailors, especially in tropical regions, and under the stress of air action, depends in no small degree upon the efficiency of our medical units in the Army and Navy, and upon the aid which they can be given in their problems by civilian medical research scientists. By order of the President, research on military medical matters is centered in the Office of Scientific Research and Development, where it comes under a committee on medical research headed by Dr. A. Newton Richards. This committee leans heavily upon committees of the National Research Council for aid and advice and works very closely with the Surgeons General of the Army and Navy. There is another phase of medical research, equally important, concerned with the whole broad subject of the public health. This is, as it has been for many years, centered in the Public Health Service, which is now a part of the Federal Security Agency. There is very close interchange indeed between Dr. Richards and Dr. Parran, the Surgeon General of the Public Health Service, and a member of Dr. Parran's research staff sits on the committee on medical research. This provides for a proper interchange of results, where these are of interest in both phases of the general problem, and it also provides against unwarranted duplication of effort.

In addition, of course, there are various departments of government which carry on research which is closely connected with the war effort. Notable are the Department of Agriculture and the Bureau of Mines, to name two among many. The Office of Scientific Research and Development is enabled under its Executive order to call upon these groups for aid on particular problems, and it has done so, notably in the case of the Bureau of Standards.

The National Academy of Sciences remains, as it has been since the time of the Civil War, the agency charged in its congressional charter with the duty of advising Federal agencies in regard to their scientific problems. Dr. F. B. Jewett, president of the academy, has stated its functions to you in his testimony, and I will not enlarge upon it. The academy and its organization, the National Research Council, are called upon in this capacity by the Office of Scientific Research and Development as well as many other Government agencies. Undoubtedly Dr. Davis and his Office of Production Research and Development in War Production Board will lean heavily for advice upon the academy.

It may be well to summarize the course of an idea. Invention, the first suggestions that lead to new military devices, arise in many places. Since a full grasp of actual needs and a keen realization of the practical conditions of combat is a prime criterion in any new device, the origin of an idea is most likely

Digitized by Google

to arise in the mind of some individual in the armed services who is faced with the problem needing solution in a very forceful way. It may also arise in the mind of a scientific man closely associated with military activities. By comparison, the independent inventor is not nearly as likely to produce useful suggestions on strictly military matters, although it sometimes occurs. However, the individual inventor, in civil life, is much more likely to produce ideas which are applicable to industrial processes. When such an idea is received by the Inventors Council it is first reviewed by scientific groups. If it is in the field of aviation, it is then referred, if of apparent importance, to National Advisory Committee for Aeronautics. If it is of industrial nature, it will go to Dr. Davis' organization. If it applies to a new weapon, it becomes studied in the Army and Navy. It is usually a long way from the basic idea to its practical utilization. In all three instances above, however, there is provided means by which such an idea may be developed, along with the ideas that arise within the organization itself. Moreover, the Army and Navy have not only their own research and development organizations for this purpose, but also the aid of the Office of Scientific Research and Development on call. It is also possible to turn to the research facilities in one of the regular Government departments for aid. Throughout this procedure the scientific advice of the academy is available if needed. There thus seems to me to be available at the present time a fully operative procedure for carrying an idea through from its inception to its actual use. The one gap has been, until recently, in the field now covered by War Production Board and when Dr. Davis' organization gets fully under way this gap will be closed.

I believe that this gives the present range of the technological effort in connection with the prosecution of the war. The principal question that immediately arises is whether a reorganization of this effort is necessary for its best functioning. My personal opinion is that no such reorganization is at present called for. There are undoubtedly many places where procedures and relationships can be improved in detail. However, a sweeping change that would place all technological effort under one head is not, in my opinion, desirable. Such a step is needed only where interests conflict and duplication occurs, where there is not proper liaison, and where there is overlapping of effort. None of this situation, in my opinion, obtains in regard to the technological effort at the present time. There is the closest of coordination, relationships are cordial throughout, and duplication is avoided. Moreover, each organization has its own clearly defined unique job and is carrying it on energetically.

There are many things that I could urge. I could urge, for example, that all support possible be given to the effort of Dr. Davis in connection with his new office in War Production Board, for I think it is a difficult job, but one which is full of possibilities. However, they are not points raised in your letter or in your bill. I would be very happy to discuss them with you at any time, but I do not believe that you wish me to go into them in this letter.

My summary of the situation, then, is as follows: I believe that the technological effort of this country is of exceedingly great importance, and I am glad to see it studied into thoroughly, and I hope that it will be studied into many times as our war effort proceeds, in order that it may be kept keenly alive to its opportunities and in order that any malfunctioning may be corrected. However, I do not believe that a bill that would join the various research and development agencies is now needed. On the contrary, I believe that the confusion which it would cause and the delays incident to the reorganization of effort which it would enforce would far offset any benefit which might come out of it.

Cordially yours,

V. BUSH, *Director.*

EXHIBIT No. 72

DECEMBER 4, 1942.

THE OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT AND RELATED ORGANIZATIONS

Prepared by F. S. Gordon

The Office of Scientific Research and Development was established on June 28, 1941, by Executive Order No. 8807. The Executive order provides that Office of

Digitized by Google

Scientific Research and Development shall be headed by a Director appointed by the President (Dr. Vannevar Bush), who shall be advised and assisted in the performance of his duties by an advisory council. Office of Scientific Research and Development was given the following two main functions: (1) The initiation and support of scientific research on the mechanisms and devices of warfare and (2) the initiation and support of scientific research on medical problems affecting the national defense. The National Defense Research Committee (which had been created on June 27, 1940, by an order of the Council for National Defense approved by the President) was continued in existence and charged with the duties and advising and assisting the Director of Office of Scientific Research and Development in the performance of his duties in the field of instrumentalities of warfare, and the Committee on Medical Research was established to advise and assist the Director of Office of Scientific Research and Development in the performance of his duties in the field of medical research.

THE OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT ADVISORY COUNCIL

The Office of Scientific Research and Development Advisory Council is composed of the following members:

1. The Director of Office of Scientific Research and Development as chairman;
2. The Chairman of the National Advisory Committee for Aeronautics (J. C. Hunsaker);
3. The Chairman of National Defense Research Committee (James B. Conant);
4. The Chairman of the Committee on Medical Research (A. N. Richards);
5. An Army representative designated by the Secretary of War (H. H. Bundy); and
6. A Navy representative designated by the Secretary of the Navy (Rear Admiral J. A. Furer).

The new Director of the Office of Production Research and Development, of War Production Board, Dr. Harvey N. Davis, met with the Council at the last meeting, immediately after his appointment.

By reason of a special letter from the President, Dr. F. B. Jewett, president of the National Academy of Sciences, advises the Director of Office of Scientific Research and Development and often meets with the Council.

It is through the Office of Scientific Research and Development Advisory Council that the broad questions of policy affecting Office of Scientific Research and Development are determined. Composed as it is of representatives of all organizations principally interested in war research for the United States Government, the members of the Advisory Council are uniquely equipped to advise on the overall aspects of war research.

THE NATIONAL DEFENSE RESEARCH COMMITTEE

It is the duty of National Defense Research Committee to implement in the field of war weapons the broad decisions of policy made by Dr. Bush with the advice and assistance of the other members of the Advisory Council. In order to work effectively, the National Defense Research Committee organization is broken down into divisions and the divisions in turn are subdivided into sections, each of which concentrates on work in a very specialized field of research. These sections originate most of the specific proposals for the placing of contracts with nongovernmental organizations (universities and business organizations having research facilities). Here also at this operating level there is the closest cooperation with the armed services in order to insure that practical aspects of the problems are given the necessary consideration. The Army and Navy have representatives assigned to each section of National Defense Research Committee, and nearly all proposals for specific contracts are initiated by the sections in consultation with such representatives of the armed services. Most of these proposals have their first attention by reason of a direct request for aid from one of the armed services. However, in accordance with the President's orders requests from the United Nations are also acted upon. The contract proposals flow from the National Defense Research Committee sections to the National Defense Research Committee divisions and, if approved by the particular National Defense Research Committee division, are then considered by the members of National Defense Research Committee at one of the regular meetings.

Digitized by Google

Representatives of the Army and Navy, appointed by the Secretary of War and Secretary of the Navy, respectively, are members of the National Defense Research Committee and thus are in a position to review all specific contract proposals and to determine whether or not the emphasis desired by the armed services is being achieved. If at the National Defense Research Committee meeting it is decided that a proposed contract should be negotiated, the members of National Defense Research Committee make such a recommendation to Dr. Bush, the Director of Office of Scientific Research and Development, who decides in the final instance whether or not such a contract shall be executed.

Some of the requests for development received from the Army and Navy arise because of ideas which originate as suggestions by individuals which are reviewed by the National Inventors Council, and thus brought to the attention of the services. Hon. Conway P. Coe, Commissioner of Patents, is a member of National Defense Research Committee, and thus furnishes direct contact with the National Inventors Council.

The internal set-up of National Defense Research Committee is now in the process of reorganization. At the present time there are (i) four divisions of National Defense Research Committee and (ii) some special committees (including the group at the National Research Council of the National Academy of Sciences working on metallurgical problems) reporting directly to the Chairman of National Defense Research Committee. The proposed reorganization (which should be put into effect within the next month) contemplates a greater degree of specialization by the establishment of approximately 18 operating divisions of the National Defense Research Committee (one such division will specialize in metallurgical problems). Some of these divisions will in turn be broken down into sections which will specialize in research work on war weapons in a very limited field. Subsequent to this reorganization as well as at the present time, the flow of recommendations will be from (i) National Defense Research Committee sections to (ii) National Defense Research Committee divisions to (iii) the members of National Defense Research Committee, who in turn will make recommendations to Dr. Bush, enabling him to decide which contracts should be executed. After approval, all the business aspects of contracts are handled by the executive secretary, Dr. Irvin Stewart, under whom operates the administrative office concerned with priorities, personnel, accounts, etc.

Subsequent to the execution of contracts with nongovernmental educational institutions and business organizations, the representatives of the particular National Defense Research Committee section where the project originated have the duty of supervising the performance of the research investigations by the contractors as far as their technical and scientific aspects are concerned. Such supervisory duties include the duty of making recommendations through the National Defense Research Committee division to the members of National Defense Research Committee, who in turn make recommendations which enable Dr. Bush to make the ultimate decision as to whether or not the work under particular contracts should be extended or terminated.

COMMITTEE ON MEDICAL RESEARCH

It is the duty of the Committee on Medical Research to implement in the field of medical research the broad decisions of policy made by Dr. Bush with the advice and assistance of the Office of Scientific Research and Development Advisory Council by handling the details of recommending and administering specific contracts with nongovernmental institutions (usually medical schools and medical research institutions). The Committee on Medical Research has utilized for operating purposes the various subcommittees of the Division of Medical Sciences of the National Research Council, which were already in existence at the time of the establishment of the Committee on Medical Research. These subcommittees perform in the field of medical research functions analogous to those performed by the National Defense Research Committee sections and divisions in the field of research on war weapons. Specific contract proposals originating with research organizations are reviewed by these subcommittees, and recommendations are made to the Committee on Medical Research. As at all other levels in the Office of Scientific Research and Development hierarchy, the Army and Navy are represented on the Committee on Medical Research, as is the Federal Security Agency. The representatives of the War and Navy Departments and of the Federal Security Agency on the Committee on Medical Research

Digitized by Google

are selected by the Secretaries of War and Navy and the Federal Security Administrator from the staffs of the Surgeons General of the Army, Navy, and the Public Health Service respectively. Thus, it is possible for the governmental institutions primarily interested in war medical research to examine each specific contract proposal and make recommendations thereon before its adoption. If the members of the Committee on Medical Research react favorably to a proposal, the Committee on Medical Research recommends to Dr. Bush that a contract be negotiated, and on the basis of this recommendation Dr. Bush decides whether or not a contract should be executed.

The contractors' research work under Office of Scientific Research and Development contracts recommended by Committee on Medical Research is supervised by a technical staff serving the Committee on Medical Research and by representatives of the subcommittees of the Committee on Medical Research which considered the particular project. These subcommittee members have the duty of recommending to the Committee on Medical Research whether the work under the contract should be extended or terminated, and the Committee on Medical Research in turn makes a recommendation to Dr. Bush to enable him to make the final determination.

RELATIONSHIP OF THE OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT TO NATIONAL ACADEMY OF SCIENCE AND THE NATIONAL RESEARCH COUNCIL

The above description of the Office of Scientific Research and Development organization indicates that the Office of Scientific Research and Development has utilized the services of the National Academy of Sciences and the National Research Council in several instances. Specifically, the present relationship can be summarized as follows:

(1) In the National Defense Research Committee field (war weapons), (a) the metallurgical work is now being supervised by a National Research Council committee, and in the pending reorganization this metallurgical work will be centralized in one of the contemplated 18 divisions of the National Defense Research Committee; the new division will be headed by the Chairman of the War Metallurgy Committee of the National Research Council and will work closely with that committee.

(b) Problems in the selection and training of service personnel are reviewed and recommendations made to the National Defense Research Committee by a committee of the National Research Council.

(2) In the Committee on Medical Research field (medical research), various subcommittees of the Division of Medical Sciences of the National Research Council have been acting in advisory capacities;

(3) The Office of Scientific Research and Development has executed several contracts whereby the National Academy of Sciences has agreed to conduct certain necessary experimental studies and investigations in the field of war weapons; and

(4) Under congressional authorization, the Office of Scientific Research and Development has transferred funds directly to the National Academy of Sciences. For example, the First Supplemental National Defense Appropriation Act, 1943, authorized the Office of Scientific Research and Development to transfer $113,790 to the National Academy of Sciences to defray certain administrative and overhead expenses incurred in carrying out research projects for Federal agencies during the fiscal year 1943.

SPECIAL SECTIONS OF THE OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT

In addition to projects handled through regular National Defense Research Committee and Committee on Medical Research channels, from time to time the armed services call upon the Office of Scientific Research and Development to handle special projects which are administered by separate sections set up for that purpose directly under the supervision of Dr. Bush. These special projects are generally financed by means of funds which are transferred to the Office of Scientific Research and Development by either the Army or the Navy (depending upon which is interested).

EXECUTIVE ORDER

ESTABLISHING THE OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT IN THE EXECUTIVE OFFICE OF THE PRESIDENT AND DEFINING ITS FUNCTIONS AND DUTIES

By virtue of the authority vested in me by the Constitution and the statutes of the United States, and in order to define further the functions and duties of the Office for Emergency Management with respect to the unlimited national emergency as declared by the President on May 27, 1941, for the purpose of assuring adequate provision for research on scientific and medical problems relating to the national defense, it is hereby ordered:

1. There shall be within the Office for Emergency Management of the Executive Office of the President the Office of Scientific Research and Development, at the head of which shall be a Director appointed by the President. The Director shall discharge and perform his responsibilities and duties under the direction and supervision of the President. The Director shall receive compensation at such

Digitized by Google

rate as the President shall determine and, in addition, shall be entitled to actual and necessary transportation, subsistence, and other expenses incidental to the performance of his duties.

2. Subject to such policies, regulations, and directions as the President may from time to time prescribe, and with such advice and assistance as may be necessary from the other departments and agencies of the Federal Government, the Office of Scientific Research and Development shall:

a. Advise the President with regard to the status of scientific and medical research relating to national defense and the measures necessary to assure continued and increasing progress in this field.

b. Serve as the center for the mobilization of the scientific personnel and resources of the Nation in order to assure maximum utilization of such personnel and resources in developing and applying the results of scientific research to defense purposes.

c. Coordinate, aid, and, where desirable, supplement the experimental and other scientific and medical research activities relating to national defense carried on by the Departments of War and Navy and other departments and agencies of the Federal Government.

d. Develop broad and coordinated plans for the conduct of scientific research in the defense program, in collaboration with representatives of the War and Navy Departments; review existing scientific research programs formulated by the Departments of War and Navy and other agencies of the Government, and advise them with respect to the relationship of their proposed activities to the total research program.

e. Initiate and support scientific research on the mechanisms and devices of warfare with the objective of creating, developing, and improving instrumentalities, methods, and materials required for national defense.

f. Initiate and support scientific research on medical problems affecting the national defense.

g. Initiate and support such scientific and medical research as may be requested by the government of any country whose defense the President deems vital to the defense of the United States under the terms of the Act of March 11, 1941, entitled "An Act Further to Promote the Defense of the United States"; and serve as the central liaison office for the conduct of such scientific and medical research for such countries.

h. Perform such other duties relating to scientific and medical research and development as the President may from time to time assign or delegate to it.

3. The Director may provide for the internal organization and management of the Office of Scientific Research and Development and may appoint such advisory committees as he finds necessary to the performance of his duties and responsibilities. The Director shall obtain the President's approval for the establishment of the principal subdivisions of the agency and the appointment of the heads thereof.

4. In carrying out its functions, the Office of Scientific Research and Development shall utilize the laboratories, equipment, and services of governmental agencies and institutions to the extent that such facilities are available for such purposes. Within the limits of funds appropriated or allocated for purposes encompassed by this Order, the Director may contract with and transfer funds to existing governmental agencies and institutions, and may enter into contracts and agreements with individuals, educational and scientific institutions (including the National Academy of Sciences and the National Research Council), industrial organizations, and other agencies, for studies, experimental investigations, and reports.

5. The Director is authorized to take over and carry out the provisions of any contracts which fall within the scope of this Order heretofore entered into by (1) the National Defense Research Committee, established by order of the Council of National Defense on June 27, 1940, (2) the Health and Medical Committee, established by order of the Council of National Defense on September 19, 1940, and (3) the Federal Security Administrator in his capacity of Coordinator of Health, Medical Welfare, Nutrition, Recreation, and other related activities as authorized by order of the Council of National Defense on November 28, 1940. The Director is further authorized to assume any obligations or responsibilities which have heretofore been undertaken by the above agencies for and on behalf of the United States Government and which fall within the scope of this Order.

6. There is created within the Office of Scientific Research and Development an

Digitized by Google

advisory Council consisting of the Director as Chairman, the Chairman of the National Advisory Committee for Aeronautics, the Chairman of the National Defense Research Committee (hereinafter described), the Chairman of the Committee on Medical Research (hereinafter described), one representative of the Army to be designated by the Secretary of War, and one representative of the Navy to be designated by the Secretary of the Navy. The Council shall advise and assist the Director with respect to the coordination of research activities carried on by private and governmental research groups and shall facilitate the interchange of information and data between such groups and agencies.

7. There shall be within the Office of Scientific Research and Development a National Defense Research Committee consisting of a chairman and three other members appointed by the President, and in addition the President of the National Academy of Sciences, the Commissioner of Patents, one officer of the Army to be designated by the Secretary of War, one officer of the Navy to be designated by the Secretary of the Navy, and such other members as the President may subsequently appoint. The National Defense Research Committee shall advise and assist the Director in the performance of his scientific research duties with special reference to the mobilization of the scientific personnel and resources of the Nation. To this end it shall be the responsibility of the Committee to recommend to the Director the need for and character of contracts to be entered into with universities, research institutes, and industrial laboratories for research and development on instrumentalities of warfare to supplement such research and development activities of the Departments of War and the Navy. Furthermore, the Committee shall from time to time make findings and submit recommendations to the Director with respect to the adequacy, progress, and results of research on scientific problems related to national defense.

8. There shall be within the Office of Scientific Research and Development a Committee on Medical Research consisting of a Chairman and three members to be appointed by the President, and three other members to be designated respectively by the Secretary of War, the Secretary of the Navy, and the Administrator of the Federal Security Agency. The members so designated by the Secretaries of War, and Navy, and Federal Security Administrator shall be selected from the respective staffs of the Surgeons General and the Surgeon General of the Public Health Service with particular reference to their qualifications in the field of medical research. The Committee on Medical Research shall advise and assist the Director in the performance of his medical research duties with special reference to the mobilization of medical and scientific personnel of the Nation. To this end, it shall be the responsibility of the Committee to recommend to the Director the need for the character of contracts to be entered into with universities, hospitals, and other agencies conducting medical research activities for research and development in the field of the medical sciences. Furthermore, the Committee shall from time to time, on request by the Director, make findings and submit recommendations with respect to the adequacy, progress, and results of research on medical problems related to national defense.

9. The members of the Advisory Council the National Defense Committee the Committee on Medical Research and such other committees and subcommittees as the Director may appoint with the approval of the President shall serve as such without compensation, but shall be entitled to necessary and actual transportation, subsistence, and other expenses incidental to the performance of their duties.

10. Within the limits of such funds as may be appropriated to the Office of Scientific Research and Development or as may be allocated to it by the President, the Director may employ necessary personnel and make provision for necessary supplies, facilities, and services. However, the Director shall use such statistical, informational, fiscal, personnel, and other general business services and facilities as may be made available to him through the Office for Emergency Management.

FRANKLIN D. ROOSEVELT.

THE WHITE HOUSE,
June 28, 1941.

EXHIBIT No. 74

DETROIT, MICH., *May 9, 1942.*

Hon. H. M. KILGORE,
Chairman, Subcommittee on Technological Mobilization,
Committee on Military Affairs, United States Senate,
Washington, D. C.

DEAR SENATOR KILGORE: I have read, in the April 25 issue of Chemical and Engineering News, the letter sent you by the board of directors of the American Chemical Society with regard to your bills, S. 607 and S. 702.

I wish to state that I am not in agreement with the sentiments expressed in that letter and I sincerely doubt the statement expressed by the board that they "believe the membership of the society is almost unanimously" opposed to these bills. From my contacts with fellow chemists I believe most of them do not know the intent of these bills or are not opposed to them. The American Chemical Society is almost completely dominated by employers and those allied with them, and they naturally are opposed to anything which would deprive them of their opportunities to exploit the training and ingenuity of chemists for the purpose of profit.

I believe the testimony of Judge Thurman Arnold before your committee to be a very clear expression of the facts and agree heartily with it.

The American Chemical Society board of directors took it upon themselves to speak for the society without either canvassing the membership or publishing a complete copy or review of your bills.

Will you please send me copies of your bills for my information, since I do not know all their details. Although I may not be in accord with every detail of your bills, I agree with the purpose in divorcing scientific research from profit, since profit always takes precedence over the acquisition of knowledge.

Very truly yours,

J. D. QUIST.

EXHIBIT No. 75

MAY 24, 1943.

Mr. J. D. QUIST,
Detroit, Mich.

DEAR MR. QUIST: This will express my warm appreciation for your fine letter of May 9 regarding the decision taken by the board of directors of the American Chemical Society with regard to Senate bills 607 and 702.

I have already received a flood of letters from members of the American Chemical Society indignantly protesting the arbitrary action of their board of directors. It would seem highly desirable that the American Chemical Society seek a more democratic expression from their membership and make available to them pertinent information regarding these legislative measures; particularly the science mobilization bill, S. 702.

I am enclosing for your information copies of these bills, a résumé of the salient features of S. 702 and the full testimony of Judge Thurman Arnold before this committee and would welcome your comments and recommendations.

May I suggest that you and your associates can make a real contribution toward a fair decision on these matters by making your views known to your own congressional representatives.

Sincerely,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 76

PITTSBURGH, PA., *May 4, 1943.*

Hon. H. M. KILGORE,
Chairman, Subcommittee on Technological Mobilization,
Committee on Military Affairs, United States Senate,
Washington, D. C.

DEAR SENATOR KILGORE: It has come to my attention that the American Chemical Society through its secretary has written you in opposition to bills S. 607 and S. 702.

Digitized by Google

I am and have been for some years a member in good standing in the American Chemical Society. Unfortunately I do not have a sufficient knowledge of patent procedure to comment intelligently on the merits of the bills under consideration. I should like to point out, however, that it is no secret that the American Chemical Society is dominated by the large chemical companies and the policies of the society reflect the interests of these large corporations. It is not surprising, therefore, that the society should go on record as opposed to bills S. 607 and S. 702 since these bills seek to correct the abuses perpetrated by some of these same corporations.

I do not share the belief that the membership of the society "is almost unanimous in its opposition" to these bills and I assure you this statement by the society rests on no survey of the membership's opinion.

Sincerely yours,

MILTON ORCHIN.

EXHIBIT No. 77

MAY 26, 1943.

Mr. MILTON ORCHIN,
Pittsburgh, Pa.

DEAR MR. ORCHIN: I appreciate very much your letter of May 4 informing me that the American Chemical Society is dominated by the large chemical companies and that the policies of the society reflect the interests of these large corporations.

I am also glad to learn that the position of the society in opposing S. 702 does not express the views of its membership.

Those of us who believe that careful planning is required so that these energies may be used to the maximum benefit of mankind are naturally deeply concerned over the action taken by the American Chemical Society, but I feel confident that when they better understand the situation the majority will be as anxious as you and I are to have this legislation passed at once.

Your efforts to cooperate are very much appreciated.

Sincerely,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 78

AMES, IOWA.

Hon. H. M. KILGORE,
United States Senate, Washington, D. C.

MY DEAR SENATOR KILGORE: I wish to register my protest to the recent disapproval of Senate bills 607 and 702 by the directors of the American Chemical Society.

I am a research chemist, and the chemists I am in contact with heartily endorse the above-mentioned bills. I believe the majority of chemists are not in favor of the directors arbitrary decision.

I can see a great increase in the service of science to society under the stipulations of the Kilgore bills and hope for their speedy enactment.

Very truly yours,

OLIVER JOHNSON.

EXHIBIT No. 79

MAY 22, 1943.

Mr. OLIVER JOHNSON,
Ames, Iowa.

DEAR MR. JOHNSON: This will express my warm appreciation for your recent letter indicating your approval of Senate bills 607 and 702. I have received a great many letters similar to yours which indignantly protest the decision of the directors of the American Chemical Society.

In a matter which is of such direct interest to each member of the American Chemical Society it seems reasonable to expect that the officers would formulate programs to stimulate discussion and constructive criticism of the science mobilization bill. I suggest that you and your associates might make a real contribution by making your views known to your own congressional representatives.

I am enclosing for your information material pertinent to both bills and will welcome your comments and recommendations concerning them.

Sincerely,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 80

THE CLEMSON AGRICULTURAL COLLEGE,
Clemson, S. C., April 29, 1943.

Senator H. M. KILGORE,
United States, Senate, Washington, D. C.

DEAR SENATOR KILGORE: This will thank you for the copy of Senate bill No. 702 which I have read with a great deal of interest.

You are to be commended for your thinking and actions toward developing a sound philosophy for America. You no doubt realize that this is a great country because of its fine institutions and we hope that they can contribute much more to the needs of a prosperous country after the war is over.

Many of the achievements, discoveries, and valuable assets of this country have been created by research individuals at a very low cost. It seems to me that it is a means of utilizing those who are research-minded in a manner that will greatly add to the values of this country. Then too we cannot have too many research men. There are millions of unsolved problems that could easily be studied by a much larger staff of research workers than this country now has.

Despite the fact that the pure research men have been very largely responsible for the airplane, the telephone, the electric light, for many chemical products, and for animal and plant breeding of note, they have received much less for their efforts than the semiapplied individuals. I hope that your bill will revive an interest in these pure research workers who may never appear in the newspapers but whose patience and contributions enhance the Nation. The land-grant colleges have fought much that has been classed as New Deal, because there has been little regard for the individuals who have brought agriculture to its present state of perfection and many of these new organizations with tremendous amounts of money have foreshadowed their efforts. After the war is over I hope that Congress will again give some cognizance to what is fundamental and basic in agriculture as compared to the so-called economics and sociology complexes that cannot, because of their very nature, emphasize a scientific approach.

I thank you for sending me a copy of the bill and hope that you may be successful in carrying it through. I shall call this matter to the attention of our congressional delegation.

Sincerely yours,

R. F. POOLE, *President.*

EXHIBIT No. 81

CALIFORNIA INSTITUTE OF TECHNOLOGY,
Pasadena, May 31, 1943.

Senator H. M. KILGORE,
Senate Committee on Military Affairs, Washington, D. C.

DEAR SENATOR KILGORE: On April 26 you wrote to me stating that you hoped to call on me shortly to discuss the science mobilization bill. A copy of the bill was enclosed.

Since I have heard nothing further from you, I suppose that other demands on your time have prevented you from getting out here. I regret missing the opportunity of meeting you and discussing this proposed legislation with you. In accordance with your request, I am writing you some of my comments on the bill.

I am in entire agreement with you that the scientific and technical resources of this country are not now organized to make maximum contribution to our society, either for peace or war. In considering legislation to improve this situation, it seems to me the peacetime needs of the country are at least as important as the war needs, though the present emergency is bound to focus attention primarily on war needs. However, if our scientific and technical resources had been

Digitized by Google

organized for effective peacetime service, I believe there would now be less difficulty in meeting the war emergency.

Legislation to improve the utilization of science and technology should be based upon a thorough understanding of the reasons for present failure to obtain full utilization. In my opinion, the principal reason for this failure is that our scientific and technical resources have been developed primarily to serve private profit rather than national interest. Private profit has not always been consistent with the national interest, and there is abundant evidence that it may also be inconsistent with the war effort. I refer especially to private profit in the case of monopolistic enterprise. My chief criticism of the proposed legislation is that it fails to take this state of affairs into consideration. It seems to me that unless scientific and technical progress can be released to some extent from the primary obligation to serve private profit, then legislative efforts to improve matters are likely to achieve very little.

I note that the bill contemplates the creation of a new and independent Government agency, the Office of Scientific and Technical Mobilization. Very likely you have already considered the possibility that your purposes could be achieved through broadening the powers and functions of existing Government agencies, and you may have rejected this possibility for cogent reasons. But it seems to me that the functions of the Office of Scientific and Technical Mobilization, as set forth in the bill, overlap the functions of certain existing agencies, such as the Department of Agriculture, the National Bureau of Standards, the United States Bureau of Mines, etc. Is it not possible that agencies now charged primarily with scientific or technical work could be empowered to extend their attention to the economic and social aspects of their work? This might require an expansion of personnel, and an increase in expenditures, but it would seem to me more promising to tackle the problem through existing agencies rather than by setting up a new one.

I would welcome an opportunity to discuss these and other aspects of the bill with you personally, if there should be an opportunity. If this is impossible, I shall be glad to write you in greater detail, if you wish to have further comments from me.

Thanking you for your letter,

Sincerely,

ROBERT EMERSON,
Assistant Professor of Biophysics.

EXHIBIT No. 82

JUNE 15, 1943.

MR. ROBERT EMERSON,
Assistant Professor of Biophysics,
California Institute of Technology, Pasadena, Calif.

DEAR MR. EMERSON: When I was in Los Angeles the early part of May, I tried to reach you for a meeting that Dr. Elmet Belt held with a number of other scientists to discuss the science mobilization bill. Unfortunately, my schedule was so short that the meeting had to be called together on a little over a day's notice and we were unable to get in touch with you.

I am very grateful for the comments in your letter of May 31. I am in complete sympathy with your observations on the evil effects of monopoly in deterring scientific research and technical development. I had hoped that an adequate correction of this ill was included in the language of my bill. If not, I should be glad to know what wording you believe would carry this out.

Regarding the Office of Scientific and Technical Mobilization—the language of the bill does not spell out my ideas in as great detail as perhaps might be desirable. I envisage the Office of Scientific and Technical Mobilization as a small, centralized, coordinating clearing house carrying out its powers and functions just as far as it is able through the maximum utilization of existing agencies and facilities, such as the Department of Agriculture, the Bureau of Standards, the Bureau of Mines, etc. Only after all other existing mechanisms have been exhausted would the Office of Scientific and Technical Mobilization create new means of carrying out essential projects.

I would appreciate it greatly if you could glance through the enclosed copy of our previous hearings on this bill and on its predecessor S. 2721. This may

Digitized by Google

give you a further idea of what is projected by this legislation; and your additional comments on changes, additions, or deletions would be very helpful to me.

I do not intend to return to the coast in the near future, but if you should happen to be in Washington I am very anxious to talk with you.

Very sincerely,

H. M. KILGORE,
United States Senator.

SOUTHWESTERN COLLEGE,
Winfield, Kans., April 22, 1943.

Hon. H. M. KILGORE,
Senate Office Building, Washington, D. C.

DEAR SENATOR KILGORE: This will acknowledge receipt of the copy of Senate bill 702, dealing with science mobilization, which you have introduced. The purpose back of the bill intrigues me greatly. I shall give it most careful consideration.

May I offer you the following suggestion: In the nature of the circumstances that obtain, it will be the large universities who do most of the research work. They have the elaborate, well-equipped laboratories that are essential for such projects. Recognizing this fact, it is easy to lose sight of the other fact, that the small liberal arts colleges make a real contribution in the training of personnel for research work. There are some distinct advantages inherent in the small college situation. I am thinking particularly of the way that small classes bring students into direct contact with the heads of departments in the critically important elementary courses. This has resulted in the small colleges of the United States sending a disproportionately large number of gifted and superior students into graduate study and research positions.

It almost inevitably works out in large universities that courses are given with student assistants giving much of the instruction, with a minimum of personal attention. It would seem to me that any program designed to stimulate and sustain the program of scientific research in America ought to give careful consideration to the underwriting of the small college program. This might be done in terms of scholarship aid, or gradute fellowships, or appropriations for laboratory equipment and increased library resources.

I shall write you again after I have had time to give the terms of the bill, as you have prepared it, consideration.

With all good wishes, I am,

Sincerely yours,

CHAS. E. SCHOFIELD, *President.*

EXHIBIT No. 84

HAVERFORD COLLEGE,
Haverford, Pa., April 30, 1943.

Hon. H. M. KILGORE,
United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: I much appreciate your courtesy in sending me a copy of the science mobilization bill recently introduced in both Houses of Congress.

The objectives of this bill are undoubtedly of the most fundamental importance and the need for preventing the disintegration of scientific research in the universities and colleges is very real.

I cannot help wondering, however, whether certain of the functions suggested in the proposed legislation do not overlap the work of the National Research Council. That organization is so highly regarded in scientific circles that it would seem to be a good idea to prevent any possibility of duplication of function.

To put the matter another way, if your bill could carry the endorsement of the National Research Council, I believe the support of university and college personnel would be almost automatic.

Sincerely,

FELIX MORLEY.

EXHIBIT No. 85

FRIENDS OF THE ARMY MEDICAL LIBRARY,
Washington, D. C., June 3, 1943.

Hon. H. M. KILGORE,
United States Senate, Washington, D. C.

DEAR SIR: In reference to the authority in your bill, S. 702, for supervising the reorganization of the publication of the results of governmental scientific research—the phrase in section 1 (6) undoubtedly covers the subject in a general manner. Although this may be sufficient I believe the point is of such fundamental importance for the advancement of science and technology that a more specific instruction under section 4—Powers of the Office—would be more effective. I would suggest a paragraph under this section, such as "To coordinate the publication of reports of scientific research in a manner designed to insure their most widespread distribution to all capable of using them for the advancement of science."

This would call attention to the special need for such an activity on the part of the Office of Scientific and Technical Mobilization.

Since writing to you last, I have been disappointed at the lack of enthusiasm and apparent opposition to your bill by some of our scientific societies. The apprehension appears to be that such an Office of Scientific and Technical Mobilization would discourage and possibly interfere with private initiative in these fields. It is also intimated that everything needed along this line is already being done by private organizations which now exist.

Although it is certain that much has been accomplished by individual and collective efforts of the scientists and industrialists of the country, it should be evident to everyone that a greatly expanded and coordinated effort to advance science and technology is the one certain way of assuring the future welfare of our own and other peoples throughout the world.

This means of raising the standards of living is of no less importance than providing for the health and well-being of the Nation, by means of an efficiently organized Public Health Service.

You certainly have my admiration for the foresight which has prompted you to introduce your bill, S. 702.

Yours very sincerely,

ATHERTON SEIDELL.

EXHIBIT No. 86

Washington, D. C., April 27, 1943.

Hon. H. M. KILGORE,
United States Senate.

MY DEAR SENATOR: I have received your letter of April 23, addressed to me at the National Bureau of Standards (from which I have now been retired), enclosing a copy of the bill S. 702, and a summary of its provisions.

The purposes of the bill, to promote the maximum utilization of our scientific and technical resources, facilities, and personnel, are admirable. As to the plan proposed, it seems to be an excellent start. Difficulties will always arise, as hindsight is better than foresight, but these difficulties can be amended as they may discover themselves. All that is necessary is to keep in mind the end to be attained, and profit by mistakes, if any.

One thing should be made clear by those who are putting this bill through—that there is no intention of carrying planning so far as to stifle individual genius.

It is related that at one time a high British official come to see Faraday in his laboratory. He had heard much about Faraday's discoveries, and knew little about the subject. Faraday showed him a number of electrical experiments, until finally the official said: "What is the use of all this?" Faraday replied, "Perhaps some day you will be able to tax it."

I doubt if even Faraday visualized the multitudes of persons today who make their living in one branch or another of the electrical industries.

Very truly,

PAUL R. HEYL.

EXHIBIT No. 87

NORTHWESTERN UNIVERSITY,
Evanston, Ill., May 5, 1943.

Hon. H. M. KILGORE,
Committee on Military Affairs,
United States Senate, Washington, D. C.

DEAR MR. KILGORE: This will acknowledge your communication of April 23 concerning S. 702, the science mobilization bill. I am writing to you to indicate that while I believe that this is a step in the right direction, the failure to include specifically the social sciences is a very serious defect in my opinion.

As one working in a field which cuts across the natural sciences, the social sciences, and the humanities, I have been increasingly impressed with the absolute need to unify scientific endeavor in all fields. It is apparent that many of the problems arising out of the development of technical competence derive from the fact that we are not alert to social implications.

Therefore, I hope your bill can be amended in such a way as to insure that the proposed Office of Scientific and Technical Mobilization will include in its administrative staff, its board and its technical committee, a full representation of social scientists who, working with the representatives of the exact and natural sciences, will insure that our technical development will be geared in with a full consideration of the human problems arising out of such development.

Very truly yours,

MELVILLE J. HERSKOVITS.

EXHIBIT No. 88

UNIVERSITY OF MICHIGAN,
Ann Arbor, Mich., April 28, 1943.

Hon. HARLEY M. KILGORE,
Senate Office Building,
Washington, D. C.

DEAR SENATOR: I appreciate the privilege of reading your bill to mobilize the scientific and technical resources of the Nation, and your invitation to offer suggestions thereon. I have little to say in the way of general considerations, as I regard the bill is very carefully conceived and well worded. The declaration of policy is admirable.

Any ideas I may contribute deal with matters in which I have had some personal contact. The most pressing single matter with which I have been concerned recently is that of available personnel for research and administration of natural resources. The need for efficient administrators of the Federal conservation agencies is particularly vital now (as I indicated in 1939 to Mr. Ickes, in connection with my investigation of fisheries administration in Alaska). At a recent session of the technical committee of the American Wildlife Institute I discussed this matter in some detail with the institute's president (Senator Walcott). This is how the question looked to us: Among the remaining men charged with the development and safeguarding of our wildlife resources, the majority, numbering about 500, are liable to military duty. They would add less than one man per division. Yet without the continued service of these men the wildlife resources, including the fisheries, are threatened. A sharp depletion of the renewable resources cannot be justified, if for no other reason than that we might be left in a terrible predicament if such depletion is allowed to take place. As the world goes, we are not suffering very seriously now for lack of food and other sustaining elements, to which wildlife heavily contributes. Desperate straits will likely be reached, if ever, only after years of war. We may (or may not) expect and trust that we may be spared that fate—but it would be folly not to prepare for such an eventuality. If, then, our sustaining resources should be badly depleted, we would suffer, perhaps fall. Similar arguments could be made—and rightly—for other lines of scientific and technical service.

The provision in your bill for the designation of certain scientific professions as "essential" fields is good and I hope not "too little and too late." Many keymen have been lost to research and technology already. Some provision by which the most irreplaceable might be returned to scientific work would be valuable.

Digitized by Google

A point that has been altogether too much overlooked is that, in many lines of scientific and technological work, it takes about 6 to 10 years to train a man well in theoretical aspects of the science or art; he needs then spend an apprenticeship before he becomes a really effective producer. In contrast it takes a few months, at most a year or two, to make a good soldier. Relatively few are capable of leadership in science; millions make good soldiers.

I take it, it is the new manpower policy to keep in training some young men in medicine and a few other technical fields, so that replacements will be coming along when and if most sorely needed. This policy should be broadly extended so that reserves will not be lacking in any technical field—for the war and for reconstruction. The Office of Scientific and Technical Mobilization might well be charged specifically with the responsibility of seeing to it that the country shall not be left at any time without such reserves in its army of scientific workers.

I am not wholly clear, on reading the bill, just how existing agencies, such as the Bureau of Standards and the National Academy of Sciences, would be integrated into the new office. How well the job is done will depend, I suppose, on the ability and tact of the Administrator.

Sincerely yours,

CARL L. HUBBS,
Professor of Zoology and Curator of Fishes.

EXHIBIT No. 89

UNIVERSITY OF MICHIGAN,
Ann Arbor, Mich., April 28, 1943.

Hon. H. M. KILGORE,
United States Senate,
Washington, D. C.

DEAR SENATOR KILGORE: I have read with interest the science mobilization bill which you were good enough to send me. Since I have some ideas regarding this bill, I am accepting your invitation to make comment.

In general I am in full sympathy with what I believe to be its purpose: To make more general public use of the American capacity for scientific advancement. The bill seems to me, however, to have certain faults which go back to a fundamental feature of scientific work. There is a rather clear distinction between advancement of science and application of science. Most of the great advances in science have been made through efforts to discover new truth without any thought of its value to man. Pure science often makes its discoveries in an accidental haphazard way. Not until a decade or a generation later does anyone learn how to use the new knowledge to ameliorate conditions of mankind. Applied science is thus merely the pure science of an earlier time. The former cannot advance without the latter.

It would be my hope that when the Federal Government fosters advancement of science, it will foster pure science along with, or ahead of, the applied. Perhaps this bill is supposed to do both. Perhaps if the right Administrator could be named, both pure and applied science would be aided. But the bill gives the Administrator a good many things to do which are pure organization. He is directed to do many things and is authorized to do many others. The set-up seems to put a premium on organization.

By the time the Administrator does all his mandatory organizational duties, he is not going to have much energy left to consider the correct relation of applied science to pure science. I would like to see the bill simplified. Cut down on the required activities, and give the Administrator some freedom to work out plans which he thinks will advance science.

Scientific men are roughly of two kinds—some are organizers, some are research men. Only rarely are both abilities combined to a high degree in the same person. Under the science mobilization bill as it stands, only an organizer could be happy in the Administrator's job. But I think the research type of man would do the country the most good in the long run. If the amount of necessary organization could be so reduced that a research man would be willing to undertake it, and then a research man appointed, I believe we stand to gain much through the fostering of research.

Sincerely yours,

A. FRANKLIN SHULL,
Professor of Zoology.

EXHIBIT No. 90

THE UNIVERSITY OF NORTH CAROLINA,
Chapel Hill, May 14, 1943.

Senator H. M. KILGORE,
Washington, D. C.

DEAR SENATOR KILGORE: Thank you for your courtesy in sending me a copy of your bill, S. 702. I have given this matter some thought, and have noted several discussions, in particular critical statements by officers of the American Chemical Society and the American Institute of Chemists, appearing in their official journals. Although I am a member of both these organizations, I am not necessarily influenced by the opinions of their officers, which I consider as expressions of their personal views. Rather, my social outlook coincides with that of the American Association of Scientific Workers, of which I am a vice president.

As a matter of fact, my mind is not entirely made up on this bill. I agree with most of your objectives, and, in particular, I think the interests of the public should be safeguarded as regards the use of patents. I do not believe that reasonable regulation in this field will choke off individual initiative as is so often alleged. There is one criticism of the bill, however, in which I do concur, and I believe that if this matter were corrected, the bill would be viewed with more favor by scientists in general. Namely, I believe that the direction of the proposed Office of Scientific Mobilization should be firmly in the hands of scientifically trained men. The administrator, in particular, should be a man of scientific attainment, and the board should probably have a majority of scientists on it, and these scientists should represent both the physical and the biological sciences. It would be, of course, necessary to have some safeguards to make sure that not too many of these scientists were in reality merely representatives of industrial interests.

I am, indeed, gratified by your interest in the training of men in the scientific professions. It would be a splendid thing if provision could be made for those of genuine talent who are now denied this training because of financial disabilities.

With best wishes,
Sincerely yours,

OSCAR K. RICE,
Associate Professor of Chemistry.

EXHIBIT No. 91

MAY 24, 1943.

Dr. OSCAR K. RICE,
Associate Professor of Chemistry, the University of North Carolina,
Chapel Hill, N. C.

DEAR DR. RICE: This will express my warm appreciation for your fine letter of May 14 concerning the science mobilization bill, S. 702. It is very encouraging to note the constructive attitude taken with regard to this measure by a great number of leading scientific people.

The recommendation that the direction of the proposed Office should be firmly in the hands of scientifically trained men only has frequently been made and I believe warrants further study. By way of explanation, I should like to offer for your consideration the point of view held by the authors of the bill at the time it was written.

First, it is necessary to provide for sufficient freedom of action for the Administrator of this Office and at the same time sufficient check on his operations. This we feel has been accomplished by granting him rather wide authority and also providing that the Scientific Board "have access to all information of the Office relating to the administration thereof." This would enable the Board to "smoke out" any unfavorable action of the Administrator to the President.

The second consideration is related to the make-up of the Scientific Board and committee. Since the decisions which these groups will be called on to make may directly affect the total economy of the Nation it is necessary that there be representation of broad branches of our economy. It should be borne in mind that these groups are policy-making bodies who will not necessarily deal with the scientific and technical aspects of any given problem but will be concerned with the implications of such a problem or project to our over-all economy. The scientific projects

Digitized by Google

which the proposed agency would consider would be formulated, planned, and executed solely by competent technical and scientific groups and committees chosen for their outstanding abilities in the particular scientific field with which the problem is concerned.

It seems also reasonable to expect that the representatives of the various groups on the Board and committee and even the Administrator himself will be either scientists in their own right or people intimately related to the scientific and technical interests of their respective groups. Of course, it would be most desirable that the Administrator be both a man of scientific attainment and competent in the field of administration. However, in drafting legislation it is not wise to rigidly define the type of person who would best administer the proposed office. In this connection it would be extremely helpful to have recommendations regarding the detailed qualifications for such a position from as many scientific people as possible.

I shall hope for your continuing support and will welcome all additional recommendations you may care to offer.

Sincerely yours,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 92

IOWA WESLEYAN COLLEGE,
Mount Pleasant, Iowa, May 11, 1943.

Senator HARLEY M. KILGORE,
United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: In answer to your communication of April 17 requesting our comment on bill No. S. 702 I am enclosing a personal note to me from Dr. Harry Jaques, one of America's outstanding biologists. His textbooks are used throughout the Nation, and I know of no biologist with greater standing; therefore his comments are worthy of your consideration.

Sincerely yours,

STANLEY B. NILES, *President.*

EXHIBIT No. 93

MT. PLEASANT, IOWA, *May 1, 1943.*

DEAR PRESIDENT NILES: I have read this entire matter carefully and with considerable interest. It would seem to be a good and desirable provision to put into practice.

The question of Federal versus private control of any enterprise has many debatable angles. This seems to be a provision to aid private enterprise and to prevent it defeating its own best interests by overworked monopoly. As provided in the bill, there would seem to be scant chance of the office wrongly suppressing private enterprise.

The private scientist, inventor, or corporation needs to be assured of an adequate reward for successful achievements.

I feel that such a measure as this is even more desirable for the coming peace years than when we are in a state of war. The encouragement of scientific cooperation, the elimination of costly duplications of effort, and the restraint of monopoly is desirable.

The provisions for training and aiding scientists seem timely. It is particularly desirable in times like this that pure science research should not be severely hampered, for, directly or indirectly, through it come eventually many of our most practical discoveries. Encouragements in this training is essential to maintain a steady flow of trained personnel in applied fields. The office could apparently encourage scientific interest among children, also. There is much cheap talk and glorification of science by a doting public, but if our country is to retain its ability in scientific lines, genuine study and hard work will be essential.

Any measure leading to a more thorough training of our youth who have scientific interest and ability would be well worth while.

I hope I have done as you wished.

H. E. JAQUES.

EXHIBIT No. 94

UNIVERSITY OF MICHIGAN,
Ann Arbor, Mich., April 28, 1943.

The Honorable Senator HARLEY M. KILGORE and MEMBERS
OF THE UNITED STATES SENATE COMMITTEE ON MILITARY AFFAIRS,
United States Senate, Washington, D. C.

DEAR SIRS: Your science mobilization bill (S. 702, H. R. 2100) seems to me admirable, marking an essential step forward in our Government. More than in any other country in the world, the life of the citizens of the United States have been changed by scientific achievements. There has been here more widespread participation by all the people in such modern devices as telephone, radio, automobile, and the like.

The cartel disclosures have revealed that in aluminum, for example, and also in electricity, etc., private corporations have been able to keep the scientific achievements away from our citizens by legal chicanery, preventing proper production and even general introduction of the advances of modern science. The efforts of large corporations to prevent the completion of the great electrical projects which are now in full swing are also well known.

It seems to me that you should incorporate a provision in your bill to protect the national interest on every occasion in which scientific experts—and often pseudo experts—are called in to testify in Senate and congressional hearings on any bill involving scientific matters. Any experts who are to testify should be required in advance to submit in writing a sworn statement as to their paid connections with industry and corporations. Your proposed office should be charged with the responsibility of furnishing competent scientists whose only interest will be the public and national interest.

Enclosed is a document involving a resolution which I, as a delegate of the History of Science Society, introduced on January 29, at the annual meeting of the American Council of Learned Societies. It is pertinent to the work of your committee.

LOUIS C. KARPINSKI,
Professor, Mathematics Department.

EXHIBIT No. 95

HISTORY OF SCIENCE SOCIETY,
Ann Arbor, Mich.

To the Members of the History of Science Society, and the Delegates at the Twenty-fourth Annual Meeting, American Council of Learned Societies.

GENTLEMEN: As a delegate to the twenty-fourth annual meeting of the American Council of Learned Societies which was held in New York January 28–29, 1943, it seems obligatory to me to report to the History of Science Society—and to the delegates to that meeting—two matters which seem to me to call for some action if there is to be any good to result from the annual meetings.

(1) There was an extended report on the modern language program of the American Council of Learned Societies which, I regret to say, seemed to me to be particularly designed to discredit the Army and Navy programs, even those established and in running order. It is in the highest degree unfortunate that any council of learned societies should lend itself to any suspicion of anything but disinterested concern for the welfare of science and learning. Mr. Graves gave a proper account of the activities of the American Council of Learned Societies connected with the Provost Marshal's office. However, upon my query whether other courses in language training were not in progress in many universities, Mr. Graves replied to the effect that every college in the country had some program, with some depreciating remarks concerning these. I pressed the point and did succeed in securing an admission that there were courses in Japanese and other languages under the Regular Army services and the Navy at the University of Michigan, at Colorado, in California (at several institutions, I believe), and at Oregon; further, that these were not at all any hysterical projects, as had been implied by Mr. Graves. In any proper survey of the language courses planned and projected these activities should have been mentioned, as these involve some thousands of students. So far as the Provost Marshal's projects are concerned—

Digitized by Google

largely, I believe, for post-war activities—it appears that there is some question whether any funds have been appropriated for such language developments. The Army has complained about the pressure brought on the Army by one at least of the projects apparently supported by the American Council of Learned Societies, which seems to have deserved the criticism. In any event, the major active going projects involving hundreds of students of Japanese, Chinese, etc., are these which were absolutely ignored by Mr. Graves' report.

Whatever motive inspires the American Council of Learned Societies to undertake a language program at the present time should motivate the American Council of Learned Societies not even in appearance to lend itself to all too common attempts to smear Government (Army or Navy) projects which are under way.

(2) Professors and scientists in governmental employ allied with great corporations.—The bottleneck in production for war purposes of aluminum, carboloys, artificial rubber, magnesium, and other metals was largely occasioned by the cartel agreements arranged by such corporations as Standard Oil with German and Japanese agents. To overcome this it developed that the opening of smaller units for treating sponge iron, for different treatment of aluminum ores to use poorer ones, and the like, was absoutely essential to any success in speed. To this end Secretary Ickes attempted to secure help along these lines from the National Academy of Sciences, from the Geological Survey, the Bureau of Mines, and other governmental agencies scientific in character. In almost every instance Secretary Ickes found that the men assigned to give him aid were men having private contracts with the larger corporations and that the advice given was that which would serve the interests of the larger corporations, served on the side by these professors and scientists.

In view of the publicity given to this justified attack upon professors in our universities and scientists in Government services, both supposed to serve first the public interest, it seemed to me imperative for some of the great organized groups of scientists and scholars such as the various councils of social service, national research, education, and learned societies, to make some definite effort to restore the scholars and professors to their former position in the public confidence by explicit mention in college catalogs of the connections of college and university teachers with private industry.

To this end I introduced the following resolution at the annual meeting of the American Council of Learned Societies:

"*Resolved*: The American Council of Learned Societies regard with disapproval the extensive inroads made into university and college staffs of America by great corporations and public utilities; these have been revealed somewhat accidentally, and most unfortunately in connection with legal actions or other actions affecting the public interest.

"In all matters of the public interest, the American Council of Learned Societies affirms its belief that in a democracy the professors in universities and colleges should serve only the public interest.

"We recommend to the university and college administrative officers that all teachers in institutions of higher learning be required to note to their college officials their contractual connections with corporations or private or even public utilities. These connections should be noted after the teachers' names in some readily accessible publication for each institution, so that any pronouncements may be judged by the public and the press as to whether such pronouncements emanate from a financial interest or from an academic (unpaid) interest in the public welfare."

Insofar as governmental agencies are concerned, there is a possibility that a resolution may be introduced into Congress requiring any so-called experts appearing to testify before any congressional committees that these men be required to register under oath their paid connections with private interests. The various councils should be concerned to support such action.

While I am signing this statement as president of the History of Science Society, concerning whose devotion to the service of truth in science there is no question, this communication is not paid out of their funds. It would be a matter of great interest to the writer if those who have some belief in the point of view regarding the public interest of scholars which I have tried to represent would consider bringing this matter to the attention—and the action—of the societies concerned with which they are affiliated. Correspondence is invited in furtherance of the aims stated.

LOUIS C. KARPINSKI,
President, History of Science Society.

EXHIBIT No. 96

HISTORY OF SCIENCE SOCIETY,
Ann Arbor, Mich., June 4, 1943.

Hon. HARLEY M. KILGORE,
Chairman, Senate Committee, S. 702,
United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: Few people realize the extent to which corporate and vested interests, such as privately owned utilities, have gained control of the opinions of technical experts, supposedly in primary employment of universities, colleges, and technical bureaus of the United States Government, and even State scientific bureaus. This situation holds particularly with reference to engineers, chemists, electrical experts, political science experts of many categories, etc. These gentlemen have unfortunately regarded their services and their opinions as for sale to the highest bidder, naturally secretly on the side. In consequence, your Committee on the Office of Science and Technology begins to have a howl from the engineering societies and some other scientific societies. College presidents, too, will be out in force at the threat to our free and democratic institutions. I fear they believe there will no longer be an open market for our freedom and democracy in science. The college presidents will be put to it to find the money for decent salaries which has so long been supplemented at Harvard, at Yale, at Michigan, at Massachusetts Institute of Technology, and at a hundred other institutions; witness the record in the nauseating tale of the National Electric Light Association, which tried unsuccessfully to remove the stench by renaming itself the Edison Institute, but it is still no rose.

I have noted the fear that politicians will dominate in some mysterious way our science and our technology. At least the politicians change from time to time and thus the public interest gets a break as it never has with the great utilities. The Standard Oil cartels, the various attempts of the united gas and electric privately owned utilities to keep the public from the enjoyment of the benefits of modern science as found in electricity and in artificial and natural gas, the Aluminum Co. of America together with a score of other minor but powerful companies have gained control of important fields by cartel agreements absolutely contrary to the public interest. These great corporations are definitely responsible for the lives of thousands of our American boys that will be sacrificed because we did not have the aluminum, the rubber, the electrical capacity, etc., in time as we would have had if democratic process had been allowed to function. These same organizations have already made their plans to seize control after the war ends by similar methods supposedly for the preservation of our democratic institutions, however, as represented by corporate cartel agreements.

No politicians could be as vile, as quick to suborn perjury, and as deliberate in instigating even murder, on occasion, to attain their ends than these corporate groups have been. Science and our technical processes, as applied in America and in the world, for the common man will be far safer in your hands—I mean in the hands of the United States Congress—than they are now. The scientific organizations are dominated often by men whose morality permits them to sell out the public interest. Compel the scientists if they wish to have their opinions respected to register their on-the-side jobs, or fees received from corporate interests other than the universities. Publish their names and their connections and then use as advisors, those men who have no entagling alliances.

Somehow your committee should see to it that these great corporations such as Standard Oil and Alcoa, that they should not receive gifts from the United States Government of plants and equipment for artificial rubber, for aluminum that will enable them to repeat after this war the tricks which they practiced on the American people before the war. The cartel agreements are a record of foul play against the people and against the Government. That "damned spot" can never be wiped out.

LOUIS C. KARPINSKI.

EXHIBIT No. 97

SWEET BRIAR COLLEGE,
Sweet Briar, Va., May 24, 1943.

Hon. H. M. KILGORE,
United States Senate.

MY DEAR SENATOR: I am wholly in accord with the purpose of the science mobilization bill, of which you kindly sent me a draft, and I wish to thank you most heartily for the courtesy you have shown in giving me this opportunity to become acquainted with the character of this proposed legislation, and to express my opinion regarding it.

As to your invitation for "comments and recommendations," I would first suggest that a few of our scientists who are known for their good judgment and common sense be invited to appear before your committee and give you the benefit of their knowledge and wisdom toward drawing up the most effective measure possible for the accomplishment of your aim. But I have little doubt that you have already thought of this yourself, and probably acted on it.

Second, I believe the intelligent people of the country are very weary of political appointments, and I therefore suggest that you take into consideration the advisability of having the administrator of your new office not appointed by the President, but elected by the A. A. A. S. as representing the scientists of the country, or perhaps the A. A. A. S. might nominate three persons from whom the President could appoint one to the office. Something of the sort might also be applied to subordinate appointments.

Third, I think we are also fed up on multiplication of bureaus, and so that instead of making this office an additional one, it might be organized as knitting together of various existing bureaus, such as standards, fisheries, surveys, etc., under strong and unified control.

With sincere wishes for the successful fruition of your endeavor, I am,

Yours faithfully,

PRESTON EDWARDS.

EXHIBIT No. 98

THE AMERICAN ASSOCIATION OF PETROLEUM GEOLOGISTS, INC.,
Fort Worth, Tex., December 22, 1942.

Senator HARLEY M. KILGORE,
Committee on Military Affairs,
United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: Your letter of November 27 to Mr. Hull, business manager of the American Association of Petroleum Geologists, has been referred to me. I wish to apologize in not answering sooner as the letter was received in Tulsa on December 9 and immediately forwarded to me, but on account of my absence from the office I have not had the opportunity of answering same.

As president and chairman of the national service committee of the American Association of Petroleum Geologists, I believe that I have had ample opportunity to study the past and present situation with respect to the application of such study to Senate bill No. 2721 on technological mobilization as sponsored by you, and I can assure you that it meets with the strongest and heartiest approval of many geologists.

I would like to inform you in as brief manner as possible of the history of the geological profession, and especially that of the petroleum geologists in the war effort. Even prior to December 7, the American Association of Petroleum Geologists became interested in the mobilization of the manpower of this group for the effective and efficient utilization in our group in the event of an emergency. After December 7, questionnaires were sent out to not only all members, but also former and nonmembers of our association. Our response was most favorable and satisfactory. The object of our questionnaire was to have detailed information on the training and experience not only in the United States but also in foreign countries, and in addition to that, any experience in other scientific fields, other than geology. Another thing taken into consideration was that the questionnaire of the national roster of scientific and specialized personnel did not cover our field in sufficient detail to outline all of the technical skills, training and experience of our members. After receiving our own questionnaires, the evaluation committee of the American Association of Petroleum

Digitized by Google

Geologists made a detailed inventory of all the special skills of every individual. Among such tabulated information were such types of technical skills as experience and ability to do topography, administration, geophysical engineering, interpretation of aerial photographs, fields of geological experience, both domestic and foreign, miscellaneous scientific interests and experience, languages, military record, draft classification, and many other items of important information.

During the years 1941 and 1942, our national service committee has done considerable work in calling to the attention of the military authorities that the skills of the geologist could be utilized very effectively and efficiently when used as geologists in their programs. The war effort committee of the Geological Society of America has worked along similar lines, and we cooperated with that committee in every respect. Up to the present time our program has only been partially successful, and if your program had been in effect, in my opinion, our results would have been 100 percent. Our greatest difficulty is that military men are not acquainted with the work of geologists, and especially the application of that science to military problems and the war effort. The geologist has had very extensive training and experience in topography and terrain studies—very important in military operations—specialized skill in the interpretation of aerial photographs, experts on map making and interpretation, specialists on geological engineering problems such as water supply, location of construction materials, road building, location and construction of advance airfields, etc. The geologist is making a very valuable contribution to the discovery and development of vital natural resources such as petroleum reserves and strategic minerals.

In World War No. 1 the geologist was attached to the Corps of Engineers and rendered very valuable service in geological engineering work. However, in this war, he could be attached to practically every branch of service and be a valuable asset when used as a geologist rather than in a capacity where his training and experience could not be utilized. For this reason we have attempted to propose that a geological corps be established in a similar position as the Corps of Engineers and Chemical Warfare, and that the chief geologist be attached to the general staff and individual units of specialists attached and assigned to the different branches of service. Up to the present time we have been only successful in placing many of our men in the Army Air Corps as intelligence officers and interpreters of aerial photographs.

There were approximately 4,000 geologists in the United States, and of this number it is estimated that 500 are in the military service and 150 in civilian capacities with governmental agencies directly connected with the war effort. Of those in military service, I would say that only about 125 are in positions where a part of their training and experience as geologists can be utilized; the balance have been scattered through the armed forces in such a way that they will not have an opportunity of giving valuable geological advice. As an example, I know of some good experienced geological engineers who, when drafted, were assigned to the Medical Corps and in other types of work in other branches where all their technical skill was lost. In my opinion this situation is a very serious one for not only the geologist, but also for other scientific groups as well. In other words, in my opinion, there has been a very serious wastage of scientific manpower under the past program of drafting and enlistment.

One of the most important weaknesses of the present insofar as governmental agencies are concerned is the policy some of them have been following in the war effort. Many of these governmental agencies and scientific organizations perform their functions by request, both military and civilian. These functions are only a part of what could be done to fully utilize their technical skills and talents, so that if they did have a free hand in making recommendations and suggestions and were cobperative in doing so, it would add considerable efficiency and valuable information and assistance in perfecting full utilization of their functions.

In line with your suggestion as to other members of the American Association of Petroleum Geologists being interested in this bill, I would like to refer you to K. C. Heald, Gulf Oil Corporation, Box 1166, Pittsburgh, Pa., and A. R. Denison, Amerada Petroleum Corporation, Drawer 2040, Tulsa, Okla., and A. I. Levorsen, 221 Woodward Boulevard, Tulsa, Okla.

I am sure all technical men in the United States appreciate your efforts in the mobilization of all our technical skills for the successful prosecution and winning of this war. If I can be of any service to you, please do not hesitate to call on me.

Sincerely yours,

F. L. AURIN, *President.*

EXHIBIT No. 99

CALIFORNIA INSTITUTE OF TECHNOLOGY,
GATES AND CRELLIN LABORATORIES OF CHEMISTRY,
Pasadena, May 20, 1943.

Senator H. M. KILGORE,
United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: It was gratifying to learn from the bill S. 702, which you have introduced in the Senate that our country's Representatives in Congress are awakening to the importance of the part that science and the scientists are playing during both war- and peace-times. I regret not having attended the meeting in Los Angeles at which you were present, but I was not informed of the conference until too late to go.

After reading your bill the following objections to the measure seems to me to deserve attention:

1. The Administrator and the six members of his board will have to be persons of considerable wisdom and understanding as well as highly competent scientists or technologists. This is a difficult combination to find. If the appointments become of a purely political nature then the board members will not have the confidence and respect of the scientists and technologists. Is it possible to include in the bill a statement to the effect that the President shall choose the board from the National Academy of Science and other well-recognized scientific and technological societies?

2. The Administrator and members of his board should also be made members of the various principal Army and Navy boards. Otherwise the office will have only a weakly advisory function in time of war. It seems to me essential that, since warfare is now so highly technical in character, sailors, soldiers, and scientists should be on an equal footing insofar as the decisions on the facilities and techniques of warfare are concerned.

It strikes me that some wise action should be taken soon if the country wishes to avoid a condition in which the most capable young scientists are rendered incapable of giving their most valuable services; their deferment deserves careful consideration. Moreover, if advanced study and training in science and technology is abandoned throughout the period of the war, and if the war is long, this country will be caught decidedly short.

I shall be pleased if my comments are of any assistance to you.

Very truly yours,

DON M. YOST,
Professor of Inorganic Chemistry; Lieutenant Commander (Retired), United States Naval Reserve; Member, Division 10 of National Defense Research Committee, Washington, D. C.

EXHIBIT No. 100

STANDARD OIL CO.,
New York, April 5, 1943.

Hon. HARLEY M. KILGORE,
Chairman, Subcommittee on Technological Mobilization,
United States Senate, Washington, D. C.

DEAR SENATOR: I observe that in the hearing before your Committee on Technological Mobilization, Mr. Justice Thurman Arnold returned to the subject of the effect of patent cartels on the synthetic rubber and gasoline situation. As reported to me he said:

"The great synthetic rubber and gasoline patent cartel was formed back in 1929. That cartel was holding back the production of rubber until it could get its new product completely under its control. It was hiding its techniques during the preliminary stages even from the Army and Navy. Had this bill been in effect before the war, the Army and Navy would have been as far advanced in the techniques of rubber as the Standard Oil. That knowledge would have been spread to the independent industries that were trying in vain to get licenses under Standard Oil domination. The operation of the rubber cartel was not discovered until 1942. Today millions of citizens lack transportation and the war effort is slowed down because this cartel had a corner on the techniques and the research in rubber."

The charges made by Mr. Justice Arnold are not new. The Standard Oil Co. (New Jersey), for which I speak, has demonstrated on more than one occasion

Digitized by Google

that he is in error so far as it is concerned. We are puzzled at his repetition of the statement: "Today millions of citizens lack transportation and the war effort is slowed down because this cartel had a corner on the techniques and the research in rubber."

The facts are, of course, that the lack of rubber which now slows down our efforts results not from the action of any company or cartel, but from the mistaken confidence of this Nation and Great Britain that adequate supplies of natural rubber would continue to be available to us even in wartime. Synthetic rubber substitutes could not be manufactured in this country before Pearl Harbor at costs low enough to compete with natural rubber, but synthetic rubber for all the United Nations will now be manufactured in this country by means of buna rubber processes brought here and developed by Standard Oil Co. (New Jersey).

I do not wish to burden your records with facts that have been stated at length on other ocasions, but I should like to ask you to read the testimony of Mr. William S. Farish before the Bone committee in August 1942, a copy of which is enclosed herewith. I should like to refer you, also, to Mr. Farish's and Mr. Frank A. Howard's testimony before the Truman committee, which you, as a member of the committee, will recall having heard, on March 31 and April 1 and 2, and which appears in the reports of that committee, part 2, pages 4359 to 4497; also to the record of the Senate Committee on Patents, part 9, in which appears the testimony of Mr. R. T. Haslam, pages 5038 to 5060; Mr. Howard, pages 5069 to 5074; Mr. E. V. Murphree, pages 5088 to 5102; Mr. H. W. Fisher, pages 5134 to 5155, and Mr. W. C. Asbury, pages 5155 to 5175.

In the interests of accuracy may I ask that you cause this letter to be entered in the record of your committee.

Yours very truly,

R. W. GALLAGHER, *President.*

EXHIBIT No. 101

MINNESOTA ASSOCIATION OF PROFESSIONAL ENGINEERS,
St. Paul, Minn., March 22, 1943.

Hon. H. M. KILGORE,
United States Senator, Washington, D. C.

DEAR SIR: This will acknowledge your letter of March 15 enclosing copy of Senate bill 702 which deals with the establishment of an Office of Scientific and Technical Mobilization.

First, let me thank you for your letter. A review of the bill does indicate that the National Society of Professional Engineers and our State association should certainly support any coordination at a national level of scientific and technological resources of the Nation.

We appreciate that the successful conduct of the present war is dependent upon the complete use of all resources of this Nation. However, we cannot help but feel that the actual machinery of war is dependent upon the maximum exploitation of scientific and engineering personnel resources.

I have today forwarded some recommendations to Mr. Samuel I. Sacks, who is chairman of our legislative committee for the National Society of Professional Engineers and who undoubtedly will be in touch with you so that you may get the benefit of any recommendations or observations that we have regarding certain details in the bill. You may know, however, that in general the bill has the support of the professional engineers in Minnesota and we trust that some of our suggested refinements will find their way in the amended bill.

Very truly yours,

S. L. STOLTE, *Secretary.*

EXHIBIT No. 102

BALTIMORE, MD., *March 18, 1943.*

Hon. H. M. KILGORE,
United States Senator, Washington, D. C.

MY DEAR SENATOR: Yours of March 16 enclosing a copy of your bill No. S. 702 together with a synopsis of same. First permit me to congratulate you on this timely and very much needed legislation. Too bad this was not in force and effect a year or so ago, for then we would be much further advanced in the progressing

Digitized by Google

the war and preparing for the peace. I shall make it a point to contact the Senators and Congressmen from my State, also others whom I know in the Congress, asking that they support this bill and do everything to get same into being at the earliest possible moment.

No doubt you would like a short statement from me showing why I favor your bill. Well I formerly was vice president and trustee of the United States Shipping Board Merchant Fleet Corporation, and later vice president of the United States Steamship Lines. At present I am practicing as transportation and marketing consultant. I recently completed a survey of the minerals and soils of Mexico, together with their outstanding sea life on both their coasts. Naturally, distribution in Mexico is their main problem, just as it is ours in this country. Hence I made a survey and pro forma of the rehabilitation of the Mexican railroads and set up a producers' mart. Modern inventions and equipment to these ends would be most helpful and constructive. But there is no place to go that an inventor with constructive gadgets, except to those who should be interested. I need not tell you what happens when that occurs. Your bill will correct all that, at the same time make possible the benefiting and serving all of our citizens.

For instance, steel will be hard pressed for disposing of their surplus capacity in the post-war period. Naturally one would say: "What's being done about it?" Take for instance the loss of business in the past by the railroads to the trucks which was attaining alarming proportions, and from all indications unless the railroads improve method for door-to-door service and interchange between the media of water, rail, and truck, plus eliminating the delays at gateways and terminals, both steel manufacture and railroad investments will be in the doldrums of what to do. I know of several inventions that would materially assist in this respect, but the inventors not having the necessary capital to bring same into being for demonstration, many outstanding things of progress lie dormant.

In my estimation, after watching and analyzing the railroad freight handling in operation as well as analyzing their proposed methods, I feel that an inexpensive and simiple method of transfer between our different mediums of transport would be a long step forward in correcting our defective distribution system. There is no earthly reason in this modern world of ours for the railroad car to lie dormant for 2 days to load or unload; there is no reason for the great loss of time at terminals and gateways, nor for ships to remain at their piers 10 to 16 days for unloading and loading. During this time the large investment in the ship lying idle while loading and unloading does not earn on this investment, and requires that many more ships to do a specific transport job. There are several gadgets on the market that I know of that would correct these conditions. However, the inventors not having the capital with which to construct a commercial unit for demonstration, the inventor and the country get nowhere. From my contact with transportation men it seems that tradition is the rock on which all efforts at improving service are wrecked.

I hope I do not bore you with this lengthy letter, but as you were good enough to send me a copy of your bill, S. 702, I felt it my duty to not only acknowledge the same but to put myself on record for favoring its speedy passage and my reasons therefor.

In conclusion let me say that I know what our defective distribution, which is marketing and transportation, means to our people, both in progressing the war and in the peace. And if you feel at any time that you would like to have me discuss these conditions with you, or any expert you may elect, please command me.

Very respectfully yours,

J. HARRY PHILBIN, D. S. C.

DIVISION OF MINES, MINING, AND GEOLOGY,
DEPARTMENT OF NATURAL RESOURCES,
Atlanta, Ga., March 18, 1943.

Hon. H. M. KILGORE,
United States Senate, Committee on Military Affairs,
Washington, D. C.

DEAR SENATOR KILGORE: Please accept my thanks for your thoughtfulness in forwarding me a copy of Senate bill No. 702, the object of which is to authorize

Digitized by Google

mobilization of the scientific and technical resources of the Nation and to establish an office for this purpose.

I have read this bill with a great deal of interest, and I am convinced that it is something for which there has existed a crying need for a long time. I sincerely hope that it will be possible to accomplish enactment of this proposed legislation into a law. If there is anywhere we may put our shoulder to the wheel please call on us.

Again thanking you for your courtesy, and with best wishes for your success with this bill, I am,

Sincerely yours,

GARLAND PEYTON, *Director.*

EXHIBIT No. 104

NORTH DAKOTA AGRICULTURAL COLLEGE,
DEPARTMENT OF BOTANY AND PLANT PATHOLOGY,
State College Station, Fargo, April 27, 1943.

Re Science mobilization bill.

Hon. H. M. KILGORE,
United States Senate, Washington, D. C.

DEAR SIR: I am very much pleased to have received your letter of April 23, transmitting a statement of the salient features of the science mobilization bill. At this time when it seems that the existence of all free republican-type nations is at stake, it is fitting that the Congress of the United States should give close attention to the enactment of an efficient mobilization bill which shall be quite clear as to its purpose. No citizen of this country can afford to do less or give less than his most efficient effort to increase our national production and facilities for carrying on an aggressively destructive war against those who would destroy the very bases of human rights or freedom.

I wish you and your colleagues every success in this attempt to strengthen or fortify our national methods of action.

Yours truly,

H. L. BOLLEY,
Botanist and Plant Pathologist.

EXHIBIT No. 105

THE CHEMICAL FOUNDATION, INC.,
New York City, March 25, 1943.

Hon. HARLEY M. KILGORE,
Senate Office Building, Washington, D. C.

MY DEAR SENATOR KILGORE: After reading a copy of S. 702, I would like to reiterate the sentiments we have previously expressed in support of the establishment of an Office of Scientific and Technical Mobilization. I believe the present bill to be an improvement over that introduced at the last session and that the need for such legislation is just as acute now as it was last year.

There still is no organization for the impartial evaluation and development of new ideas. As a matter of fact, it seems almost impossible to obtain an authoritative opinion as to what is and what is not important to our war effort. Certainly there is no coordination of research and the result of such a situation is obvious in the duplication of effort and the consequent waste of time, money, and manpower.

Our greatest need would appear to be an impartial and authoritative body, with adequate personnel and financing to evaluate, coordinate, and develop the efforts of those who are sincerely attempting to be of service in solving the Nation's problems. I believe that the legislation proposed by you would accomplish the desired result.

Very truly yours,

THE CHEMICAL FOUNDATION, INC.,
JOHN J. FOLEY, *General Manger.*

Digitized by Google

EXHIBIT No. 106

BERKELEY, CALIF., *May 15, 1943.*

Senator H. M. KILGORE,

United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: Ill health has delayed my answer to your courteous letter of April 23, enclosing a copy of your science mobilization bill (S. 702; H. R. 2100), but I have read the bill through and now want to express my hope that you succeed in securing its passage. It will, of course, meet with strong opposition, but some law of this kind has long been needed.

Whether minor corrections or changes should be made, I am not competent to judge, and as a self-respecting man of science I, therefore, offer none. But in its main objectives, it is, I think, what we need.

I was glad to see the bill printed in the current issue of Science.

Yours respectfully,

ROBERT G. AITKEN,
Director Emeritus, Lick Observatory.

EXHIBIT No, 107

AMERICAN SOCIETY OF CIVIL ENGINEERS,
WEST VIRGINIA SECTION,
June 15, 1943.

Hon. HARLEY M. KILGORE,

United States Senate, Washington, D. C.

DEAR SENATOR KILGORE: The members of the West Virginia section, American Society of Civil Engineers, with whom I have talked recently, have shown a considerable interest in Senate bill No. 702, which you recently introduced in the United States Senate, covering the creation of Office of Scientific and Technical Mobilization.

In order that the members of the society in West Virginia may be fully informed on this important piece of legislation, I would appreciate it if I could receive a number of copies of the bill. We have about 120 members in West Virginia and could easily use 50 copies or more, if they are available without cost.

May I express my personal appreciation for the recognition which you have given to the engineering profession by the introduction of this bill.

With best wishes and kindest personal regards.

Very truly yours,

GEORGE W. MCALPIN,
President.

EXHIBIT No. 108

EVAPORATED MILK ASSOCIATION,
Chicago, May 21, 1943.

Hon. HARLEY M. KILGORE,
United States Senate, Washington, D. C.

SIR: Thank you for your letter of May 13 and for the copy, volume 3, of hearings on S. 2721. It has been interesting and instructive to us to examine the testimony and exhibits therein.

We note from your letter that the committee on technological mobilization referred back to Mr. Van Leer the comments in our letter to you of January 27, in which we took exception to some of Mr. Van Leer's testimony; chiefly to his statements concerning the relative shipping space occupied by evaporated milk and dried skim milk. We note also in your letter that Mr. Van Leer cites as his authority a statement made July 9, 1942, by Mr. Roy F. Hendrickson. This statement implies that there is a cargo space ratio of 4 to 1 for evaporated milk as compared to dried skim milk in transporting these commodities overseas. This statement was based solely upon the comparative weights of the two products, exclusive of packaging, in terms of milk solids.

It was because of this and similar statements from the Department of Agriculture that we presented to that Department, shortly following these statements,

Digitized by Google

calculations of the actual amounts of space occupied by these two products as compared to comparative weights. These figures were given to you in our letter of January 27, and show that equivalent volumes of the two products are therefore: evaporated milk to powdered skim milk, 1.9 to 1, exclusive of packaging.

Since dried skim milk contains practically none of the fat of milk, which contributes approximately half of its total food energy value, the comparisons between these two foods as to shipping space is further leveled off when they are compared on the basis of food value. This information, as given in our letter of January 27, is that equivalent shipping volumes of the two products, exclusive of packaging, in terms of gross food value, are in the ratio of evaporated milk to powdered skim milk, 1.3 to 1.

Therefore, in terms of food value per unit of shipping space, evaporated milk can be sent to our allies only slightly less economically than powdered skim milk.

A point we should like to emphasize is that as compared to this relatively small difference in shipping space involved, evaporated milk offers certain advantages in feeding problems overseas, among which are ease of utilization; a better balance of food values, since the whole milk is involved; familiarity with and general acceptance of the evaporated product; its packaging in small, stable units which enable easy distribution; and last, but by no means least, the important nutritional values of the water content of evaporated milk which has already been found to be beneficial in the feeding of soldiers and the population of north Africa—and, more dramatically, in sustaining life and diminishing muscle wasting in individuals cast adrift upon life rafts.

In your letter of May 13 is given Mr. Van Leer's remarks that "some shipping space is lost in transporting round cans, which would be utilized in shipping square packages." It is our information that the dried skim milk being purchased and sent abroad in the lend-lease program is packaged chiefly in barrels containing approximately 200 pounds of this commodity. Therefore, Mr. Van Leer's comparison of round cans to square packages is not applicable.

On the point of compression after dehydration: The latest information which we have from our industry is that compression of dried skim milk has not yet been accomplished on a practical scale. This is due to properties of elasticity, as well as cohesion, in dried skim milk and is in contrast to the comparatively successful use of compression of certain dehydrated vegetables. It is to be hoped that this can be accomplished with dried skim milk in the near future.

May we take this opportunity to express again that our industry is basically interested in both types of milk, evaporated and powdered skim. Our manufacturers are engaged in the production of both items; both are among the useful forms of milk and have vital roles in the war effort. We are submitting the above presentation for the sole purpose of clarifying for your committee certain technological aspects which we feel have not been accurately represented.

Sincerely yours,

FRANK E. RICE.

EXHIBIT No. 109

NATIONAL DAIRY PRODUCTS CORPORATION,
New York, N. Y., March 30, 1943.

Senator HARLEY M. KILGORE,
Senate Office Building, Washington, D. C.

DEAR SIR: Referring to my letter of January 5, 1943, and your reply of January 13, we suggest that the enclosed statement be inserted in the next volume of hearings on Senate bill 2721.

Sincerely yours,

ELMER J. MATHER,
Vice President.

COMMENTS ON STATEMENTS OF DR. WILLIAM DEKLEINE AT HEARING ON S. 2721, VOLUME 3, PAGES 843 TO 850

SUMMARY

Dr. DeKleine's testimony leaves the impression that billions of pounds of skim milk are annually going to waste on farms in this country and that no one has done or is doing much of anything about it. It is that general impression that we have tried to correct. We have endeavored to show that—

Digitized by Google

(1) Skim milk fed to livestock does not go to waste.

(2) The dairy industry, principally through the activities of one of its trade associations, the American Dry Milk Institute, has done much to develop a market for dried skim milk for human consumption.

(3) The increase in the use of dried skim milk for human consumption must be a gradual one, depending both on the development of supplies and the further development of a market for the product.

(4) In the meantime, as has been the case in the past, the manufacture of casein and possibly the development of other industrial uses for skim milk will serve as a balance wheel for the industry.

Amount of skim milk remaining on farms

The statement on pages 844 and 845 with regard to the amount of skim milk remaining on farms is approximately correct. The following statement in a letter from Mr. John L. Wilson, of the Bureau of Agricultural Economics, United States Department of Agriculture, is considered authoritative and gives us an up-to-date picture:

Skim milk remaining on farms, 1941

From milk skimmed on farms for sale of cream to plants and dealers: 34.2 billion pounds of milk skimmed, at 87 percent skim milk (assumes cream test about 30 percent)	[1] 29.8
From milk skimmed by producer-distributors for sale of retail cream: 5.9 billion pounds retailed as milk or cream, 0.9 billion skimmed for cream (assumed 15 percent of total), at 87 percent skim milk	.8
From milk used for farm-churned butter: 8 billion pounds milk used, at 80 percent skim milk (assumes cream churned tests 20 percent fat)	6.4
From cream consumed by farm families: 12 billion pounds consumed as milk cream, 2.4 billion pounds skimmed for cream (assumed 20 percent of total), at 85 percent skim milk	2.0
Total skim milk on farms	39.0

If the skim milk used for consumption by farm families (belived to be in the neighborhood of 5 billion pounds) is deducted, the remainder of about 34 billion pounds would be available for livestock feed .

[1] This figure may be approximately checked from manufactured products as follows:

	Billion pounds
Whole milk equivalent:	
Creamery butter	39.1
⅞ ice cream, excluding duplication	[1] 1.8
	39.9
Deduction for whole milk skimmed in plants for butter and skim products skimmed on farm	[2] 5.9
	34.0
Skim milk, at 87 percent of milk skimmed	29.6

[1] 5.7 billion gross—1.2 billion from butter and condensed milk products=4.5 billion net. Assumes ⅞ delivered by farmers as whole milk.

[2] Computed from skim milk equivalent of factory skim products in excess of that available as byproducts of fluid cream industry.

Skim milk equivalent factory products		9.7
Deducted from skim available from fluid cream sales by dealers:		
Milk and cream consumption in cities and villages	34.9	
Less retail sales by farmers and production by town cows	8.3	
Milk handled by dealer-distributors	26.6	
Assumed 20 percent sold as cream at 87 percent skim milk	5.3	
		4.6
Skim milk from plant skimming for factory products		5.1
Whole milk equivalent, at 1.15		5.9

While sufficient 1942 information is not available to make similar calculations, it would appear that the amount of skim milk left on farms would be less than in 1941 by perhaps 1 or 2 billion pounds. Milk production on farms was nearly 4,000,000 pounds higher but increased deliveries of whole milk by farmers appear to have more than accounted for the increase of production, leaving the amount skimmed for cream less than in 1941.

Digitized by Google

Value of skim milk for stock feeding

It is incorrect to speak of skim milk left on the farms as "wasted." When it is fed to livestock it is indirectly being used for human consumption. Whether this skim milk should be so used or should be dried and used for direct human consumption is a question of economics and market possibilities for dried skim milk. Whether the skim milk can be dried is largely a problem of the size and geographical location of the farms where the skim milk is produced.

Nutrition and livestock specialists agree that except for feeding to young animals, skim milk would command a higher net return today if it could be manufactured into dried skim milk for direct human consumption.

The human consumption market for dried skim milk

The demand for skim-milk powder in time of war is far different from what it was prior to the war. It so happens that this is a product for which methods of manufacture and uses have had to be developed and a demand created. Contrary to the statement at the bottom of page 847 of the record of the hearings, the American Dry Milk Institute, of which, incidentally, National Dairy Products Corporation is not the largest member, has done an outstanding job in creating a market for dried skim milk. According to the institute's record, production of this product has increased from 16,463,000 pounds in 1916 to 399,294,871 pounds in 1942. Of the 1942 production, 361,486,271 pounds was for human consumption. The institute has never promised its fluid-milk members not to promote dry skim milk. In fact, its has tried to encourage and assist fluid-milk companies in attemps to market dried skim milk in retail packages. The Ewing-Von Allman Dairy Co., a fluid milk and ice cream subsidiary of National Dairy Products Corporation, located in Louisville, Ky., has tried without success to market dried skim milk direct to the housewife. The bakers, candy manufacturers, and ice-cream makers are as yet the largest commercial users of dried skim milk.

During much of the period of 1933 to 1941 more skim-milk powder was produced than could be profitably marketed and that was the reason the industry operated under the marketing agreement of the Agricultural Adjustment Administration, i. e., in an endeavor to bring order out of chaos in marketing the product.

Skim-milk powder manufacturing possibilities

Assuming that a skim milk powder market were normally available for all of the skim milk now fed to livestock, could we expect all of this skim milk to be dried immediately to supply this market? The answer is "No." The reason is simply that approximately 90 percent of the farms having milking cows in this country have less than 10 cows per farm and produce over half the milk that is produced. Seventy-two percent of the farms have less than 5 cows per farm and produce over one-fourth of the milk produced. Small herds are the rule in many areas in the Middle West where cows are kept as a part of a diversified system of farming, cream being shipped to the centralized creamery. These farmers are not prone to change their systems to one of whole-milk delivery and there isn't enough milk in a sufficiently small area to operate a creamery and milk-drying plant. Generally speaking, the eastern part of Kansas, Nebraska, Iowa, southern Minnesota, Wisconsin, and Michigan are the most promising locations for development of milk deliveries from the farm to factories and it is in these areas that through the system of priorities for building materials and equipment the production of dry skim milk is presently being extended.

The men most familiar with plant-procurement problems throughout the country are generally quite united that 25 percent of this milk at farms could be made into dry milk quite quickly with a favorable policy and price combination. Then working from there up, 50 percent of the farm production left at the farms would be more a matter of growth and development. Again, all depends upon policy and price for the finished products.

Industrial uses of skim milk

From what has been stated, it can be seen that prior to the war there was really a surplus of skim milk available for manufacturing purposes for which there was no profitable market as skim milk powder. Some of this skim milk was of unsatisfactory quality for human consumption skim-milk powder. Because of these facts, this skim milk found its way into other manufactured

Digitized by Google

products, notably casein. The following table showing the uses of skim milk for manufactured products in 1941 is taken from Production by States of All Manufactured Dairy Products, 1941, dated January 1943. This is a publication of the United States Department of Agriculture, Bureau of Agricultural Economics.

	Pounds
Full skim American cheese	7,000,000
Cottage, pot, and baker's cheese	1,172,000,000
Condensed and evaporated skim milk	1,519,000,000
Concentrated skim milk for animal feed	58,000,000
Dried or powdered skim milk	5,242,000,000
Dried casein	1,690,000,000
Total	9,688,000,000

It will be noted that approximately one-sixth of the skim milk used for manufacturing purposes was manufactured into dried casein. Casein manufacture has always had to stand on its own feet competitively and has provided a source of income to farmers that otherwise they would not have had. While National Dairy has never been in the button business, as the testimony indicates, some of its subsidiaries have manufactured dried casein for sale to various industries, notably paper manufacturers and in 1941 Aralac, Inc., a subsidiary of National Dairy Products Corporation, began the manufacture of Aralac, a substitute wool fiber which bids fair to find a large place in the manufacture of textile items. The casein used in this product does come from "skim milk residue" as quoted by Dr. DeKleine and when, as and if a more profitable market for the farmers' skim milk is developed, the skim milk for casein now being used in Aralac will go to that market. That is purely a question of economics.

KING COLLEGE,
Bristol, Tenn., April 30, 1943.

Senator HARLEY M. KILGORE,
United States Senate, Washington, D. C.

MY DEAR SENATOR KILGORE: I have received the copy of your science mobilization bill, S. 702.

I wish to say that I favor the passage of this legislation believing that it is in the national interest in this time of emergency and that its indirect effect will be to promote science and education.

Sincerely yours,

R. T. L. LISTON, *President.*

EXHIBIT No. 111

CHARLESTON, W. VA., *June 13, 1943.*

Hon. H. M. KILGORE,
United States Senator, Washington, D. C.

DEAR SIR: I received a copy of your bill, S. No. 702, for which I wish to thank you.

I believe that a department in the Government for the purpose of promoting scientific development would be beneficial to the United States in time of peace as well as war, and hope that the other Members of the Senate will give your measure favorable consideration.

Yours respectfully,

ROBERT MATTHEWS.

Washington, D. C.

DEAR SIR: Your letter of April 17, 1943, enclosing copy of the science mobilization bill (S. 702 and H. R. 2100), together with the statement summarizing its more important provisions, has reached my desk for reply. President Ashe, to whom your letter was addressed, is absent from the university on Government service. However, since the receipt of your letter here, the material which you forwarded to President Ashe has been turned over to the eight members of our science research council for their individual perusal, and it has been carefully read and discussed by other members of our staff in the scientific fields.

May we take this opportunity to commend your initiative in introducing legislation directed toward the improvement of our national scientific program.

Very truly yours,

W. J. HESTER, *Secretary.*

WELDING RESEARCH COMMITTEE OF THE ENGINEERING FOUNDATION

SPONSORED BY AMERICAN WELDING SOCIETY, AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS

NEW YORK, *April 30, 1943.*

Hon. H. M. KILGORE,
United States Senate, Washington, D. C.

DEAR SIR: We were very much interested in your bill S. 702 presented before the Seventy-eighth Congress. We assume, of course, that the proposed bill has in mind cooperation with the Office of Scientific Research and Development, the National Defense Research Committee, the Office of Production Research and Development of the War Production Board.

Insofar as civilians are concerned, no specific mention is made of the engineering societies of the United States. This committee represents the welding research committee of the American Welding Society and the other national engineering societies.

Digitized by Google

Welding, as you know, is one of the principal tools of production in ships, tanks, planes, guns, etc. We have gathered together the principal scientific talent of this country interested in welding research. We cooperate with the other Government departments mentioned above, but at times this cooperation is more like pulling teeth, and in many respects is one-sided. When such departments become interested in an investigation that we have started, they take over.

We are not complaining at all, and will cooperate with any new organization that is created. Personally, I am intensely interested in cooperative research, having spent the last 25 years as executive secretary of the Engineering Division of the National Research Council, and in recent years as executive secretary of the above committee.

Very sincerely yours,

W. SPRAGUE.

EXHIBIT No. 119

JOHNSTOWN COAL & COKE CO.,
Charleston, W. Va., June 10, 1943.

Hon. HARLEY M. KILGORE,
Senate Office Building, Washington, D. C.

DEAR SENATOR: Read with interest the Senate bill No. 702 and heartily agree with its purposes, for if anything has been badly butchered in the war effort it has been the misplacing of men into scientific and technical work, so many of whom are so poorly fitted.

For example, I only learned yesterday of a young man, in his late thirties, who was called via the draft, and during practically all of his business life was a grade-school teacher, and for some reason he never knew was placed in an engineering section and, as he said, he had never had any technical training and never knew what it was all about. Apparently, the Army became so disgusted with him they discharged him from the service.

Hope this bill will pass the Senate at a very early date so that the war effort may get the benefit of it.

Sincerely yours,

W. G. CRICHTON.

EXHIBIT No. 120

UNIVERSITY OF ARIZONA,
LABORATORY OF TREE-RING RESEARCH,
Tucson, Ariz., May 1, 1943.

Senator H. M. KILGORE,
Washington, D. C.

DEAR SENATOR KILGORE: I have your communication of April 23 and a copy of the bill on science mobilization. It seems to me a very desirable procedure. In the war situation, I have almost no time to look at points of special interest. I will find time to look at this further if possible.

By chance I heard recently a description of the institute of anthropology and of the bureau of Indian affairs in Mexico. It seemed to me there were some superb ideas there as to the connection between scientific research and government.

I have often considered the possible help that our work in tree rings and climate might get from governmental sources. Right now I am sure we could make a contribution along climatic lines if we had a certain type of material collected by, and only by, a skilled investigator such as my associate Mr. Schulman, in the mountains from the Mexican border to the Straits of Magellan. (I am not much expecting anything from tropical trees. The important regions are just outside the Tropics.)

Sincerely yours,

A. E. DOUGLASS.

EXHIBIT No. 121

SYNTHETIC RUBBER REPORT

Proposals of the International Federation of Architects, Engineers, Chemists, and Technicians, chapter 25, for (1) refinery conversion for quick butadiene; (2) immediate training of technical manpower for new rubber industry

BUTADIENE PRODUCTION

The synthetic rubber program for 1943 as established in the Baruch committee report is falling behind schedule. Rubber Director Jeffers and other officials concerned with the program publicly admit this fact.

I. New plants behind construction schedule.

On December 28, Director Jeffers stated that we were "one month behind the progress envisioned in the Baruch report." Since 4 months have elapsed since the Baruch report was issued, this delay of 30 days already represents a 25 percent delay in the program. It was stated in the Baruch report that a delay of 120 days in the succeeding year's program, or a delay of 33⅓ percent, would seriously jeopardize our military victory in the war against the Axis. The pres-

Digitized by Google

ent 25 percent delay is dangerously close to the point which the Baruch report warned would imperil our military victory. The situation is grave and no effort should be made to mask the seriousness of our position.

It is therefore necessary that we do not wait for the opening of the new butadiene plants, but that steps be taken to convert existing plants and equipment in order that we proceed without delay to the "quickie" butadiene process. This means to now increase by a substantial amount the butadiene production scheduled by refinery conversion processes. The delay in the entire program is due to delay in the new plants to manufacture butadiene from petroleum, the so-called permanent plants. These catalytic cracking and dehydrogenation plants require large tonnages of critical materials, and priority difficulties are given as the reason for the delay in their construction. But the priority system cannot solve the problem of raw material shortages in the absence of real production scheduling; and, therefore, the mere assignment of priorities will not build these plants in time.

There is evidence before the Gillette committee that the construction of more than one of the new butadiene plants is behind schedule. For example, Assistant Deputy Petroleum Coordinator Bruce K. Brown was unable to inform the Gillette committee whether Standard Oil's 6,200-ton-a-year butadiene plant at Baton Rouge was in operation, although this plant was due to go into production last September. (Brown is a Standard Oil of Indiana executive, who, while being paid $9,000 per year by the Government, is receiving the balance of his salary from Standard Oil.) The largest butadiene plant under construction is that of Shell Chemical in southern California with an annual capacity of 85,000 tons, and it is doubtful if this plant will start operations as scheduled in March 1943.

New technical difficulties in the Standard-Shell process of butadiene manufacture for the southern California plant have arisen within the past week, and no satisfactory solution is in sight at the present time. This condition is symptomatic of all butadiene from petroleum plants, and mere completion of construction is no guarantee of successful operation.

It should be pointed out that no new chemical process works out as scheduled, particularly a process as untested and large in scope as the Standard butadiene from petroleum process. The experience of the small Shell butadiene plant in Texas indicated a delay of some 10 months before capacity production was attained.

. . . .

It is apparent, then, that much greater reliance must be placed on the production of butadiene by the refinery conversion processes.

II. Refinery conversion for "quick butadiene" now.

The refinery conversion program as set forth in the recommendations of the Baruch report called for 120,000 tons annual capacity of "quickie" butadiene production. This quota was set by the Baruch committee in spite of the fact that its own technical experts were of the conviction that 200,000 to 400,000 tons could be produced by conversion. In view of the present critical situation, the quota set must be scaled upward by a considerable amount. The refinery conversion processes utilize existing refinery equipment and salvage equipment, and require only a small expenditure of new, critical materials. The butadiene production to be achieved by a utilization of these processes should be regarded not only as production output required for a given time schedule, but also as a method for insuring the production of the new plants.

Furthermore, the annual capacities in terms of tonnage and completion dates are liable to be misleading. Actually, the average plant will produce nothing the first month after completion, about 20 percent of capacity the second month, 40 percent the next month, 60 percent the next month, and 100 percent the fifth month. Thus, a period of at least 5 months elapses after the completion date before capacity production is reached.

These facts should make plain the critical need of an expanded refinery conversion program for the production of butadiene. If the program is expanded now without further delay, considerable butadiene can have been produced by September 1, 1943, the expected low point of rubber supply.

Refinery conversion processes include the Houdry process of utilizing catalytic cracking equipment for the production of butadiene in a two-stage dehydrogenation process using normal butane as feed stock, and thermal cracking processes using naphthas or low octane gasoline fractions as food stock. In the latter process yields of butadiene are low but existing thermal cracking equipment can be readily converted. The purification of the butadiene can be accomplished by the

Digitized by Google

Shell "vapor phase" extraction process or the Standard selective chemical reaction process. If the Shell "vapor phase" purification is adopted, large quantities of critical materials can be saved and the basic equipment necessary is found in all refineries. Both types of conversion have the additional advantage that butylenes also badly needed for the aviation gasoline program are not required for feed stock, thus avoiding potential conflict in the requirements for high-octane aviation fuel.

Why, then, has the refinery conversion program been delayed? On January 6, 1943, the assistant deputy petroleum administrator told the Gillette Senate Investigating Committee that delay to obtaining official sanction for conversion of refineries to produce butadiene has impeded the rubber program. He stated that if the plant conversions had been started at the time the refiners and natural gasoline manufacturers first proposed them, the plant would have been in operation "many months prior to the best completion date which can be predicted for a wholly new plant." From whence stems the resistance to the conversion program?

III. Opposition to conversion threatens success of war.

We submit that the opposition to this program of conversion of existing facilities stems from the same monopoly of petroleum interests headed by Standard and Shell as was originally responsible in large part for the sabotage of the superior processes using ethyl alcohol as feed stock, as well as the sabotage of the Russian offer of technical assistance. These are the same interests that have sonspired with I. G. Farbenindustrie to prevent the production of synthetic rubber in this country. In 1941 Goodrich Rubber developed their own process for synthetic rubber and Standard Oil filed suit for infringement of one of the I. G. Farben patents. It would be well to recall that this suit was pending at the time when the Axis struck at Pearl Harbor.

Any program which threatens the post war dominance and monopoly of the large petroleum corporations and corporation combines can expect to meet ruthless and completely selfish opposition. Not only do the new Government-financed plants enormously increase the total assets of the petroleum corporations, but the entire existing refining capacity is retained intact for immediate use after the war. The monopolistic oil interests oppose the inclusion of independent, small refiners in the synthetic-rubber program.

Oil Workers International Union Local 449 of Texas City points out that "it is precisely these people who now withhold the licensing of basic patents for production by independents." This corporate selfishness and total disregard for the demands of military necessity is not only completely reprehensible, but if not checked will seriously imperil the success of the war. We submit, therefore, that the refinery conversion program should be accelerated with particular emphasis on including small, independent refineries.

IV. Program for California.

Specifically, for the northern California area, we propose the following:

1. One out of the four large petroleum refineries in this area (Shell, Standard, Associated, and Union) should convert all equipment capable of conversion to the manufacture of butadiene for synthetic rubber. The additional feed stock required could be furnished by the other three refineries involved.

2. If this conversion should occasion a loss of aviation gasoline output in this refinery, it is proposed that corrective steps be taken to proportionately increase the output of aviation gasoline constituents in the other three refineries concerned.

3. A study should be made to determine which refinery is best adapted to conversion and which process is most advantageous for maximum production in the shortest possible time.

It has been recently reported that two conversion projects using the Houdry process had been approved for California. However, these projects are to replace "permanent" projects which have been dropped, and therefore do not increase the total production of butadiene. The Baruch report pointed out that refinery conversion projects were intended to add to and not replace the so-called permanent plants. It should be reiterated again that refinery conversion projects should be instituted in California to provide extra butadiene capacity, both to meet the production schedule and as insurance for the production of the entirely new plants.

This program of refinery conversion for the northern California area may be extended to each oil-producing area and thereby accelerate the refinery conversion program to provide sufficient butadiene for the 1943 requirements of syntheic rubber.

Digitized by Google

V. Aviation gasoline production need not suffer.

It has been stated that where the aviation gasoline and synthetic rubber programs come into conflict that the aviation gas program must take precedence. Steps whereby such conflict can be avoided have already been indicated. However, can it be that this argument on the greater importance of aviation fuel results from that school of military strategists which states that the war can be won by aviation alone? It should be clear that the invasion of Europe promised by President Roosevelt in his message to Congress relies upon adequate and guaranteed supplies of synthetic rubber within the next few months for modern, mechanized equipment. We cannot base military offensives on rubber we do not have.

Unless the success of our synthetic rubber program is guaranteed, the appeaser defeatist forces will be sure to seize upon this situation as reason enough to withhold the military offensive against the Axis Powers and an early invasion of continental Europe.

DEARTH OF TECHNICAL MANPOWER FOR THE SYNTHETIC RUBBER PROGRAM

As serious as is the present problem of a butadiene production schedule, even more potentially serious is the problem of recruiting and training sufficient technical and semitechnical manpower to insure the successful operation of these plants. A startling admission by Deputy Rubber Administrator Colonel Dewey before the Gillette Senate committee December 16, 1942, was that the latest bottleneck in the rubber program was the problem of the technical manpower required to operate the complicated butadiene, styrene, and copolymerization plants.

VI. Training technical manpower now vital.

Here we are expecting to operate a new chemical industry in which the Government has invested upward of $650,000,000 to produce 800,000 tons of synthetic rubber per year. Altogether there is a mere handful of trained men who have had even a limited experience in manufacturing butadiene or similar products. We can estimate a minimum of 10,000 chemists, engineers, technicians, and plant operators will be required, and yet we see no visible steps in training men and women for these posts. The efforts of the Federation of Architects, Engineers, Chemists, and Technicians in California through labor-management committees to induce interested leading petroleum companies to institute a special training program have been balked thus far. Yet these companies have on their present staffs trained technicians, operators, and engineers who with a minimum of training could be equipped to step quickly into butadiene plant positions of responsibility.

VII. Business-as-usual policy must be rejected.

What then, is being done to solve this vital and pressing problem? Each company is applying its old peacetime thinking to this problem, with the result that no adequate or coordinated program of training exists. For the most part these companies have demonstrated that they are not even aware of the extreme urgency of the technical manpower shortage.

As an example of the present approach to this problem, the Shell Chemical Co., which is to operate the largest butadiene plant in the entire rubber program, has selected one of its chemists and sent this chemist out to familiarize himself with plant practice. Otherwise this company is requesting applications from chemists with no rubber experience.

Another example is one of the largest research laboratories in the country which is well acquainted with the butadiene problem. This company employs a staff of from 600 to 700 scientists and technicians, and yet less than 10 percent of this staff is concentrated on butadiene problems. This company with its business-as-usual attitude is not only not adding to the staff number working on rubber, but is actually taking highly trained rubber chemists off rubber work for nonessential war work on paints. Other research units are working on the far-fetched problem of finding uses for butadiene for the post-war period before we have mastered the manufacture of butadiene for pressing military neds.

VIII. Seek rubber industry council with labor-management-government representation.

A positive, coordinated plan on both a regional and national scale must be accomplished through joint labor-management-government cooperation. All the

Digitized by Google

trade unions involved in the rubber program, Federation of Architects, Engineers, Chemists, and Technicians, Oil Workers International Union, United Rubber Workers, and the companies, and representatives of the War Manpower Commission should jointly work out this training program. These agencies should endeavor to secure as many qualified technicians and operators as can be spared from the petroleum and allied chemical plants and laboratories. It is obvious that this problem cannot be solved by any one company alone. If in the Standard Oil and Shell laboratories of California there are today from 1,500 to 2,000 highly trained technicians, surely 500 of these could be commandeered to prepare themselves to man the new butadiene and rubber plants.

The Federation of Architects, Engineers, Chemists, and Technicians recently approached the Office of the Rubber Director with proposals to insure training of technical personnel. The answer received from the Office of the Rubber Director stated, "If, therefore, you will furnish me with a list of men trained in technical fields related to that of synthetic rubber with a brief notation of their training, experience, and qualifications, I shall be glad to bring it to the attention of those concerned with manpower problems in the several plants and laboratories."

This attempt at piecemeal solution of a problem as large in scope as this problem of training sufficient technical manpower for an entirely new industry will not succeed. This problem is much easier solved by a planned utilization of the tremendous potential capacities of the existing petroleum company research laboratories.

Our plan is to receruit the necessary number of men and women and to begin training them immediately. In the past it has been the policy of large companies to hoard technical manpower and to prevent their release to plants and laboratories of other companies in the same or allied fields. Further, the technical manpower from nonessential industry, for example from the cosmetic and pseudopharmaceutical industry, must be released for work in the synthetic rubber program. A large number of organic chemists would thus be made available for essential research and development work in synthetic rubber.

IX. Program for California.

Specifically for the northern California area we propose the following:

1. A special intensive course in rubber technology should be given in conjunction with the University of California's wartime training program. Outstanding experts from the Rubber Director's Office should be assigned to conduct this course. All chemists and engineers in the area with any experience in research or development in synthetic rubber, as, for example, the butadiene and rubber research personnel at the Shell and Standard laboratories and plants, should attend this course.

2. This personnel should be expanded by the transfer to rubber problems from less important work of sufficient chemists and engineers to adequately staff all synthetic rubber plants in the California area.

3. This special course in rubber technology should be followed by a period of in-service plant training to be given in the first butadiene, styrene, and polymerization plants to be completed in California. This should include in-service training in the refinery plants converted to butadiene manufacture.

4. This technical personnel would then be qualified to take charge of further on-the-job training in plants and laboratories and would function as "technical commandos" to solve operating problems and "bugs" in the synthetic rubber plants whenever and wherever they may arise.

5. Selective service should reconsider the cancelation of occupational deferments for trained technicians and the utilization of these technicians for the rubber program.

SUMMARY

In the above report we have discussed two phases of the synthetic rubber program: The production of butadiene by refinery conversion processes and the training of technical manpower for this new industry. These are two of the most pressing problems facing us today. To insure the successful operation of the plan outlined above, a joint labor-management-Government committee for synthetic rubber should be instituted. This committee should have representation from the Federation of Architects, Engineers, Chemists, and Technicians, the Oil Workers International Union, and the United Rubber Workers of America. This would be in line with the Congress of Industrial Organizations-Murray plan, and the committee set-up would function as a synthetic rubber industry council, with American labor, chemists, technicians, oil and rubber workers given a responsible voice in carrying out the program.

Digitized by Google

OUTLINE OF SPECIAL COURSE IN SYNTHETIC RUBBER TECHNOLOGY

A. Technical manpower needed:

The following categories of technical manpower and womanpower will be urgently needed for the synthetic rubber program:

1. Rubber chemists and engineers.
   This classification would consist of graduate chemists and engineers, and preferably chemists and engineers with experience in petroleum, rubber, or allied fields.
2. Plant operators.
   These men and women should be mechanically inclined, with some background in chemistry or physics.
3. Laboratory technicians.
   These men and women will run the laboratory control operations, will test the intermediate and finished products according to standard and special tests.

B. Outline of courses needed:

1. Courses for rubber chemists and engineers.
   - A. Butadiene production and recovery:
     - Butadiene production:
       1. Introductory review of problem and various processes.
       2. Thermodynamics:
          - Thermodynamic relationships between hydrocarbons.
          - Heats of reaction.
          - Heat capacities of gases and solids.
          - Equilibria in dehydrogenation reactions.
       3. Thermal cracking of hydrocarbons:
          - For gasoline.
          - For aromatics.
          - For butadiene and other olefins.
          - Technical problems in high-temperature cracking processes.
          - Thermal secondary reactions of butadiene.
       4. Catalytic dehydrogenation of butylenese and butane:
          - Theory of contact catalysis.
          - Practical aspects of catalysts—poisoning carbonization, aging, regeneration.
          - Means of effecting catalytic reactions.
          - Reactor design.
          - Sources of butylenes and butane.
          - Preparation of feeds for catalytic dehydrogenation.
          - Catalysts and process for butane dehydrogenation.
          - Catalysts and process for butylenes dehydrogenation.
       5. Analytical control:
          - Sampling of gases from cracking processes.
          - Methods of analysis.

THE RECOVERY OF BUTADIENE

Introductory.

The recovery of butadiene is essentially the separation of the butadiene from butylenes and butanes. Unfortunately the physical properties of the compounds are very similar which makes the separation problem a complex and difficult one.

The separation processes used in the various plants involve distillation, solvent extraction, and a combination of distillation and extraction. It is therefore essential that the men who are to help operate the recovery plants have a clear understanding of these methods of separation.

However, the problem is much more complex than simple distillation or extraction might indicate. Due to the similarity of the compounds the separations

Digitized by Google

are very difficult. Therefore, equipment and controls which a few years ago were thought impractical are now essential.

The men responsible for the operation of these plants must therefore understand instrumentation and the need of close control of the units in order that the maximum amount of butadiene be produced. Where the petroleum industry has been used to thinking of cut points in terms of degrees it must think now in terms of tenths of a degree.

The following subjects should therefore be included:

1. Theory of distillation.
2. Theory of solvent extraction.
3. Theory of combination distillation and extraction.
4. Instrumentation.
5. Correlation of laboratory analysis with plant operation.

B. Polymerization and Compounding of Synthetic Rubber.

I. Production of crude rubber.

A. Natural rubber.

1. Historical aspects relating to the early discovery and utilization.
2. A discussion of the different varieties which have been used or which have been proposed for us in the past and in the present emergency. (For example hevea, landolphia, manihot, crypsostegia, guayuale, castailloa, kok sayz and so forth.)
3. A description of the methods of cultivation of these various plants.
4. A description of the processes of harvesting the rubber such as the tapping, gathering and plant harvesting methods.
5. A description of the recovery of and the methods of preparing the rubber for market (i. e. coagulation, creping, sheeting, drying, smoking of latices, and the recovery of rubber from plant tissue and grading, packaging, and handling).

B. Synthetic rubber.

1. Historical development of the making of synthetic rubber.
2. A detailed discussion of the methods of conducting the polymerization of the monomeric materials by both the bulk and emulsion procedures. It is important that a thorough knowledge of the role of emulsifying agents, catalysts, regulators, buffers, solvents, impurities, conditions, monomers, and other components—what they play in the quality and properties of the products—this knowledge should be acquired. Knowledge of the methods used in the production of neoprene, thiokol, butyl, butadiene, and butadiene copolymer should be of substantial benefit in acquiring a view of the field as now practiced.
3. Discussion of the methods of coagulation, washing, drying, and packaging.

C. Rubber substitutes:

1. To acquaint the public with the possibility of making use of the less critical materials of this class to replace rubber wholly or in part, a summation of the properties that go to make up a rubbery material and designation of those materials which may possess these properties to a variable extent would have much value. Materials of this class may be represented by Agripol, plasticized cellulose acetate, polyvinyl resins, Vistanex, lactice, and certain rubber extenders.

D. Reclaiming of rubber.

1. A discussion of the various methods of reclaiming rubber and the machinery used therein.

Digitized by Google

B. Polymerization and Compounding of Synthetic Rubber—Continued.
I. Production of crude rubber—Continued.
E. Rubber derivatives.
1. The derivatives should be discussed as to the processes and techniques used in their manufacture and the increasingly wide use for special purposes. Materials such as rubber hydrochloride, chloro-rubber, cyclo rubber, and oxidation products may act as examples.
F. Hard rubber.
1. A discussion of the methods of making, the uses of and the properties of ebonite.
II. Practical compounding of natural rubber, synthetics, substitutes, and latex.
A. A discussion of the materials that are used in compounding the rubber. They should be discussed as to their properties and the properties which they confer on the material being milled, stored unvulcanized, vulcanized, and/or the vulvanized product. Materials representative of this class are the rubbery materials, vulcanizing agents, vulcanization accelerators, antioxidants, fillers, reinforcing agents, plasticizers, softeners, pigments, abrasives, extenders, and others which are commonly used in practice.
B. A discussion of the methods of mixing and the machinery used for this purpose. Describe the roles of break-down, masterbatching, order of addition, etc.
C. Aging and processing of the compounded materials to produce the unvulcanized useful product. Describe in detail the calandering, extruding, tubing, and building up of the material.
D. Describe the molds and vulcanizing techniques.
III. Physical testing of the raw rubber, compound, or vulcanizate.
A. A discussion of the methods and significance of the various tests which are conducted.
B. A detailed discussion of the various chemical tests and of the tests and measurements of dimensions, specific gravity, tensile strength, ultimate elongation, or the stress strain, characteristics, compression strength, and the relation of load to deflection, hardness, resilience, permanent set, color, dielectric strength, coefficient of friction, aging, adhesion, abrasive resistance, tearing, cutting, and of fatiguing tests using extensions compression or flexing. Include also the methods and machinery for conducting the tests.

To supplement and give better understanding to the more practical problems heretofore presented, a certain amount of basic theory in certain phases of theoretical rubber chemistry and physics is in order. The fields or subjects which may be of most use are as follows:

1. Composition of the crude rubbery material, latices, etc.
2. Physical and chemical properties of the same.
3. Molecular structure and the means of determination.
4. Polymerization theory for the synthetics and substitutes.
5. Effects of masticating natural and synthetic rubbers. Also the physical and chemical changes involved.
6. Structure and behavior with regard to solvents.
7. Theories and phenomena of all types of vulcanization.
8. Theories and uses of vulcanization accelerators.
9. Fillers and reinforcing agents, their effects, uses, and the results of study on them by means of the electron microscope.
10. Deterioration of rubber in general and the materials or conditions which accelerate or inhibit the process.
11. Electrical behavior of the rubbers and ebonite.

2. *Course for plant operators:* Course to be built around operating techniques of petroleum cracking equipment, distillation equipment, etc. Course details to be determined as noted later.
3. Course for laboratory technicians.

Digitized by Google

COURSE FOR LABORATORY TECHNICIANS

Introductory.

I. The methods used in a control laboratory for butadiene production will not differ from those used in the usual laboratories controlling cracking plants. Both will require a great deal of gas analysis.

II. Since women will comprise the majority of the workers, the training course should be designed to provide the background of mechanics and mechanical manipulation.

III. The following should be included:

A. Instruction in the principles of low-temperature fractionation.

B. Instruction in the principles of absorption gas analysis.

C. For (A) simple demonstration, equipment should be devised to illustrate (1) the action of a fractionating column; (2) methods used for measuring gases; (3) gas calculations; (4) application of 1 and 2 to fractionation of liquefied gases.

D. For (B) equipment should illustrate (1) demonstration of absorption gas analysis methods; (2) particular application to hydrocarbon analysis.

C. Proposals to start the training and coordinate the program on a Nation-wide basis:

The problem is too large for one person.

A committee of 3 to 5 people must start finding material for technical training at once.

The committee will consist of (1) a coordinator (full time); (2) one or two travelers; (3) one or two rubber chemists.

Duties of these people:

The travelers will contact as many plants as possible where synthetic rubber is being produced. They must be armed with Government permits to get inside of these plants, factories, or laboratories. They also will visit as many training centers as possible to find out what is being done elsewhere.

The territory covered should be all (if possible) the centers in the United States where the problem of rubber is being investigated.

After visiting a place, a report should be sent to the coordinator at once. The report should contain the following information:

1. The name, nature, description of tests conducted.
2. List of special equipment and apparatus needed.
3. Where are the directions available.
4. What references are used.
5. Length of time spent in laboratory.
6. To whom does the coordinator write for more information—name and title.
7. How cooperative was the laboratory in giving the information.
8. Some evaluation of the plant visited as to efficiency, etc.

The reports should be detailed and explicit.

After a few visits, a check list can be made to facilitate correspondence. The coordinator should have a complete itinerary.

The coordinator (full-time position):

1. Without delay the coordinator should start to correspond with all places that have in the past, or are now doing training for synthetic rubber.
   (*a*) Find extent of course.
   (*b*) Course context.
   (*c*) Equipment needed.
   (*d*) Get outlines of these courses.
2. Summarize reports of travelers and correlate the above material with reports.
3. Consult with rubber chemists—
   (*a*) After each report comes in.
   (*b*) To outline courses of instruction.

The rubber chemists: These men must be experienced with the problem (*a*) either formal college organic majors, or with equivalent in experience and research; (*b*) laboratory experience in rubber—with some experience in pilot-plant work.

These men will be able to evaluate the reports of the travelers. These men will be able to outline the courses of instruction at the various levels.

Digitized by Google

D. Courses of instruction—general:

There will be at least three different courses:

1. A course for chemists and engineers.
2. A course for plant operators.
3. A course for laboratory technicians.

The course for chemists and engineers to be conducted—or at least started—by the rubber chemists.

Jeffers is to be contacted for men who are experts in the field. These men should be asked to give some phase of this course on the west coast.

The course for plant operators: This course to be exactly determined by the reports of the travelers. As soon as reports come in and are evaluated, the course starts. As more reports come in, the course is expanded.

The course for laboratory technicians: This course to give instruction in laboratory control operations and to be given by chemists with special knowledge of this phase.

E. Place of instruction for California area:

The courses should be authorized by E. S. M. W. T. and given at University of California, and to be followed up with on-the-job-training in the first plants to come into operation.

EXHIBIT No. 122

DENISON UNIVERSITY RESEARCH FOUNDATION,
Adrian, Mich., April 26, 1943.

Senator HARLEY M. KILGORE,
Washington, D. C.

DEAR SENATOR KILGORE: President Kenneth I. Brown, of Denison University, has sent to me literature including copy of S. 702.

President Brown and I have been closely associated in founding the Denison University Research Foundation. Dr. Brown also is familiar with the fact that the writer has spent several years in attempting to interest his government in establishing a National Research Foundation to care for the multitude of problems our country is now and will continue to face—I hope realistically. It would seem that the matter in this bill you are sponsoring covers very much the same ground that I have been emphasizing in my attempts to interest Congress.

I have already approached Vice President Wallace and have received a sympathetic reply, but no tangible evidence that I might expect anything more. Also our Congressman from this district, Mr. Earl C. Michener, has been approached by letter and personal interview, but I have the feeling his interest in the matter was practically nil. He implied he was too busy with war work to give the matter any attention at this time. I think time will show that Mr. Michener (a personal friend) is 100 percent wrong about both the being busy and the time. If ever there was needed what your bill and my own attempts imply, that time is certainly now. Mr. Michener has in his files some material sent him long since and which I asked him to hand to anyone interested. Perhaps it is still in his desk.

There is no connection whatever between the Denison Foundation and the National of which I write. However, I am sending you a little pamphlet concerning the one and a few excerpts copied from my previous correspondence so that my own thoughts in the matter may be clear. I am especially pleased with your sections 1, 2, 3, 6, 8, 9, 12.

If you so desire, this letter may be taken as a very cordial endorsement of this bill. I only hope that our representatives in Washington may be as alive to the needs of our country as are some of us whose names are unknown and whose opinions are brushed aside with reckless abandon. In the opinion of this writer, we are using but a small fraction of our national capabilities—and are tardy in the use of this fraction.

Kindly,

ELMER M. JONES.

EXHIBIT No. 123

BROTHERHOOD OF RAILROAD TRAINMEN,
Cleveland, Ohio, January 25, 1943.

Hon. H. M. KILGORE,
Chairman, Subcommittee on Technological Mobilization,
Senate Office Building, Washington, D. C.

MY DEAR SENATOR: I enclose herewith a photostat copy of a letter dated January 20, addressed to me by Mr. C. H. Sullivan, our New York State legislative representative, together with the enclosure to Mr. Sullivan's letter, pertaining to testimony given before your committee by Waldemar Kampffert, science editor of the New York Times, which testimony will be found on pages 78–79, volume 1, of the hearings before your committee.

You may note from Mr. Sullivan's letter that Mr. Kampffert's testimony is apparently not based on facts.

With best wishes I am,
Sincerely yours,

A. F. WHITNEY, *President.*

BROTHERHOOD OF RAILROAD TRAINMEN,
Albany, N. Y., January 20, 1943.

Mr. A. F. WHITNEY,
President, Brotherhood of Railroad Trainmen,
Cleveland, Ohio.

DEAR SIR AND BROTHER: This will acknowledge receipt of your letter of December 3, 1942, with copy of a portion of the testimony about the United States Senate committee holding hearings on S. 2721, given by Mr. Waldemar Kampffert, science editor of the New York Times, wherein the gentleman states that in New York we have a law which makes it necessary for three men to be in a steam engine locomotive, that was passed after an engineer had died at the throttle of heart failure.

My delay in answering your communication on this subject matter is due to the fact that I wanted to make an extensive investigation on various railroads in the State of New York for the purpose of ascertaining if any railroad did use three men on a steam locomotive, and in my investigations I am not able to find any place where three men are employed in this capacity. Therefore I believe the statement made by the gentleman before the Senate committee is untrue.

On all steam locomotives in the State of New York, and also Diesel electrics, there are employed one engineer and one fireman. The only place where the third man would be required would be when the engine runs light outside of yard limits; then a flagman is placed on this engine for the purpose of throwing switches and flagging against trains over the division.

Before making my reply to you I checked with representatives of both the engineers and firemen and find my statement to be true and accurate, and I am attaching to this letter a copy of section 54 (a) of the railroad law of the State of New York, for your information and ready reference.

Hoping this is the information desired, with best wishes, I am,
Fraternally yours,

C. H. SULLIVAN,
State Legislative Representatives.

GENERAL—ALL COUNTIES

LAWS OF NEW YORK—BY AUTHORITY

CHAPTER 290

AN ACT To amend the railroad law, in relation to train crews.

[Became a law April 21, 1921, with the approval of the Governor. Passed, three-fifths being present]

The People of the State of New York, represented in Senate and Assembly, do enact as follows:

SECTION 1. Section fifty-four-a of chapter four hundred eighty-one of the laws of nineteen hundred and ten, entitled "An act in relation to railroads, consti-

Digitized by Google

tuting chapter forty-nine of the consolidated laws," as added by chapter one hundred and forty-six of the laws of nineteen hundred and thirteen, is hereby amended to read as follows:

"§ 54-a. FULL CREWS FOR CERTAIN TRAINS. No person, corporation, trustee, receiver, or other court officer, shall run or operate, or cause to be run or operated, outside of the yard limits, on any railroad of more than fifty miles in length within this state, a freight train of more than twenty-five cars, unless said train shall be manned with a crew of not less than one engineer, one fireman, one conductor and three brakemen; nor any train other than a freight train of five cars or more, without a crew of not less than one engineer, one fireman, one conductor and two brakemen, and if the train is a baggage train or a passenger train actually carrying baggage, without a baggageman in addition to said crew; nor any freight train of twenty-five cars or less without a crew of not less than one engineer, one fireman, one conductor and two brakemen; nor any light engine without a car or cars, without a crew of not less than one engineer, one fireman and one conductor or brakeman. Each separate violation of the provisions of this section shall be a misdemeanor punishable by a fine of not less than one hundred dollars nor more than five hundred dollars. Each train or light engine run in violation of the provisions of this section shall be deemed to be a separate offense."

§ 2. This act shall take effect immediately.

STATE OF NEW YORK,
Office of the Secretary of State, ss:

I have compared the preceding with the original law on file in this office, and do hereby certify that the same is a correct transcript therefrom and of the whole of said original law.

JOHN J. LYONS,
Secretary of State.

EXHIBIT No. 124

CHEMICAL ARTS FORUM,
Chicago, Ill., April 21, 1943.

HON. HARLEY M. KILGORE,
Chairman, Subcommittee on Technological Mobilization,
Committe on Military Affairs, United States Senate,
Washington, D. C.

MY DEAR SENATOR: We wish to thank you for the copies of bill S. 702, which were so generously supplied in order that our members could discuss the bill and the ideas that were apparently behind the drafting of it.

We have held an executive session of our membership and have discussed this subject at length. By the unanimous vote of the quorum present, this committee has been instructed to convey to you the feelings of our organization. This letter has been read to the membership and has been passed by them as expressing their collective opinion.

Our organization is made up of technical executives, research directors, and research and development chemists and engineers. We therefore are well acquainted with technical men and their problems. Bill S. 702 fails completely to understand either the technical men, or their problems. Neither does it further the sound technical progress of the Nation, either during wartime or peacetime.

In discussing this bill, page by page, and point by point, it is apparent that its provisions could only be detrimental to the technological progress of our Nation. History has shown, and our own experience has confirmed, that regimentation is particularly harmful to technical progress. Untrammelled freedom of action and individual initiative best provide the fertility for rapid and sturdy technical advancement.

Bill S. 702 is wholly undesirable, and its enactment would harm the Nation greatly. Knowing technical men and technical problems, this bill would be incapable of enforcement.

Respectfully,

ROBERT E. ELLIOTT,
Chairman, Committee on Bill S. 702.

Digitized by Google

EXHIBIT No. 125

Mr. ROBERT S. ELLIOTT,
Chairman, Committee on Bill S. 702,
Chicago, Ill.

DEAR MR. ELLIOTT: I am interested in what you have to say about this bill, most particularly in the paragraph which I am now quoting:

"History has shown, and our own experience has confirmed, that regimentation is particularly harmful to technical progress. Untrammelled freedom of action and individual initiative best provide the fertility for rapid and sturdy technical advancement."

We therefore seem to have exactly the same ideas on this subject and testimony before the committee has curiously brought out the fact that this bill may liberate many scientists from the regimentation that now exists not alone in our major monopolistic industries, often circumscribed by cartel and other agreements, but also in some of our technical societies. Fortunately for the development of technology in this country, there are many independent scientists and technicians whose efforts might well be stimulated by an agency such as is proposed in bill S. 702.

Hearings have demonstrated that much progress could be made in the technological advancement of this country if a free access to facilities and personnel were made available to these many independent scientists. It is for the purpose of supplementing the already splendidly developed technological research divisions of large industry that this bill was designed. If the committee felt that the fullest development of our technology could be safely left in the hands of the few, this bill of course would have little value, but it has been demonstrated in this intensive period of war preparation that many of our best defense ideas came from without the industry directly interested. It emphasizes the feeling the committee has had that this condition not alone prevails during wartime, but during peacetime as well.

Having in mind that competition in this world of the future lies in our ability to make the broadest and fullest use of our technological advance, this bill is aimed to so coordinate rather than regiment the science of the future that we may well meet that competition in the post-war period.

Sincerely,

H. M. KILGORE,
United States Senator.

EXHIBIT No. 126

SHALL RESEARCH BE SOCIALIZED?

The Kilgore Bill (S. 702) Analyzed by the National Association of Manufacturers
(Pamphlet Issued May 1943)

Pending in the United States Senate is S. 702, entitled "a bill to mobilize the scientific and technical resources of the Nation, to establish an Office of Scientific and Technical Mobilization, and for other purposes." Hearings on it are being held before a Subcommittee on Technological Mobilization, specially formed within the Military Affairs Committee. Senator Harley M. Kilgore (Democrat, West Virginia) is chairman of the subcommittee. A companion bill (H. R. 2100) has been introduced in the House by Representative Wright Patman (Democrat, Texas), and it has been referred to the Committee on Patents.

Analysis of S. 702 reveals that it presents a comprehensive plan for the most ambitious project to socialize industrial research and technical resources that has ever been proposed in the United States Congress.

The bill is based on the assumption that there is now an "absence of an effective Federal organization to promote and coordinate, in the national interest, scientific and technical developments," and that there must be Federal control and coordination of the scientific and technical facilities, personnel, and resources of the United States "for the effective prosecution of the war and for peacetime progress and prosperity" (sec. 1).

Twelve purposes to be accomplished are set forth, among which are complete Government direction, planning, and control of—

(*a*) What are described as "scientific and technical facilities" including every form of property either used or intended for scientific or technical purposes includ-

Digitized by Google

ing patents, inventions, processes, methods, designs, specifications, and all "know how" used or intended to be used for scientific and technical purposes either in research or in supplying war or civilian goods or services (sec. 2 (a)).

(*b*) "Scientific and technical personnel," including all persons, except physicians and dentists, who have completed college or university studies in any branch of science or have had not less than 6 months' training or employment in a technical vocation (sec. 2 (b)).

Whenever the word "agency" or "establishment" is used it means not only Federal or State agencies but private firms or corporations and schools or colleges (sec. 2 (c)).

The act is to be executed through what is termed the "Office of Scientific and Technical Mobilization" which is directed by a salaried administrator appointed by the President and serving at pleasure, who appoints such officers and employees as he deems necessary within a preliminary appropriation of $200,000,000 and a revolving fund from properties under his control (sec. 3 (a), and sec. 9 (a)). He has at his service a "Board" and a "Committee" who perform such duties as he determines (sec. 3 (c), (d), (e)).

AN ADMINISTRATIVE DICTATOR

This administrator is given enormous power to make the act function, including the authority—

(*a*) To take and keep a census of scientific and technical facilities and personnel hitherto defined, to formulate projects and programs for their use and development, to train the personnel, and to appraise the relation of scientific and technical developments to the national welfare; also to solicit private support to these ends (sec. 4 (a) to (e));

(*b*) to foster international cooperation, and to arrange the reciprocal exchange of scientific information and personnel (sec. 4 (g));

(*c*) to review the specifications, standards, and designs of military and civilian products, also the methods of production and supply (sec. 4 (i));

(*d*) to finance in any way the purchase of any kind of property used or intended for scientific purposes, and to make contracts in the execution of his powers (sec. 4 (j)).

POWER OVER PATENTS

The bill provides for vesting in the office exclusive rights in inventions which have heretofore resulted or shall hereafter result from research or inventions to which the Government has contributed since May 27, 1941, or shall hereafter contribute, "any money, credit, physical facilities, or personnel" (sec. 7 (a)). This is directly opposite to the constitutional provision for granting to inventors "the exclusive right to their * * * discoveries."

By not limiting the inventions to be taken to those having "public use" interest, inventions are included in which the Government, as such, could have no possible interest and with respect to which the Government would not properly be exercising any right of eminent domain. The provision made for compensation for such taking is unsatisfactory (sec. 7 (d)).

The office would be provided with means by which it may acquire complete information regarding projects and developments under way within industry as well as among independent inventors (sec. 1 (4), (6); sec. 4 (a), (b); sec. 8 (a); and sec. 10). It could then destroy the fruit of the labors of those from whom the information was acquired by having the Government itself develop or turn the project over to someone else to develop, thereby vesting the completed invention in the office (sec. 1 (6); sec. 4 (b)). No redress would be available to the one who originally furnished the data on which the invention was developed.

In vesting exclusive patent rights for the present as well as the future in the office, the Government would be put in a position of necessarily entering into extensive interference and infringement litigation with industry and with individual inventors involving their conflicting interests in the respective inventions.

This provision for the vesting of exclusive rights in the office ignores the incentive given to inventors by the Constitution to encourage invention, and also ignores the incentive given to speculative capital and industry to develop new enterprises which is now provided by the grant of exclusive rights in inventions for a limited time.

Digitized by Google

APPLIES TO WAR AND PEACE

The Administrator is given special powers in (*a*) war, and (*b*) peace:

(*a*) During war to requisition the use of scientific or technical facilities, licenses, etc., and to determine just compensation for the same, subject to judicial review, with the right to sublicense, requisitioned patent licenses. He is the investigator of the efficiency of war production or supply, recommends improvements necessary and desirable, and becomes the exclusive representative of private and public applicants for allocation and priority ratings of critical material and equipment in scientific and technical research and development (sec. 5 (a), (1), (2), (b); sec. 6 (a), (1), (2), (3), (b), (c)).

For the Administrator's benefit the Selective Service Act is amended so that when on his application the "Chairman of the War Manpower Commission" certifies that scientific or technical persons are "critical" to the war effort, the Administrator becomes the exclusive authority for the occupational deferment of such persons and may direct their training (sec. 5 (a), (1), (2)). This personnel is said to number 1,700,000.

(*b*) All the other described powers of the Administrator may be exercised in time of peace to the ends described. He may make any investment necessary to the effectuation of the purposes of the act or the performance of his functions (sec. 4 (j); sec. 9 (b)), and to this end may require the production of books, papers, and other documents deemed relevant or material. This power may be exercised through any official designated by him. The courts are to enforce such powers under the threat of contempt. The refusal to supply such information or the violation of any regulations which the Commission has the power to make is punishable by fine and imprisonment (sec. 10).

UNPRECEDENTED AUTHORITY

It must be clear from the above provisions of the bill that it would concentrate in the hands of a single Government official unprecedented authority over all the properties and personnel devoted to scientific and technical research, planning, and training, not only in Government establishmets but among individuals, firms, corporations, and other forms of private employment and operation (sec. 8).

(*a*) It would compel the reorganization within the War and Navy Departments of committees and personnel engaged under the direction of or in cooperation with the military departments of the Government and make them in many respects subordinate to the Administrator. Such departments are mentioned in the bill only to advise the Administrator with respect to the necessity of maintaining secret in formation (sec. 6 (b), (c)).

(*b*) It withdraws from the Alien Property Custodian the powers which he has and presently exercises over patents and inventions (sec. 7 (a), (2), (b), (c), (e), (f)).

(*c*) The measure ignores the existing cooperation of the scientific and technical organizations of the United States now freely at the service of the Government and cooperating with the War and Navy Departments.

Schools, colleges, and universities engaged in pure research are brought under the control of the Administrator in training and direction to the extent he declares their personnel to be engaged in scientific and technical study, extending similar control to all private efforts of the same character whether individual or corporate (sec. 2 (b); sec. 4 (i), (m); sec. 7 (b), (c); sec. 8 (a)).

The effect of the measure is to authorize the complete socialization of all forms of property, plans, methods, technical information, and "know how" of all industries and all personnel devoted to scientific and technical effort. It would hopelessly confuse the relation of all various departments of the Government devoted to the prosecution of the war by reorganization of their relations to one another and to the proposed Administrator. Finally it wuld create the most despotic authority given to a single officer, and by vague and indefinite phrases it would enormously expand the enormous power conveyed.

EXHIBIT No. 127

THE SCIENCE MOBILIZATION BILL

By Senator Harley M. Kilgore

[From Science, August 13, 1943]

Science is to be commended most highly for devoting some of its columns to the free discussion of the science mobilization bill, S. 702. This legislation is of great importance to all scientific and technical people, and, finally, to all people of the Nation. Full discussion will ultimately bring out the real issues related to this bill.

More than a thousand letters have come to me about S. 702. From these letters I find that the men of science favor the bill. The vested interests, and those who are influenced or controlled by the vested interests, are against it, and they are most unscientific in their attacks upon it.

In reading the series of letters that has appeared in Science, I am impressed with the fact that most of these letters are concerned with peripheral, irrelevant, or misleading material. To illustrate, let me cite a part of the communication from Dr. Gustav Egloff, of the Universal Oil Products Co., in the issue for June 18. To support his contention against Prof. L. C. Dunn that "95 percent of our scientific and technical manpower and facilities are now highly organized and coordinated to the single end of advancing the war effort," Dr. Egloff quotes percentages from William L. Laurence's article in the New York Times of January 3, 1943, but he carefully refrains from quoting the preceding sentence giving actual figures. This is the unquoted sentence: "A survey now being carried out by our research personnel reveals that between 80,000 and 100,000 scientists are working, with about 80,000 in industrial and 20,000 in university laboratories."

In the same letter, Dr. Egloff lists 231,571 scientific and technical personnel, registered with the National Roster of Scientific and Specialized Personnel. Dr. Leonard Carmichael, director of the roster, testifying before the science mobilization committee last October, said that the number of scientists and technical men might be tripled with complete coverage, indicating that only about one-third of the available people were then listed on the roster. Multiplying Dr. Egloff's figure by three, the total would be in the neighborhood of 695,000. If, then, Dr. Egloff's 95 percent of 100,000 people, or 95,000 are at war work, the total so engaged is only about 13½ percent. This calculation is, of course, as ludicrous on the one side as Dr. Egloff's on the other. I give it only to show how figures can be used to mislead. Scientific and technical people who actually do the work know from their own experience and that of their associates the extent to which their talents are being used to prosecute the war.

Dr. Egloff of the Universal Oil Products Co., also used other interesting techniques in his fight against this legislation. I quote him:

"It is not too much to say that their passage (the two mobilization bills) might well be worth 100 divisions to our enemies".—The Chemist (April 1943, p. 229); the Journal of Commerce (April 12, 1943); the Chicago Tribune (March 14, 1943); the Washington Times-Herald (March 14, 1943).

"Their passage would be worth 100 divisions to the enemy".—the Chemist (April 1943, p. 252).

"The bill would be worth 100 divisions of trained motorized troops to Adolf Hitler."—Chicago Tribune (June 17, 1943).

Adolf Hitler wrote in Mein Kampf:

"* * * in the big lie there is always a certain force of credibility."

And:

"* * * only constant repetition will finally succeed in imprinting an idea on the memory of the crowd."

So here we have Dr. Egloff, of the Universal Oil Products Co., using two of Hitler's techniques in his effort to defeat this bill. Also, it is significant to note that the Chicago Tribune and Washington Times-Herald gave strong play to his words.

I am deeply concerned that American men of science participate in a full discussion of this legislation. They alone can provide the advice and counsel to make the bill adequate to the national need.

The bill is based on five primary needs:

Digitized by Google

1. The need for a central independent agency of Government devoted exclusively to the progress and expansion of science and technology, first to win the war and later to contribute to the peace. Science and technology need to be considered as a national resource, serving the interests of the Nation as a whole and not those of select groups. Indeed, it is the only remaining sector of our public domain. This agency should be an independent arm of Government, eventually on the same footing as the established departments.

2. The need for integration of existing Government research and development facilities. There are about 20 major and 40 minor bureaus in the Government devoted to research and development; their operation cost more than $557,000,000 last year. The excellent work of these groups should be so integrated as to widen the usefulness of their work and to provide a greater service to the public.

3. The need for active governmental support of fundamental research. The Government should give widespread support to basic research, by grants to existing nongovernmental as well as governmental groups. This would apply particularly to universities and colleges, where fundamental research should flourish. Insufficient budgets have caused our educational institutions to depend increasingly on industrial grants and fellowships. This, to an alarming degree, has reduced much of university research to the status of handmaiden for corporate or industrial research, and has resulted in corporate control of many of our schools.

4. The need for a uniform and effective policy to achieve the fullest utilization of scientific and technical manpower in wartime.

5. The need to promote the use of Government patents in the interest of the public. These patents are to be clearly distinguished from privately owned patents. They are of three types: Those derived from Government research and development and assigned to a Federal department or bureau; those held by the Alien Property Custodian; those derived from nongovernmental research financed by Federal funds.

The use of these patents needs to be promoted, and they should be administered for the public good.

I have long realized the basic importance to the welfare of the country of a free science and an expanding technology. I have long advocated a far-reaching program of governmental research. The experience of Federal agricultural research provides ample precedent for such a step. I have also observed that all advances in the public interest are fought bitterly by selfish interests. Examples have been the establishment of our public-school system, public ownership of municipal water supplies, enforcement of sanitation of the milk supply, range and forest conservation, public ownership of power, and so on.

Scientific and technical men hold in their heads and hands the collective knowledge of the ages. Whose knowledge is it? The group, more than any other, can help achieve these purposes: To free technology for its maximum use in this technological war, and a free technology for the greater advancement of the American people.

SCIENTIFIC MOBILIZATION

FRIDAY, JUNE 4, 1943

UNITED STATES SENATE,
SUBCOMMITTEE ON WAR MOBILIZATION,
OF THE COMMITTEE ON MILITARY AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to call, at 10:40 a. m., in room 104-B, Senate Office Building, Senator James E. Murray (acting chairman) presiding.

Present: Henry H. Collins, Jr., executive secretary of the committee.

Also present: Walton Hamilton, Antitrust Division, Department of Justice.

Senator MURRAY. The purpose of the hearing this morning is to have testimony from Senator Bone on the subject of patents. You may proceed, Senator Bone.

STATEMENT OF SENATOR HOMER T. BONE

Senator BONE. Mr. Chairman, the statement that I propose to make is somewhat general in its terms and is intended to be such a general statement rather than a discussion of specific matters.

I make this statement in a preliminary way because the field of patents is probably as complicated as any field of human endeavor and, therefore, I will not attempt to discuss all the various aspects of patents which would consume all the time of the committee for the next 6 months.

The safety of the Nation and the welfare of its people are dependent upon the progress of science and the useful arts. The Congress was charged by the Constitution with the steady development and the full and immediate use of discoveries and inventions. The letter-patent currently issued is the device chosen by Congress to promote this public end. It is, therefore, the duty of Congress to observe from time to time the operation of "the patent system," and by appropriate legislation see to it that the grant is held true to the end which the Constitution intended it to serve. As the President of the United States wrote on April 13, 1942:

> Patents are the keys to our technology, technology is the key to production, production is the key to victory.

For many years the people of the United States suffered scarcity in the midst of plenty. In the shadow of abundant natural resources we have seen hundreds of idle plants and millions of unemployed citizens. As a result a nation, rich in the materials of useful goods,

Digitized by Google

has stood in critical danger because of shortages of things essential to human welfare.

The war-production program of the last 2 years, spurred by the will of the American people and the necessities of defense, has suggested possibilities inherent in our economy.

But the fact has fallen far short of the promise. Many known processes for the more abundant production of commodities and services have in the past been unavailable to persons who would have been glad to put them into production. Many advances in the industrial arts have been held back or have known a very limited use. In many domains we lack—where we might have had—devices, discoveries, and inventions and the plant facilities for their conversion into a more abundant production of commodities and services for our people.

The strength of our fighting front is the strength of the industry behind the lines. We cannot fortify our military outposts abroad without fortifying our economic institutions back of the line.

There must be strength to withstand the onslaughts which the future will inevitably bring.

TECHNOLOGY AND THE WAR

The patent system, like every other instrument of the national economy, needs to be geared to the war effort.

Access to the necessary technology must be assured to all who directly or indirectly turn out the material of war. At present some concerns still hesitate to solicit contracts because of a fear that in manufacture they may "infringe" a patent. As an all-out is called for, the fear of infringement suits still hangs heavy over the whole industrial system.

Alien or enemy ownership in technology has laid its paralyzing hand upon nerve centers in our economy. In particular German concerns acquired a host of domestic patent rights; they refused to allow licenses to our domestic concerns, or imposed terms which seriously shackled production. Hearings before my committee have demonstrated the paralyzing effects of such arrangements between American and German firms in respect to tungsten carbide, ammunition, dyestuffs, synthetic rubber, and other vital war materials.

And it is not easy to get to the heart of the mischief. Patents, which represent rights in technology, are transferable. There are assignments, licenses, leases, contracts of all sorts and kinds. Corporations have affiliates and subsidiaries in other countries.

For one to hold rights for someone else in "beneficial ownership" is a common device of the law. An I. G. Farben lawyer can easily concoct a legal rigmarole by which the nominal owner is one person and the real owner another man. A number of transfers may utterly confuse the picture. Axis concerns were good at the trick of resting nominal ownership in the hands of a corporation of a neutral country and still being able to pull the invisible strings. Even American concerns have been used to make alien ownership. The whole business presents a host of legal mazes which it would take the courts years to unravel.

The point is that we cannot, especially in war, deal with the owners of rights in technology. We must deal with the rights themselves. It is access to the industrial arts which the war effort requires.

Digitized by Google

THE ALIEN PATENT PROBLEM

Our Government allows aliens to obtain patents upon the same terms as American citizens. In such grants men whose allegiance is to a foreign power acquire rights in, and control over, strategic industrial processes. It is essential to cut through all legal fictions to the industrial realities beneath. No procedures which move on the nominal or legalistic level can prove effective.

1. The focus is alien control of technology, not alien ownership of patent rights. In anticipation of our entrance into the war the Third Reich has taken precautions to see to it that its subjects, personal and corporate, divest themselves of formal ownership. Its control over the useful arts remains, and it is this strangle hold which needs to be broken. It must be broken.

2. To that end complete information is necessary. Not only must all patents and all assignments—as now—be made matters of public record, the legal obligation to full disclosure of alien patents must extend to all licenses, all agreements in escrow, all relations of corporation and subsidiary, all contracts of whatever kind used to secure or to give effect to a patent right. A statute should make null and void any instrument of that character not made a public record.

3. The obligation to record should extend as far as necessary to achieve the general objective of full knowledge of alien ownership and control. Often rights in American patents are given as consideration for rights under foreign patents. Where cross licenses are exchanged, and one of the two parties concerned is—or in the past has been—an alien, the whole transaction needs to be put on open file. Such are the ramifications in the use of a patent, and such are the interlockings between patents, that it is hard to see how the command to register can stop short of all patents, and all instruments of their use, in all defense industries. If endless bother and crippling delay are to be avoided, full publicity must be required of all agreements which give effect to all patents.

4. Alien, rather than enemy, is here the key word. A large number of German patents have been transferred to persons whose political allegiance is Holland. A far larger number are at present nominally the property of individuals who are citizens of, or corporations chartered by, Sweden or Switzerland.

5. The office of the Alien Property Custodian is at best not too neatly fitted to the task of having and holding alien patents. At law a patent is not an ordinary sort of property, and the law of trusts is not appropriate to its effective use. The task of the Custodian is to seize the alien property, to secure and conserve it, to bring it along as an investment, to make it yield as large a return as possible. He must, of course, take it out of enemy ownership, but that done his task is by office and tradition essentially that of managing an estate, for he is a public guardian of a private interest.

6. The patent departs radically from this norm. It is, as the Supreme Court has recently said, a private claim in a public domain, an instrument which gives effect to a public policy. As an instrument by which access to technology is given or denied, it is affected with an interest to the whole economy. In time of war this public interest becomes the dominant mark of the grant. A privilege from the Government must not be used to restrict or defeat its war effort.

Digitized by Google

It must be used to secure that all-out in respect to output upon which military success depends.

7. It seems evident, therefore, that the control of alien patents, in the most comprehensive reach, must be lodged in somebody who is charged to make of it a positive instrument for winning the war. A body such as the technological commission proposed by Senator Kilgore might meet this demand.

DUTIES AND RESPONSIBILITIES

An exclusive right in a technical process not only accords a right but also imposes a responsibility. It enables its owner to collect a toll upon the use of his invention. As a charge for a contribution to science or a useful art the royalty is quite legitimate. But an owner who is unmindful of his responsibility may levy unfair tribute upon the pocketbook of every man, woman, and child in the Nation. He has it within his power to wield a control which may reach out to affect the standard of living of the people. This control can, if responsibility be forgotten, be employed to restrict opportunity, impose a brake upon production, clog the channels of employment, and help sterilize the war program.

The grant of a patent imposes upon its recipient duties as well as privileges. Experience and the testimony before the Senate Patent Committee has shown that we can no longer afford to allow every patentee to be the sole keeper of his own conscience. As he becomes sensitive to personal and corporate advantage, sometimes he becomes obtuse to the obligations of his fiduciary office.

It is necessary to establish safeguards to protect the national interest against the abuse of the patent privilege by a positive definition of the duties which attend the patent grant. The Congress, of course, cannot infuse social responsibility into the hearts of business executives. What it can do is to make obligations so specific that neither executive nor courts can mistake them.

It can blaze the path so clearly that corporate officials may conduct their affiairs in ways which carry no jeopardy to the national interest. As citizens of the American republic officers of corporations occupy positions of public trust. Owners of patents have a fiduciary responsibility to their fellow citizens in a free democratic society.

It was an obligation to stockholders, compromised more or less by personal interest, which led our corporate executive to deal with Axis concerns controlled by the Nazi state. It was an indifference to public office and duty which led them to deliver control over vital American resources into the hands of the Farben crowd.

In a democracy patriotism must come first; if need be, new laws must be written in order that it may come easily, naturally, as a matter of course.

PATRIOTISM AND GOOD BUSINESS

If the Nation is to endure, there can be no separation between patriotism and good business. Executives, with an eye to profits, must so channel their acquisitive activities that the result is to enhance the strength of the Nation and serve the general welfare. Where public

Digitized by Google

good and private gain are in conflict, it is the urge toward profits which must make way. This is the law of self-preservation for a democracy. And there is no other.

A patriotism so dulled that it will respond only to a cash incentive has lost its character. If citizens of our economy have become so materialistic that without monopoly profits they cannot be patriots, the cause of popular government has fallen on evil days. So long as our Government is representative government it is everybody's business.

The duty to protect and defend the Constitution, as it has become manifest in a living nation, is imposed upon all. The spirit of a free people cannot endure, if a privileged group among us is exempt from its call. The law by which we are compelled, and the spirit of a free democracy by which we are guided, must be brought into accord.

The great story of knowledge called technology is a legacy from the past. Enriched by current inquiry, it is a bequest to the future. Upon the man or corporation who benefits from the Government's grant is imposed the obligation to conserve, employ, and develop the useful arts which he passes on. A clear abuse of the fiduciary trust should lead to the cancelation of the instrument and the restoration of the invention to the public domain.

That, Mr. Chairman, is the formal statement that I desire to present to your committee in connection with your inquiry into the matter before you.

Senator MURRAY. Thank you, Senator Bone, for your very able statement.

I assume that in your committee studies, you have uncovered many examples of the abuse of these patent rights.

Senator BONE. Last year we carried on extensive inquiries covering cartel arrangements involving some of our large American business enterprises and the German Farben crowd.

The alliance revealed was a very close one. The extent and degree of control exercised by the Farben organization, which was an instrumentality of the Hitler government, presented an astounding picture.

Senator MURRAY. Was it deliberately planned, part of a deliberate scheme on their part actually to control this country and its production program?

Senator BONE. Upon the part of the Farben organization which upon the accession of Hitler, became an instrumentality of the German Government, I think it was both business and political.

Farben was Hitler and Hitler was Farben. The German Government bent this instrumentality to its own ends and purposes. Every Farben organization set up anywhere in the world was a listening post for the Hitler Nazi machine and, therefore, it performed a political function in the field of international policy and polity.

I think the record proves that beyond any doubt. We did not finish all of the field of cartel arrangements. There were two that were not touched upon, both of which were vitally important and in my judgment should have been inquired into and the record disclosed for the public.

The American businessman went into that arrangement because, through patent organizations, an almost airtight control over certain economic processes could be achieved. For instance, in the metallurgi-

Digitized by Google

cal field, in the chemical field, and in the dye field—but in the metallurgical and chemical fields primarily—an almost complete and airtight control of the business of the entire world could be achieved.

The control rested naturally and necessarily upon patents.

The purpose of the Farben crowd, made evident by many of these contracts, was to give big American concerns most if not all of the American market in exchange for which Farben had the rest of the world, and it was simply a device which enthroned a modern type of feudalism. It was feudalism in a new dress adapted to modern business practice.

They simply divided up the whole world for exploitation.

Senator MURRAY. And the American concerns entered into that scheme wholeheartedly with the full knowledge of what they were doing?

Senator BONE. They either knew or you would have to charge them with a form of stupidity the like of which you and I never in our lifetime witnessed.

The contracts reveal the story if you want to read the nine volumes my committee turned out. You will find hundreds and hundreds of exhibits consisting of exchange of correspondence, interoffice memorandums, contracts that went into the minutest detail of their business arrangements.

Mr. COLLINS. Senator Bone, I believe you wanted to insert some of that material in our record?

Senator BONE. Here are excerpts from some of the more interesting aspects of the cartel hearings before my committee. The excerpts concern 13 of the most important products of modern industry.

The control of these products arose out of patent controls, and the effective control all over the world of all the world markets was made possible through these cartel set-ups.

If any man attempted to invade that monopoly field by some invention of his own they would threaten him with an infringement suit and generally frighten him into submission because they were powerful enough to wreck him. A small man could not stand up in the face of innumerable infringement suits. It would break him.

Senator MURRAY. A patent is not of value to an individual who is not in the combination or hasn't the immense wealth to back him up?

Senator BONE. I will leave these exhibits with you and ask that they be printed in the record.

Senator MURRAY. They will be included in the record.

(The material referred to was marked "Exhibits 128–141" and appears on p. 328 and following.)

Senator BONE. I will give you an illustration. For instance, cemented tungsten carbide was one of the outstanding manifestations of how effective monopoly control can be. It is almost the hardest material known. It is made up in small bits which are put onto the edge of a cutting tool, on lathes and the like. This cemented tungsten carbide will cut through steel as though you were cutting a chunk of putty with a knife. The Krupp crowd, by cartel arrangement with one big American concern, established a price in America which made its wide use, in my judgment, absolutely prohibitive. Apparently no great effort was made to stimulate the use of it here at the very moment when Hitler was building his vast panzerized and mechanized

Digitized by Google

machine to overwhelm the world. In my judgment, without cemented tungsten carbide the German military machine could not have been built in the time that it was built and in the efficient fashion that it was built. By virtue of this control, only about three small American concerns were given licenses of somewhat restricted character by the American cartel member. One man holding that license, a small American concern, testified before the Patents Committee of the Senate. In this connection I have to use round figures because I have forgotten the precise amount, but he testified that he had an order from a Government agency for some of the cemented tungsten carbide cutting edges. Under his license agreement he was required to charge in excess of $8,000 for these pieces of cemented tungsten carbide, whereas he, with his equipment, could have made them and sold them to this Government agency for around $3,000 and made a good profit.

Senator MURRAY. It was not merely a question of profit at all?

Senator BONE. It was a question of absolute control by a world cartel combine of which the Krupp-Farben-Hitler crowd was a part, which compelled this little fellow to charge his Government $8,000 when he could have sold it for $3,000. In other words, the taxpayers in this country got nicked in that one transaction about $5,000.

That illustrates the point I tried to make plain in my statement that these men were not above putting these rather crass considerations above the war we are facing. That testimony, I believe, is the testimony of Mr. Firth who was a licensee from the American wing of the Krupp cartel monopoly.

About the time Mr. Firth testified, the American concern that was in this friendly position with the Hitler crowd, through the Krupp tie-up, used enormous numbers of full-page ads in newspapers all over the country to explain how sweet and gentle Germany had been in dealing with us. We will contemplate that picture a little differently when we count the casualties in this present conflict with Germany.

The time has come to end that kind of business and not permit any American citizen or firm to enter into one of those feudalistic combines to control the business of the entire earth. Until such relationships are made apparent to the people of this country by a complete and full revelation achieved by filing all the documents and contracts in a public place in this country, the people of this country will never know just what is being done.

This much I think, Mr. Chairman, may be said. It is merely a realistic contemplation of this problem. These Americans, by these contracts, bound this country and the people of this country to an economic pattern more persuasive and effective in shaping the lives and destiny of the people of this country than we accomplished by many treaties which were formally ratified by the United States Senate. The Senate has spent hours and days discussing treaties. They were formally ratified or rejected, these treaties, and yet the gentlemen in the big business world of America sat at their mahogany desks and made combinations among themselves and with Farben and Krupp and entered into what amounted to treaties among themselves that did more to shape the economic destiny of the people of the United States than any treaty that we were considering in the United States Senate.

Digitized by Google

They were making and unmaking the business pattern of the entire world. They were allotting markets and fixing prices on life-saving materials, life-preserving drugs. They were saying how much might be made and how much might be sold of many vital things, and how much the people should pay for them.

This cemented tungsten carbide example requires nothing else to demonstrate the grim necessity of getting out from under that sort of private Government.

I want to terminate this statement by saying that in my own judgment the Farben crowd, being very smart gentlemen and having emerged from the last World War stronger than ever, will see to rehabilitating their great business machine by organizing new corporations in other countries, and unless we are very careful, more forthright and successful and more courageous than we have been in the past, we will end this war with the Farben crowd still dominating vital markets and it would be a supreme tragedy. That part of the war would be lost, Mr. Chairman.

Senator MURRAY. Senator Bone, so far as the immediate situation is concerned, I think this bill which has been introduced by Senator Kilgore providing for the mobilization of our scientific and technical resources, the establishment of an Office of Scientific and Technical Mobilization, would be helpful.

Senator BONE. Mr. Chairman, I have not had an opportunity to read the new bill. I understand that it is somewhat different from the one which I read last session. Since I read the first bill I have had a great many office problems of my own. With such a mass of work in my office, I have had no chance to go through the revised bill.

Senator MURRAY. You think it is a matter that should be given careful study?

Senator BONE. I think the proposals of this bill should be given most careful study. A bill like this probably would not have been introduced had there not been frightful abuses which challenged the author of this bill. No one so far has come forward and said that the records that were introduced before the Senate Patents Committee were false. They have merely said they presented a wrong picture but no one so far has said that the contracts were not set out at full length and presented a cold realistic picture of the relationships of these men of the cartel world.

Just a few days ago, and this is very challenging, the stockholders of Standard Oil of New Jersey were asked to agree not again to enter into contracts with the Farben crowd after the war. I think it was the president of Standard who said they were affronted by the suggestion by minority stockholders that they should not enter into these harmonious business relations with Farben after the war. I cannot understand why they would be affronted by the suggestion that they break loose from a country that is butchering our sons today, and that through these very cartel combinations was able to take advantage of and acquire the technical knowledge that we possessed in this country; because, Mr. Chairman, through those means we helped to arm our enemies. We gave them vital information. We sold them magnificent airplane engines. We sold them steel. We sold them technical knowledge, and it is coming back to us in blood and sweat and tears, but we are assured that this kind of thing is "good business."

Digitized by Google

The result is we are facing a very great economic crisis in this country due to the impact of war upon our economy. We face the frightful burden of deaths. The birds are coming home to roost. You cannot safely arm a country which for years has been declared a potential enemy of this country. You cannot pour out our resources to help arm an enemy without some day having to sit in sackcloth and ashes as the result of such blind folly. That is exactly what we face today. I think any realistic citizen knows that.

Mr. COLLINS. Senator Bone, you introduced a bill last year as the result of your hearings, did you not?

Senator BONE. Yes. Certain bills were introduced before the hearings. Those bills dealt with the patent system as it is operated in this country. There were three Senators on each bill. We undertook to get out of the way a complete picture of the cartel system before we went into a discussion before the committee of the technical provisions of those bills, and because the committee met and decided they did not want to have any more of the picture of cartels unfolded, the hearing came to an end before we got into a discussion of the technical aspects of those bills. There were two of them. There was also a third bill introduced by Senator Lucas, who was a member of the committee, and I am at the moment considering the reintroduction of that bill with some modifications. It is not precisely a bill dealing with the patent system, as such, but rather with remedial measures that have to do with certain aspects of the antitrust law which would be invoked in case of existence of a cartel system which created a monopoly.

Mr. COLLINS. Would it be possible for you to file with this subcommittee copies of those bills which were introduced last year?

Senator BONE. Yes; they will be available from the clerk of my committee. I am sorry I cannot give you the numbers of them. It might be that you might introduce into your record all three of them or the one that Senator Lucas introduced.

Mr. COLLINS. I think Senator Kilgore's intention, as he has often spoken of it, was to incorporate in this bill certain patents features that would be applicable to the war situation. My understanding is that your bills are related to a more comprehensive study and revision of the patents laws, both in war and in peace.

Senator BONE. That is right. One of them in which Senator O'Mahoney was primarily interested was largely the outgrowth of the T. N. E. C. hearing, during which Dr. Walton Hamilton testified. I think Dr. Hamilton is familiar with that bill that Senator O'Mahoney introduced, and Senator La Follette and I joined with him in introducing it.

Mr. COLLINS. Could you have prepared a brief analysis of the difference between the field covered by your bills and the field covered by the patents features in this Kilgore bill?

Senator BONE. I would be happy to do that if I had anybody on my staff who could take time to do it right now, but we are so immersed in work that it is very difficult to take somebody off my work that is piling up to do this kind of work and make break-downs of the differences between the two bills. During the hearings of the patents committee I had some extra clerks.

Mr. COLLINS. I do not know whether Dr. Hamilton would be able to give any help on that or not.

Digitized by Google

Senator BONE. I would be glad to supply any information that I can on the bills themselves, but I do not believe that I could find time for a member of my staff to do it. You could print the bills side by side and point out the differences.

Mr. COLLINS. Dr. Hamilton, would you be able to prepare a brief on those differences?

Dr. HAMILTON. I think I probably can find someone to do it. I would not be able to do it this week or next week myself.

Mr. COLLINS. That would be very helpful for the record.

(The material referred to was marked "Exhibit No. 142" and appears on p. 700.)

Senator MURRAY. Senator Bone, do you believe that there is any intention on the part of these international combinations to continue to undertake to function after the war is over, as they did in the past?

Senator BONE. I think there is no doubt about it. This meeting of the stockholders of Standard Oil the other day, when they voted down deliberately a resolution to pledge themselves to abandon post-war relations with Farben, is an indication of some sort. As a lawyer, I would conclude they were hopeful of renewing their relations with Farben after the war.

In many of the pieces of correspondence, Mr. Chairman, in this patents hearing, were expressions indicating the fact that the threat of war seemed very real and that, in case of such an unpleasant interlude of war, they would have to suspend their pleasant relations, but after that unpleasant interlude was over they would hold hands again, and it could all be fixed up in accordance with their existing understandings. If the law in the meantime intervened to prevent a renewal of the contracts, they would then recognize the "spirit" of the previous contracts that bound them in any new contractual relationship. That, in substance, is about the effect of the documents exchanged between them. It was all very beautiful and very harmonious.

Senator MURRAY. It was very gruesome, I should say.

Senator BONE. I have my own western expression for it, but gruesome is a nice chaste word for it.

Senator MURRAY. Have you any information with reference to what is going on in Switzerland at the present time in connection with this problem?

Senator BONE. I only know that there has been a good deal of manipulation of legal identities, and probably Switzerland, because of its neutral position and its accessibility as a field of operations for lawyers, will be found harboring some corporate identities that will disguise Farben activities. I think when the war ends you will find that will be probably true of the Scandinavian countries also. Their corporate laws would be utilized to shelter some corporate creature that will be Farben in disguise.

Senator MURRAY. Carried to its fullest extent, these plans would give these international concerns practically economic control of the world, would they not?

Senator BONE. Mr. Chairman, I want to say that the control achieved through the cartel system is as near feudalism as anything could be devised in these modern times of ours. It was feudalism in a new dress. The control was airtight. Cartel members want stability and monopoly. The thing is essentially a negation of "capitalism." It

Digitized by Google

will spell the end of classic and orthodox capitalism if it continues because, as I see capitalism, it is a system of free enterprise in which there is a free play of competitive forces. These gentlemen of the cartel world do not want "capitalism." They want "monopoly" and it is business feudalism. They want one group to control through a vertical and horizontal trust, and that, sir, is not capitalism. This device is a much more destructive force, as far as true capitalism is concerned, than even what the Communists have brought forth. The world is naturally suspicious of what Communists say, but these gentlemen in the cartel feudal set-up are outwardly for capitalism but this cartel system postulates the death of capitalism in its orthodox form.

I do not think capitalism, as we understand it, can survive in the face of a cartel system in the major lines of business. Capitalism could only endure then among the little fellows who compete vigorously with one another.

Senator MURRAY. Even among the little fellows, isn't it true that the same kind of effort to control and dominate prevails within the individual countries and independent or free competition is passing out entirely?

Senator BONE. That is right. Free competition is passing away and we are, oddly enough, at the moment, when we hear much defense of the capitalist system, witnessing the commencement of its extinguishment. That black-out is coming about because stanch defenders of capitalism further the cause of the very creature they are bringing into being, the Frankenstein of monopoly which in itself invites the utter destruction of the capitalistic system. That is a fairly accurate portrayal of what is happening.

Senator MURRAY. Don't you think that some of these captains of industry in the United States are beginning to realize the danger that is developing and are now beginning to feel that they should devote some effort to preserving free enterprise in this country? They seem to profess that, at least, and I have read in the newspapers speeches by some of the representatives of the biggest industries in the United States making pleas for the preservation of small business. Do you think those are sincere efforts on their part or sincere expressions?

Senator BONE. I do not know how sincere some of them might be in statements of that kind. I would not sit in judgment on their honesty of expressions, but I know that when you enthrone monopoly you decree the death of the little fellow in business. He cannot exist.

Senator MURRAY. And when any concern ever achieves monopoly in any field, they are very loath to surrender it.

Senator BONE. That is right. The moment monopoly is achieved, they want to hang on.

Senator MURRAY. Regardless of its effect upon the people as a whole?

Senator BONE. That is right. Mr. Thurman Arnold put it accurately when he said that these big fellows want stability. They want regularity of earnings. It is a perfectly understandable attitude of mind, within itself. It does not indicate villainy; but when they achieve the kind of stability they want, the absolute control which alone will give that stability is to be found in monopoly. Every impulse to achieve a monopoly, and that is what the cartel gave and that is why it was so delightful to the big boys in this country. They loved it. They

Digitized by Google

wanted it because the little fellow had no more chance than a snowball in the nether regions. Competition was dead.

There can be no such thing as a free enterprise system left in America if the philosophy of that cartel crowd becomes enthroned and predominant. Free enterprise will die in America except in very limited fields. There will be a very few left on the ragged fringe and they won't hurt the big fellows, and when I say that, I mean the monopolists. That is the grim thing that faces us in America.

We should quit fooling ourselves with slogans.

Senator MURRAY. What do you think of the possibilities of the Antitrust Division of the Department of Justice being strengthened and enabled to carry on a struggle to overcome this situation? Do you think that they can succeed in controlling a monopoly.

Senator BONE. The Antitrust Division, over the years, as every lawyer in Congress knows, has been starved for funds.

It is only in recent years that it has had sufficient funds to operate on. The antitrust law has been a joke. It has been so much of a joke it has been the butt and target of ridicule on the stage in America and of businessmen in general, and yet it is the only method by which you can breathe the breath of life into the antitrust law and protect the little fellow who is a part of a free enterprise system. It seems peculiar to be defending the little fellow's rights and yet go right along with combinations that are strangling the little fellow.

It is a ghastly joke—on the small businessman and the people.

We persist in a perversion of logic. We assert on the one hand that we want free enterprise and, on the other hand, we allow these monopolies, representing economic feudalism, to stifle free enterprise. We are going to have to make grim decisions in America if we want to keep a system of free enterprise. Shall we retain this greater freedom or surrender that to monopolists?

The Axis countries claim they have more efficiency in government by having dictatorship, but free people are not willing to pay the price for that type of efficiency. Axis philosophy in business is equally deadly to the small businessman.

The dictators can move armies around in a way that we cannot, but Americans would not stand for that kind of business. Free men do not want to have that sort of machinery dominating their lives.

Senator MURRAY. This is the most serious question that is confronting the people of the United States today, is it not?

Senator BONE. I think that is right.

Senator MURRAY. And it seems to me that we should begin carefully to study and determine what the future of this country is going to be because it is very rapidly evolving into a totalitarian system.

They complain every day and you read in the papers attacks on bureaucracy, which is the result of these combinations. You cannot have these powerful combinations without bureaus to undertake to control them to some degree, at least.

Senator BONE. There can very easily grow up two forms of totalitarianism: one the Axis political type, governmental type; and the other an autocratic bureaucratic private monopoly. The cartel system is a fine example.

Oddly enough, we level all our diatribes and turn all our guns on political autocracy and all the time the other type is entrenching itself firmly in our own Nation. It is a deadly threat.

Digitized by Google

If one is curious about that, he can read the nine volumes that our committee has on file on the cartels; how they completely dominate the world in some of the most vital aspects of our life and how these big fellows were completely in control. It is a story of autocracy, dictatorship, and feudalism, written by the authors of this deadly enemy of a free-business system.

Senator MURRAY. The committee is very grateful to you for coming here this morning and giving us the benefits of your studies on this very important subject. We want to thank you for your contribution.

Senator BONE. I am very happy to have been before you, Mr. Chairman.

(Whereupon, at 11:15 a. m., the committee adjourned.)

EXHIBIT No. 128

CEMENTED TUNGSTEN CARBIDE

Statement by John Henry Lewin

INTRODUCTION

I appear here in obedience to subpenas duces tecum served upon me and upon my superior, Mr. Thurman Arnold, assistant attorney general. Pursuant to these subpenas, I have produced here this morning exhibits relating to an important machine-tool metal, known as cemented tungsten carbide, which are mostly copies of communications and other documents furnished principally from the files of the General Electric Co., its subsidiary, International General Electric Co., another of its wholly owned subsidiaries, Carboloy Co., Inc., and, to a lesser extent, from the files of some of the sublicensees of Carboloy Co., Inc., and also from the files of Thomas Prosser & Son and Union Wire Die Corporation.

These documents, and the facts they disclose, were first revealed to the Government in 1940, when they were voluntarily furnished in aid of a routine grand-jury investigation in the southern district of New York of possible violations of the Sherman Antitrust Act. As a result of that investigation indictments were returned on August 30, 1940, and October 21, 1941, against the following corporations and individuals: General Electric Co.; International General Electric Co., Inc.; Carboloy Co., Inc.; Fried. Krupp Aktiengesellschaft; Walter M. Stearns, manager of special contracts of General Electric; Zay Jeffries, chairman of the board of Carboloy; Walter G. Robins, president of Carboloy; charging them with monopolizing, attempting to monopolize, conspiring to monopolize, conspiring to restrain interstate and foreign commerce, all in violation of the Sherman Antitrust Act, and conspiring to restrain foreign commerce in violation of the Wilson Tariff Act. I introduce these documents as exhibits 1 and 2.

Except to answer such questions of the committee as I may be qualified to answer, I shall confine my testimony to an orderly recital of the facts which the documents appear to reveal—to a large extent quoting directly from the document themselves—to comments which may be necessary for purposes of explanation, and to the drawing of such inferences as anyone who has time to study the documents might also draw. I understand that the purpose of these hearings is not to punish for any violations of law or questionable practices or to cast odium upon any person, but rather to discover, from illustrations of what can be done practically under the present patent system, what correction in the system is necessary. I shall, therefore, endeavor to point out these facts as illustrations of practices which may be encountered under our present system. I should like my testimony to be taken, not as testimony of original facts peculiarly within my knowledge, or as expert testimony, but rather in the nature of a lawyer's explanatory opening statement of facts which documents in his possession tend to substantiate.

The documents which I have produced show that the commodity which was allegedly subject to monopolization and restraint by the use of United States patents is hard metal composition (principally cemented tungsten carbide) which is the best material yet discovered for making cutting edges of machine-cutting tools and wire-drawing dies, and hence a product invaluable to the Nation in its war preparations. Such hard metal composition is fabricated principally into (a) blanks for cutting tools, such as lathe tools, milling cutters, reamers, borers, drills, saws, and for other devices used with machine tools for the cutting and machining of metals in the automobile, aircraft, tank, shipbuilding, munitions, and other heavy-production industries; (*b*) nibs for dies used for drawing out wire, tubing, metal rods, etc.; (*c*) extrusion dies used for forming metal articles, such as screws, bolts, etc., and cartridge-shell casings for rifles, machine guns, and artillery; (*d*) wear resistent parts of factory equipment which are subject to extreme and abrasive wear; and (*e*) wearing surfaces of precision instruments, such as gages, calipers, and other measuring devices.

Digitized by Google

Such hard metal composition is made by cemeting or binding together, by means of a process called "sintering," extremely hard but brittle particles of tungsten carbide, tantalum carbide, or titanium carbide by a matrix of iron, cobalt, or nickel. The resulting product has the hardness of the carbide and the toughness and strength of the auxiliary binder.

The documents I have produced here tell the story of the use of patents, continuously throughout the 12-year period from 1928 to the latter part of 1940, which resulted in monopolizing the American market; limiting American production of such hard metal composition and tools containing the same; cutting off American imports and exports; dividing up world markets between American and German interests by cartel agreement; permitting since 1936 the Krupp Co. of Essen, Germany, to decide who should become American manufacturers; and the fixing and maintaining of unconscionable and prohibitive prices and resale prices (as high as $453 a pound) throughout the United States.

The complaint which initiated this grand-jury investigation was the outcome of an invitation for bids for 1,000 pieces of tungsten carbide which was issued by the Frankfort Arsenal of the United States Army in 1940. Mr. L. Gerald Firth, president of the Firth-Sterling Steel Co., one of the controlled licensees of the patent pool, after preparing his bid in accordance with the specifications of his license agreement with the Carboloy Co., was sufficiently exercised by the apparent difference between the figure he would like to have quoted to the arsenal and the much greater figure which he was required by his license to quote, that he prepared for submission to officials of the Government a complaint, showing the comparison. According to the price specifications issued by Carboloy he was required to submit a bid in the amount of $8,730. In the light of cost figures applicable in his own factory, his independent determination was that at a total of $3,375 the Firth-Sterling Steel Co. would have received an adequate and reasonable profit on this order. This complaint disclosing these facts were orally submitted to the Antitrust Division of the Department of Justice after Mr. Firth learned that an investigation by the Department was contemplated. I introduce, however, as exhibit No. 3, a copy of a complaint of Mr. Firth, dated January 25, 1940, addressed to the Federal Trade Commission. I quote from that letter as follows:

"Our licensor is the Carboloy Company, Inc., of Detroit, Michigan, a subsidiary of the General Electric Company.

"These cemented carbide tools and dies are a most essential requirement of munition and mass-production manufacture. Our present costs show that we should be able to sell at far lower than the present prices. Large quantities of this material are now being manufactured in Germany, England, and France, many times the total production of the United States. This situation is, in our opinion, brought about by the unreasonably high prices at which we are compelled to sell and by the very unfair scale of discounts which make it difficult and in some cases impossible for the small user to use this material. In many cases these prices are from two to three times what we consider a reasonable price to smaller users. We do not complain of the net prices brought about by the large quantity discounts to large users, but we do complain that we are not allowed to extend a relative discount based on true costs to the smaller user.

"We trust that some action can be taken soon as we have no wish to be a party to anything which might be construed as an unfair trade practice."

Upon the return of the first indictment on August 30, 1940, in which, as I have said, these practices were charged to be violations of the Sherman Act, the carrying on of many of the practices disclosed was interrupted. Nevertheless, the complicated patent licensing system disclosed continues in effect and is ready at hand to be utilized again. Furthermore, documentary evidence shows that as late as December 1939, after the outbreak of the present war, the American companies were making plans to extend their agreement with Krupp until after 1950, a date which would be long after the date on which the most important patents involved would have expired. I introduce as exhibit No. 4 a letter from Peirce, foreign representative of General Electric in Germany, to Jeffries, chairman of the board of Carboloy Co., dated December 11, 1939. I quote from this letter as follows:

"Our friends at the Osram company informed me yesterday that Krupp would be interested in capitalizing the royalties now being received from Carboloy. In other words, they would like to sell us exclusive rights under these patents until 1943 with nonexclusive rights under the same patents thereafter. In this connec-

Digitized by Google

tion, Dr. Louis has asked for an appointment with me in Zurich, where we shall both be next week. They are quite anxious that the Krupp name be kept out of any correspondence, particularly telegrams, that might reach improper hands, and therefore I shall refer to them in the future either as the European licensors under Carboloy contract or simply as Dr. Louis.

* * * * * * *

"P. S.—Since writing the above I have received your message through Mr. Minor, also talked to Dr. Louis and Mr. Schurmann.

"They will now make us a proposition based on extending the contract to 1952 and our making a lump-sum payment for all hard metals—no matter what patents we use. I may get this next week and shall telegraph it to you at once."

In November 1937 Herod, of International General Electric, wrote to Baldwin, vice president of International General Electric, that the American companies wanted Krupp and a German concern in which the American companies were interested "to get together on some basis and would assure (*a*) to Krupp exclusive control of the situation in their domestic market, and (*b*) to the General Electric and Carboloy companies exclusive control in their domestic markets for such time" (i. e., until 1950 or 1954). I introduce a copy of this letter as exhibit No. 5.

The pool of patents upon which this whole structure was erected finally embraced more than 50 United States patents, contributed to a patent pool by various competing interests directly or indirectly by cross-licensing. The patents pooled were placed under the control of the General Electric Co. But General Electric is obligated to return to Krupp at the termination of the agreement all of the patents contributed to the pool by Krupp. This obligation remains unimpaired at the present time.

Cemented tungsten carbide has been produced abundantly in Germany, where it has been extensively used by German industry. Furthermore, German industry has enjoyed the use of this material at comparatively low prices. German manufacturers have sold approximately 12 times more of the metal than American manufacturers have sold in the same period for almost the same financial return. An exhibit disclosing this fact will be introduced later. I quote from an article in the issue of Fortune magazine for January 1942 as to the importance of this product in building the German military machine:

"How was impoverished Germany able to build her awesome war machine in * * * six short years * * *?

"The answers have been many * * * All the popular explanations have overlooked the possibility that a few hundred tons of phenomenal steel-cutting material called tungsten carbide may have been a decisive factor in the building of the arsenal of Hitlerism. Harder than sapphire and very nearly as hard as diamond, tungsten carbide was invented in Germany around 1915 and was taken over by the Krupp interests in 1916. Monstrous Big Bertha of World War I was tooled with tungsten carbide, and the new substance gave German industry a decided advantage over the Allies (who had developed nothing comparable) in armament production.

"Part of the magic of tungsten carbide is its hardness. Part is the fact that it has a melting point about 2,800° centigrade. These two properties make it so far superior to high-speed (tungsten alloy) steel as a cutting edge for machine tools that there is hardly a basis for comparison. In many machining operations substitution of tungsten carbide for high-speed steel multiplies the rate of production at least 500 percent. And Germany retained unquestioned leadership in the use of tungsten carbide after the Armistice, even though Krupp licensed other producers throughout the world. Britain, France, and the U. S. were sluggish about retooling, and it is estimated that in 1938 Germany had twenty times as much tungsten carbide in use as in the U. S. This—according to many experts—is one of the great secrets of German rearmament. These experts also think that without tungsten carbide it would have taken the Reich twice as long to achieve half the results. Furthermore, fragments of shells picked up on various battlefields indicate that Germany is using tungsten carbide for projectile tips and even may have developed a superior lightweight armor plate consisting of thin layers of carbide and steel."

In contrast with the situation in Germany, the present drastic shortage of this essential material in this country is notorious. The need to produce it, to retool our manufacturing plants with it, and to instruct workmen in the use of such tools has constituted one of the principal bottlenecks in our present production program. I quote from exhibit No. 6, an affidavit of Robbins, president of

Digitized by Google

Carboloy Co., dated July 14, 1941, submitted to the District Court of the United States for the Southern District of New York:

"3. The Carboloy Co. is the largest manufacturer of cemented carbides in the United States. In the past it has manufactured about 60% of the total U. S. production and I estimate that it is now manufacturing a larger proportion. Since 1939 defense requirements for cemented carbide tools and dies have resulted in tremendous demand upon the company for increased production. Whereas in 1938 Carboloy Co. manufactured 3,176 kilograms of cemented carbide metal and powders during the entire year, the company is now manufacturing at the rate of 10,000 kilograms per month, an increase of 1,200%. Nevertheless the company's unfilled orders have increased, and defense demands for immediate delivery become more imperative. To eliminate shortages for defense purposes, Carboloy Co. is erecting an addition to its factory and, with its completion in December 1941, expects to be producing prepared powders and metal at the rate of 30,000 kilograms per month."

The activities which these documents reveal are considered by the Department of Justice directly responsible for the disadvantage at which this country finds itself in comparison with its enemies in the use of tungsten carbide and other hard-metal compositions and in the rate of production which the use of such hard-metal compositions in machine tools makes possible.

QUESTIONS OF LAW ILLUSTRATED

The pending indictments raise, among others, the following legal questions under the antitrust laws:

(*a*) May competitors pool patents (patents which may be competing patents) in order to obtain monopolistic control over a product indispensable to American industry, divide up the world markets between them, eliminate imports and exports to and from this country, restrict the number of producers in the United States, to a very few, limit the volume of such material produced, sold, and used in the United States to a figure insignificant compared to its availability in Germany, and establish uniform prohibitive prices for the product, and the unpatented tools containing the product, in both sales and resales?

(*b*) May such patent pool and its incidents and effects be permitted to destroy potential competition by being used as an instrumentality to coerce other competitors to come into the combination by threat of infringement suits never brought to trial, thus preventing any impartial test of the validity of the patents—especially when the patents were always of doubtful legal validity and were subsequently actually declared to be invalid when a test was finally had?

(*c*) May certain parties to such a combination seize the opportunity afforded by the terms of the patent pool agreement to fix prohibitive and discriminatory prices and to engage in other practices unfair to the other parties for the purpose and with the effect of eliminating even such limited competition and sources of supply permitted to exist by the terms of the original patent pool agreement?

(*d*) May the parties to such a patent-pooling combination, or indeed any patent owner, employ the limited monopoly conferred by the patent grant to prescribe and enforce resale prices to be observed by outright purchasers simply because the parties denominate them "agents" rather than "purchasers" and, in particular, whether such resale prices may be prescribed and maintained for the sale of unpatented materials consisting of steel shanks, etc., in a completed tool which contains as one of its parts a cutting edge manufactured from the patented product?

But even if the negative of these legal propositions is the law today, it must be obvious that they do not fully protect against the results of the activities which the evidence will disclose. It must be obvious that the antitrust laws, in the main, act only after the fact. It will be noted that the activities which were made the subject matter of these indictments were engaged in during the period from 1928 to 1940. Yet, notwithstanding vigorous prosecutions of the antitrust laws since 1935, they were not even discovered by, or made known to, the Government until the year 1940, after the basis had been laid for the damage the public is now sustaining. Furthermore, an indictment obtained in 1940 is still pending and awaiting trial. Accordingly, the circumstances about to be related may suggest to the committee the need for other provisions of law—provisions which, had they been in effect during the period in which these activities were engaged in, might have prevented them. Without necessarily recommending the adoption of any of them and recognizing that there may be countervailing considerations against their

Digitized by Google

adoption, I may say that some or all of the following suggested provisions of law, if they had been the law, might have prevented these practices in their incipiency:

(1) More stringent requirements for the obtaining of patents to prevent as far as possible the issuance of patents which will be declared invalid when tested in the courts.

(2) Clearly empowering and authorizing a governmental agency in ordinary course to call in question any patent, and to obtain a determination as to its validity and scope. This would negative a view somewhat commonly held that under existing law patents can be tested only at the election of the patent owner in a private infringement suit, unless there appears to be fraud in the obtaining of a patent, or its use to accomplish a restraint of trade.

(3) Prohibitions against pooling patents or cross-licensing under them except to avoid bona fide patent deadlocks.

(4) Complete or qualified compulsory licensing under all patents in return for reasonable royalties.

(5) Prohibitions against restrictions in licenses as to price, territory, and use.

(6) Requirements that all agreements involving patent rights be publicly registered.

(7) Measures to prevent the use of infringement proceedings to coerce persons to recognize patents.

(8) Provisions against the use of the *del credere* agency systems to maintain resale prices.

(9) Specific prohibitions against restricting the sale or use of unpatented articles composed in part of patented material.

(10) Increased penalties for engaging in restraints of trade under color of patent rights, to constitute an effective deterrent against such practices.

THE FACTS

Certain facts which the documents will disclose are as follows:

Cemented tungsten carbide was invented long ago and has been known to the art for many years. Its development as a satisfactory metal-cutting agency came in the 1920's. For a period of about a year and a half prior to November 5, 1928, American industries had a number of sources of supply of tungsten carbide and tools and dies containing this hard-metal composition. Among these sources were the Krupp Co. of Essen, Germany, and two American concerns to which Krupp was then shipping and selling outright, namely, the Union Wire Die Corporation and Thomas Prosser & Son, a partnership. Furthermore, Krupp had at that time obligated itself to grant licenses under United States patents which it claimed to own to a number of other large American concerns to manufacture and sell the product in the United States. It had in this way obligated itself to grant licenses to the Firth-Sterling Steel Co. and to the Ludlum Steel Co. During this period of a year and a half prior to November 5, 1928, tungsten carbide for use in tools and dies was being sold in the United States to consumers at about $50 a pound, a price which the General Electric Co. itself regarded as "high" even when initial development costs were contemplated.

The principal United States patents which Krupp claimed to own by virtue of an assignment from a German electric-light company, known as Osram Kommanditgesellschaft, were patents covering the supposed inventions of Baumhauer, Schroter, and Strauss. Copies of these patents will be introduced later as one exhibit No. 7. These United States patents had been previously assigned by the Osram Co. of Germany to General Electric for use in the manufacture of electric lamps. General Electric acknowledged that Krupp was entitled to these patents for all other uses. But General Electric had also developed some patents of its own, principally the Hoyt and Gilson patents, covering competing processes for the manufacture of cemented tungsten carbide. Copies of these General Electric patents will be introduced later as one exhibit No. 8. The documents will reveal that certain employees of General Electric then believed that General Electric could utilize these patents independently without infringing the competing patents claimed by Krupp. However, instead of using its patents independently in competition with Krupp, or, instead of testing out its right under the patent laws to utilize its own patents independently, General Electric worked out with Krupp during the year 1928 a cartel agreement to pool in the hands of General Electric all of the present and future patents of both parties relating to this product and to confer upon General Electric a large measure of control over the exploitation, in the United States, of all the products to which these patents related, including the power to determine sale and resales prices to be observed by itself and any companies to which it should

Digitized by Google

grant licenses and to be observed in the United States by Krupp and Krupp's licensees and dealers. This agreement of November 5, 1928, contemplated, however, that American industry should continue to enjoy at least six separate and competitive sources of supply, namely, General Electric, Krupp, Union Wire Die Corporation, Thomas Prosser & Son, Firth-Sterling Steel Co., and Ludlum Steel Co.

Nevertheless, as I have said, in the cartel agreement was a provision that all prices to the United States consumers would be fixed and made uniform and would be determined by the fiat of General Electric. It is true that the parties had in mind at that time the figure of only about $50 a pound, the market price then prevailing in the United States, as the price to be fixed by General Electric under the cartel agreement. But General Electric's and its subsidiary Carboloy's exercise of this power to fix prices one by one eliminated, or placed under strict control, these other sources of supply and brought about for General Electric and Carboloy a monopolistic control and dominance over practically the entire industry devoted to the manufacture of hard-metal compositions (tungsten, carbide, tantalum carbide, and titanium carbide) and even the unpatented tools and dies which contained parts fabricated from such hard-metal compositions.

The first step in this program was taken by Carboloy Co., Inc., a General Electric subsidiary, incorporated for the purpose of exploiting this business. Instead of prescribing the high price previously contemplated by the parties, namely a price of around $50 a pound, Carboloy fixed a price of $453 a pound, a figure about 1½ times the value of a pound of gold. The requirement that such price be observed was imposed upon Carboloy, upon the Krupp Co., and its American outlet, Thomas Prosser & Son, and also upon the Firth-Sterling Steel Co. and the Ludlum Steel Co. to which Carboloy had been obliged to grant sublicenses under the patents because of Krupp's antecedent obligation to these companies to permit them to utilize Krupp patents. General Electric contended that Krupp was obligated to impose these prices prescribed by Carboloy not only upon sales made by its future American dealers, but also upon the sales to consumers in the United States of concerns like Thomas Prosser & Son and the Union Wire Die Corporation, to which Krupp had for sometime been selling outright for resale. Union Wire Die Corporation held a contract with Krupp entered into before the pooling agreement between Krupp and General Electric had been executed whereby Union Wire Die Corporation claimed a vested right for a term of years to purchase the tungsten carbide from Krupp and to resell it in the United States free of price control and to utilize the patents claimed by Krupp in such resales of tungsten carbide in this country. Krupp was able to modify its arrangement with Thomas Prosser & Son and to make Prosser thereafter observe the prices fixed by Carboloy. Krupp claimed to lack the ability to alter the preexisting contract with Union Wire Die Corporation—and, therefore, since Krupp refused to change this contract, Carboloy proceeded to enter into additional collateral price-fixing agreements with the Union Wire Die Corporation whereby that concern became from time to time obligated to Carboloy to observe the prices promulgated by the Carboloy Co.

The indictment charges that the purpose of General Electric and Carboloy in prescribing these prohibitive prices, and the purpose of other similar restrictive activities, was to make the American market for a time so restricted in scope and so unattractive to all sources of supply, that these sources other than General Electric and Carboloy would, in time, consent to be eliminated altogether, leaving the field completely to General Electric's and Carboloy's exploitation.

These activities had that effect. No one could sell any great amounts of this material at such prices no matter how good it was and no matter how much American industry might need it. As early as 1934 General Electric and Carboloy were able, by purchase, to obtain the surrender of the license which had been granted to the Ludlum Steel Co., thereby eliminating that competitor No. 1. A similar attempt was made to induce competitor No. 2, the Firth-Sterling Steel Co., to surrender its manufacturing rights or be placed under a production quota restriction.

In the year 1936, Krupp, competitor No. 3, was induced to return for consideration, including large financial payments, to agree to refrain altogether from further importation into the United States. Krupp was permitted, however, to retain a veto power over which American concerns should thereafter be permitted to engage in the manufacture and sale of the product here.

Part of the consideration for the elimination from the American market of tungsten carbide manufactured abroad was a reciprocal undertaking that General Electric and Carboloy would not export from this country. Thus these American

Digitized by Google

companies, by contract, tied their own hands, or permitted the Germans to tie their hands, and denied foreign markets to American industry.

Carboloy Co. then acquired by purchase the businesses of competitors Nos. 4 and 5. First it bought up the business of Thomas Prosser & Son for a price ranging from $175,000 to $300,000, taking a covenant from that company to refrain thereafter from competition. In 1937, for a consideration of nearly a million dollars, Carboloy acquired the competing business of the Union Wire Die Corporation and put the principal and principal owner of that company on the pay roll of Carboloy in order to eliminate all competition from that source. Krupp cooperated with General Electric and Carboloy to induce Union Wire Die Corporation to sell out. At the instance of General Electric, Krupp then began restricting its sales to Union Wire Die Corporation and on the material it did then sell Union Wire Die Corporation it increased its price. Caught in the squeeze, Union Wire Die Corporation agreed to sell out, and its owner and president accepted an advisory job from Carboloy at $5,000 a year and covenanted to stay out of the business. As the result of these tactics General Electric and Carboloy emerged in 1936 or 1937 with virtually a complete monopoly. Then in 1936, and only then, did Carboloy reduce the fixed prices substantially. Previous reductions in price had been comparatively insignificant.

Resale prices and prices of unpatented tools were also maintained

In addition to fixing and maintaining horizontal prices for the tungsten carbide, Carboloy fixed and maintained vertical resale prices as well. This was done by requiring that established tool makers who used tungsten carbide as parts of their tools must do so only under contracts which purported to make them "agents" of the suppliers of the tungsten carbide. The provisions of such so-called agency contracts were largely ignored in practice, and it is charged that such contracts were colorable only and that the tool makers were in fact purchasing tungsten carbide outright but reselling it at fixed resale prices. The prices of the unpatented finished tools, simply because they contained parts fabricated from tungsten carbide, were likewise fixed in the same way.

The division of world territory with other German interests

In 1927 General Electric Co. and its wholly owned subsidiary, the International General Electric Co. which does all of General Electric's foreign business, entered into an agreement with another German corporation, the Allgemeine Elektricitaets Gesellschaft, whereby hard-metal compositions and tools and dies containing such compositions were included in and made subject to a subsisting agreement between General Electric, International General Electric, and Allgemeine Elektricitaets Gesellschaft, dated January 2, 1922. Thereafter, as late as October 1938, these companies supplemented, modified, and extended this agreement to run until December 31, 1955. By this agreement General Electric, International General Electric, and Carboloy obligated themselves and their controlled companies to this German concern to refrain throughout the period from 1927 to 1956 from engaging, directly or indirectly, in the manufacture or sale of all products of General Electric, patented or unpatented, in Germany (including former Austria), Danzig, and Memel, as those countries should exist from time to time. All of these countries were agreed to be within the exclusive territory of Allgemeine Elektricitaets Gesellschaft.

Allgemeine Elektricitaets Gesellschaft, in turn, obligated itself and its controlled companies to refrain from engaging, directly or indirectly, in the manufacture or sale of such products in the United States or any of its Territories, dependencies, and possessions. These agreements further expressly restricted the parties in their manufacture and sale of hard-metal compositions throughout the rest of the world. I introduce these agreements as Exhibit No. 9.

NATURE OF TUNGSTEN CARBIDE

Tungsten carbide, next to the diamond and possibly boron carbide, is said to be the hardest substance yet known to man. Pure tungsten carbide itself, however, has never been successfully used except in combination with other metals because of the fact that, although it is extremely hard, it is also very brittle and is not suitable for the manufacture of articles requiring strength and resistance to shock. Hard-metal composition of tungsten carbide used today is cemented tungsten carbide. It consists of numberless minute particles of tungsten carbide

Digitized by Google

surrounded and cemented together by a softer and tougher "binder metal," such as iron, cobalt, or nickel. A material which is said to have an appearance resembling that of cemented tungsten carbide greatly magnified is the common type of flooring material known as terrazzo. The small granite chips in such flooring material correspond to the tungsten carbide particles and the surrounding mortar corresponds to the binder metal.

The above description, however, is grossly oversimplified. There are other phenomena involved in addition to the mere cementing together of tungsten carbide particles. Even today science apparently has not discovered the entire truth concerning the physical and chemical reactions which take place when these metals are heated after having been reduced to powder form. The problems involved are extremely interesting from a technical point of view, but since this is a legal and not a scientific inquiry, I pass on to the importance of the material.

Tungsten carbide is of great industrial importance

As early as April 15, 1930, a survey was made of successful applications of tungsten carbide within the various departments of General Electric. A compilation of the data thus obtained was collected on that date. I introduce this study as exhibit No. 10. It shows that in 1929 the Schenectady works of General Electric had placed in operation approximately 10,000 carbide tools at a cost of about $5 per unit and that the resultant saving had been estimated to be about $10 per tool, or at the rate of $2 for every dollar invested in such tools. It was also reported that in the Schenectady works tungsten carbide had been used successfully in many applications involving the cutting of steel. It was reported by the Lynn River Works of General Electric that 15 of the tungsten carbide applications at that plant had been time studied, showing an annual direct labor saving of $5,200 on the 15 applications. The engineer in charge of this works predicted that when 1,000 of the machines in this plant had been equipped with tungsten carbide tools, a 10 percent direct labor saving would result, effecting an economy in the amount of $136,500 per year.

On October 29, 1931, Jeffries, then president of the Carboloy Co., prepared a comprehensive study of the past history and the future possibility of tungsten carbide. I introduce this letter as exhibit No. 11. The following excerpts from this document are of interest here:

"In estimating future possibilities three years ago, the current consumption of Carboloy tools by General Electric Company plants was used as a guide. It may be assumed that the General Electric Company does approximately one one-hundred and fiftieth of the business of the United States. If we multiply by 150 the number of pounds of Carboloy used each year by the General Electric Company, exclusive of the Incandescent Lamp Department, the amount of Carboloy consumption would be so great as to make the problem one of production rather than one of sales.

* * * * * * *

"At first thought, one might consider that the Incandescent Lamp Department of General Electric Company would not be a particularly advantageous place for large utilization of Carboloy * * * It may be of interest, therefore, to consider the consumption of Carboloy in the Incandescent Lamp Department during the first nine months of 1931. This period will be recognized as one of a low state of activity. During this period 3,469 pieces were used, totaling 45.88 kilograms. This is just about one hundred pounds, or at the rate of one hundred and thirty-three pounds per annum, or eleven pounds monthly. In tool and die form, as Carboloy is mostly sold, this amount would sell to the outside trade for about $4,000 per month. The Incandescent Lamp Department does about one one-thousandth of the total business of the United States, and consequently the $4,000 per month consumption of Carboloy by that Department, if translated to industry as a whole, would indicate a demand of $4,000,000 per month—assuming that all industry could use Carboloy in the same proportion as the Incandescent Lamp Department."

For purposes of comparison it may be noted that the total gross volume of business done by the Carboloy Co. in 1931 amounted only to $631,594.

At a meeting of the Carboloy executives on June 28, 1938, Jeffries, then chairman of the board of Carboloy, reported that "on one shell turning job the cutting time was reduced to one-sixtieth by Carboloy suppliers and this gave the incentive for every one to continue to work." The minutes recording this statement will be introduced later. In referring to "shell turning jobs" Jeffries was

Digitized by Google

speaking of the operation in which the steel projectiles for military and naval artillery shells are machined to the proper size and shape from the rough forging which represents the initial stage in the manufacture of such projectiles. This is a particularly difficult machine operation in view of the fact that large quantities of metal must often be removed from the rough forging and because such projectiles are manufactured from extremely hard metal. The affidavit which was submitted to the District Court of the Southern District of New York on July 14, 1941, by Robbins, president of Carboloy, and which I have already introduced as exhibit No. 6, contains the following:

"Cemented tungsten carbide is important in defense industries because it is so much harder and wear-resistant than high-speed steel that it will perform most cutting operations at four times the speed of high-speed steel. A tool tipped with cemented carbide will retain its sharpness many times longer than a tool of high-speed steel. Thus a carbide tool further increases production by conservation of time lost in removing, sharpening and resetting a tool in the machine. When cemented carbide tools are used in a plant the productive capacity of the machines tooled with these tools is increased by 15 to 25% above its capacity with the use of high-speed steel tools."

In a letter to the office of the Chief of Ordnance of the United States Army, dated December 21, 1939, Robbins stated that the production from many machine tools in the United States could be increased as much as 50 percent merely by changing from the ordinary cutting tools to tools employing tungsten carbide. I introduce this letter as exhibit 12.

The use of tungsten in tungsten carbide conserves the metal, tungsten, which is scarce

In a letter to the Assistant Secretary of War, dated October 9, 1939, Jeffries, chairman of the board of Carboloy, stated that a pound of tungsten would go further in industrial production in the form of cemented carbide than in the form of high-speed steel or stellite. He said that the extent of this superiority in some cases is at least 100 to 1. I introduce this letter as exhibit No. 13. A similar representation was made by Robbins, president of Carboloy, on December 21, 1939, in his letter to the office of the Chief of Ordnance of the United States Army which has just been introduced as exhibit No. 12.

The affidavit submitted by Robbins to the District Court for the Southern District of New York on July 14, 1941, introduced as exhibit 6, also contains the following:

"Tungsten, a vital war material, is utilized far more efficiently in tungsten carbide than in high-speed steel. It has been estimated that a pound of tungsten used in tungsten carbide for cutting tools can produce from 20 to 50 times as much production as a pound of tungsten used in high-speed steel."

These facts are important when the necessity of conserving the metal, tungsten, is appreciated. The President has issued an Executive order forbidding the export from the United States except upon license issued by the Secretary of State. I introduce this as exhibit No. 14, Executive order from 5 Federal Register, p. 2469, July 4, 1940.

Cemented tungsten carbide has long been known to the art

The substance, tungsten carbide, has been generally known to the science of metallurgy since approximately 1898 when a Frenchman named Moissan published a book describing his experiments with tungsten carbide and the properties of this composition. Before many years had passed, numerous attempts had been made to utilize in practical form the quality of extreme hardness which characterized this unusual material. Most of the early attempts were marked by attempts to mix tungsten carbide with other metals in such a way as to preserve the hardness of the tungsten carbide and yet obtain a substance which was tough and durable. Many such practical materials were made and patented before 1920. An example of this type of product is that patented by Coles and Donaldson. This product was formed by melting tungsten carbide and nickel and casting the same in the form of sheets. This substance was successfully used in the manufacture of burglarproof safe doors for a considerable number of years.

The difficulty with the cast products lay in the fault of all cast materials, namely, that although quite hard they were also too brittle to be used for many purposes where strength and resistance to shock were necessary. The next group of such products which were developed, therefore, embodied attempts to

Digitized by Google

obviate the necessity of melting and casting the product. In 1914 and 1916 two patents were issued in Germany to Voigtlander and Lohmann on several different materials, among which was a composition of tungsten carbide and a more ductile metal manufactured by a process which is sometimes described as sintering. One of these patents contains the interesting observation that it was already old in the art to add metal substances to hard carbides to be used as a binder. In 1920 an American patent was granted to Liebman and Laise on materials similar to those described by Voigtlander and Lohmann but superior thereto because of an improved technique and a formula calling for a larger amount of the binder metal.

The patent pool here involved did not contain or rest upon these patents. They are mentioned here as bearing upon the validity of the patents which were pooled. I shall introduce later copies of these early patents, to Coles and Donaldson, to Voigtlander and Lohmann and to Liebman and Laise, as one exhibit No. 15.

In 1924 a United States patent was granted to Baumhauer on a superior technique which utilized substantially the same materials as those disclosed by Liebman and Laise and Voigtlander and Lohmann, and in 1925 a United States patent was granted to Schroter on a material which was also similar to that covered by earlier inventions but which represented an improvement on the prior art by reason of its specification of the proportions of the different ingredients to be used and other details of the sintering operation.

But up until about 1927 no commercially successful product had been developed and it was only in about the year 1927 that mechanical skill and practical knowledge had reached a point where it was possible to utilize in the production of a commercially successful product this long series of disclosures and developments in the art. These improvements, which represented the difference between laboratory and factory processes were nevertheless merely improvements in mechanical skill in handling the ingredients. These mechanical improvements related to techniques in grinding or pulverizing the ingredients to be used and in the determination of the most suitable proportions of materials and the optimum figures of time and temperature used in the final heating process.

The pooled patents, including the Schroter patent, therefore, added nothing of patentable novelty to the art. They were bound to be held invalid as soon as they should be tested in court. The aforesaid evolution of the mechanical application of the substance was expertly and authoritatively discussed by the District Court of the United States for the Eastern District of Michigan which in 1940 held invalid six of the so-called basic patents upon which the patent pool was constructed. This was the first case involving a test of the pooled patents which had been permitted to come to trial. District Judge Tuttle in that case stated that the history of the art showed that at no single point had a "revolution" taken place which gave to science and the public any substantial novel development, and he described the process which had taken place as merely one of technological "evolution." It was upon this premise that he held, as one of the reasons for invalidating all the patents in suit, that those patents did not disclose enough of novelty to the public to justify the public in granting any exclusive "franchise" in return. He added that whatever contributions were represented by the pooled patents consisted only in the treatment of well-known combinations of materials by metallurgical processes which were equally well-known. It is important to note, therefore, that while it has been the legal contention of the Department of Justice that the activities under this cartel agreement were violative of the Sherman Act even upon the assumption that all of the patents pooled were valid, the principal patents supporting this structure were in 1940 held by a United States District Court to have been at all times null and void, because lacking in patentable invention. Judge Tuttle's opinion was rendered in the case entitled *General Electric Company et al* v. *Industrial Diamond Co., et al.* (33 F. Supp. 969). From this decision the owners of the patents took no appeal.

Initial formation of the patent pool by the agreement between Krupp and General Electric dated November 5, 1928

Krupp's letter to General Electric, dated September 13, 1927, embodies perhaps the earliest proposals which were made between the parties for a patent pooling agreement. In this letter Krupp stated that it was prepared to grant a manu-

Digitized by Google

facturing license to General Electric under the patents Krupp had obtained from Osram on the following terms:

(*a*) that Krupp be allowed to sell in the United States;

(*b*) that there be an exchange of patents and technical information;

(*c*) that a royalty of one-third of General Electric's net proceeds be paid to Krupp;

(*d*) that Krupp have the right to grant other manufacturing licenses if General Electric's sales did not reach a certain amount by a stipulated time;

(*e*) that prices be agreed upon.

I introduce this letter as exhibit No. 16.

On April 17, 1928, a meeting was held between certain representatives of General Electric and Krupp in which a draft of tentative agreement between the two companies was prepared. In this draft it was recited that "the patents now owned by Krupp and by the General Electric Co. should be combined and the entire situation should be turned over to the General Electric Co. for handling in the United States." The procedure was then briefly outlined with respect to the licenses to be granted, the royalties to be paid, and the manner in which the technical information was to be exchanged. Provision was made for importation by Krupp into the United States until the end of 1930 or until royalties paid Krupp should reach a stipulated figure. I introduced this tentative agreement as exhibit No. 17.

Krupp's reaction to the draft of agreement prepared on April 17, 1928, is shown in its letter to General Electric, dated June 14, 1928. Although an agreement on the principles was expressed, numerous suggestions regarding changes were proposed as follows: (1) That Krupp be permitted to sell in the United States for an unlimited period, and (2) that a price-fixing provision be incorporated in spite of General Electric's reluctance based upon the antitrust laws. I introduce this letter as exhibit No. 18. A letter from Stearns of General Electric to Preussing of Krupp, dated October 3, 1928, states in detail several reasons why Krupp should not plan to import hard metal composition into the United States. I introduce this letter as exhibit No. 19.

On November 5, 1928, General Electric and Krupp entered into a written agreement which I introduce as exhibit No. 20. This agreement purported to take effect on April 17, 1928, and to run for a term of 15 years from the date thereof, and thereafter until terminated by 6 months' notice in writing by either party to the other. By this agreement all of Krupp's alleged rights under certain United States letters patent and patent applications and all other United States letters patent relating to hard metal composition which would be owned or controlled by Krupp at any time during the life of the agreement, and certain applications for United States letters patent belonging to General Electric and all other United States letters patent relating to hard metal composiions which should be owned or controlled by General Electric at any time during the life of said agreement or pooled in the hands of General Electric. The said agreement imposed upon the parties entering into it the following restrictions and obligations, among others:

(1) General Electric was obligated to prescribe and fix the prices and terms and conditions of sale under which all such hard metal compositions and hard-metal composition products could be sold and resold in the United States.

(2) General Electric was obligated to arrange for the exploitation in the United States of such hard metal composition of a performing quality comparable to the hard metal compositions then being manfactured by Krupp, by granting nonexclusive licenses to manufacture, use, and sell hard metal compositions and products containing such hard metal compositions under the alleged patent rights included in or to come into said patent pool to a number of manufacturers in the United States, including Ludlum Steel Co., and Firth-Sterling Steel Co.

(3) General Electric was obligated to pay to Krupp certain specified money, the amount of which was to be determined by the amount of all such hard metal compositions sold by it or any of its licensees.

(4) Krupp was obligated to refrain from manufacturing any such hard metal compositions or hard metal-composition products in the United States.

(5) Krupp agreed that hard metal compositions and hard-metal composition products of its manufacture which should be imported into the United States would be resold in the United States at prices and on terms and conditions of sale determined and prescribed by General Electric, and that it would require Gewerkschaft Wallram, in turn, to require the dealers and distributors of

Digitized by Google

Gewerkschaft Wallram in the United States to observe and adhere to such prices and terms and conditions of sale in their resales of such dies within the United States; Krupp was also obligated to make contracts with all of its importers (dealers and distributors, including tool makers and die makers) located in the United States to which it should sell outright and such hard-metal compositions and hard-metal composition products, in form satisfactory to General Electric, requiring such importers in turn, to observe and adhere to such prices and terms and conditions of sale in any resales which said importers should make of such hard metal compositions and hard-metal composition products, and in any sales of tools and dies embodying hard metal compositions manufactured by said importers.

(6 Both General Electric and Krupp were obligated to pool technical information relating to hard-metal compositions and hard-metal composition products, and to cause their respective employees to disclose to them any inventions which said employees might make relating to such hard-metal compositions and to assign said inventions to General Electric and Krupp, respectively, and any United States rights to such inventions would thereupon be included in said patent pool.

In the same year, 1928, General Electric caused its subsidiary, Carboloy, to be incorporated, and Carboloy undertook to carry out the obligations of General Electric under General Electric's pooling agreement with Krupp.

1936 amendment to the pooling agreement

On April 23, 1936, General Electric and Carboloy entered into a written agreement with Krupp which I introduce as exhibit 21, amending the pooling agreement of November 5, 1928, whereby, in return for increased payments of money, Krupp agreed from and after said date to refrain from selling or shipping tungsten carbide tools containing the same to or for sale in the United States, and from and after July 7, 1937, to refrain from selling or shipping nibs fabricated from tungsten carbide and dies containing such nibs to Union Wire Die Corporation and whereby General Electric and Carboloy agreed to refrain thereafter from exporting any hard-metal compositions and products from the United States to persons located in foreign countries. General Electric and Carboloy agreed not to license or permit any other person to manufacture or sell such hard-metal compositions and hard-metal composition products in the United States without the approval of Krupp. On or about April 23, 1936, General Electric and Carboloy agreed with Krupp that Carboloy would purchase from Union Wire Die Corporation and from Thomas Prosser & Son their respective businesses.

Carboloy granted licenses only to companies which Krupp was already obligated to license and to three alleged infringers of the pooled patents

Firth-Sterling Steel Co. and the Ludlum Steel Co. were issued licenses by Carboloy in January 1929.

It appears that during the period preceding the pooling agreement between Krupp and General Electric that Krupp had obligated itself to grant licenses to these companies. The letter of Stearns, manager of special contracts of General Electric, to Swope, president of General Electric, August 3, 1928, contains the following:

"Before making a trade with the General Electric Krupp had committed itself to granting licenses in the United States for the manufacture and sale of carboloy, to the following firms: Ludlum Steel Company; Firth-Sterling Steel Company; * * *."

I introduce this letter as exhibit No. 22.

The obligation of General Electric to Krupp to grant licenses to Firth and Ludlum was expressly recited in article IV of the General Electric-Krupp agreement of November 5, 1928, already introduced as exhibit No. 20, as follows:

"THE GENERAL COMPANY agrees to arrange for the diligent exploitation in the United States for hard-metal composition as herein defined, of a quality comparable to the hard-metal composition now being manufactured by the KRUPP COMPANY in Germany in the form of tools and dies or parts thereof. This shall be done either by granting nonexclusive licenses to manufacture, use, and sell under patent rights within the scope of this agreement to a reasonable number of reputable manufacturers in the United States, including

Digitized by Google

Ludlum Steel Company and Firth-Sterling Company, or in such manner as shall be agreed upon by the parties hereto.

The license agreements to the Firth and Ludlum Companies, which were dated January 2, 1929, and January 16, 1929, respectively, are typical cross-licensing agreements involving the reciprocal grants of patent rights, royalty payments, reports by each party, exchange of technical information, admissions of validity of patents and cancellation and arbitration provisions. It is noteworthy, however, that it is provided in article VI of these agreements that the licensee is required to adhere to the prices and terms and condititions of sale to be promulgated from time to time by Carboloy. I introduce a copy of the license to Firth-Sterling Co. as exhibit No. 23.

As has been stated, General Electric and Carboloy claimed that other manufacturers not in the combine were "infringers" of the pooled patents and by the threat or institution of numerous patent suits drove some of them from the field. But no infringement suits were permitted to be brought to trial during the period 1927 to 1940. Instead where threats failed to eliminate three such manufacturers, all price competition from these three alleged "infringers" was eliminated, and other competition offered by them substantially hamstrung, by bringing them into the combination through the simple expedient of giving them restrictive licenses. These manufacturers were granted sublicenses by the Carboloy Co. under the pooled patents whereby (*a*) the pool was augmented by the acquisition of rights under the patents owned by the alleged "infringers," and (*b*) the sublicensees, and their products which would have competed with tungsten carbide such as tantalum carbide and titanium carbide, were placed under the strict control as to prices and production quotas prescribed by Carboloy.

For example, American Cutting Alloys Co. and American Electro Metal Co., having first begun to manufacture Cutanit, a material consisting of titanium carbide, under their own patents, were brought under control by receiving in 1933 a license from Carboloy under the pooled patents wherein their manufacture was restricted to titanium carbide and their prices made to conform. The negotiations which preceded the issuance of this license agreement were opened by a letter from Oppenheimer, patent attorney for American, to Carboloy, dated August 20, 1932, which I introduce as exhibit No. 24. This letter is noteworthy in that it alleges that Carboloy's pooled patents were "not to be upheld in court over the prior art" known to the American group. A letter from Mallory, president of Carboloy, to Jefferies, dated August 23, 1932, urges that some arrangement be made to assure control over the new product being introduced by this American group. The following paragraph from this letter, which I introduce as exhibit No. 25, is interesting:

"While the chances are that this material will not prove as significant as a cure-all for all cutting problems, nevertheless I am pretty thoroughly convinced that the tests that they do make and the discussions that they will have during their trip with various interests who are anxious to break down the Carboloy picture will make it more difficult for you to deal with them later than it will be at this time. Take the case of Fansteel for instance. Fansteel has everything to gain and nothing to lose by tying up with them. Fansteel's patent attorney will unquestionably tell them that the Carboloy patents are not broad enough to cover this development. Fansteel can make them all kinds of promises and I am sure will do so."

Jeffries, president of Carboloy, wrote to Stearns, of General Electric, on September 27, 1932, with reference to his conversation with Mr. Firth on this subject, as follows:

"He [Firth] was told, of course, that our first objective would be to bring the Cutanit material under price control and into the patent picture in such a manner that it could be manufactured by the licensees. Naturally, we told him that the licensees could proceed at once to manufacture and sell the material because it comes under claims of patents under which they are already licensed."

Jeffries' letter to Templeton, of Ludlum Steel, October 7, 1932, contains the following:

"I stated that our first objective would be to try to secure the complete patent rights on Cutanit provided, of course, the material looks sufficiently interesting and provided that suitable terms can be arranged. * * *

"Our second objective, if we cannot obtain the first, would be to put Cutanit under price control. * * *"

These letters are introduced as exhibits No. 26 and No. 27.

Digitized by Google

Accordingly, on April 20, 1933, an agreement was entered into between Carboloy, the American Electro Metal Corporation, and the American Cutting Alloys, Inc. This license agreement is similar to that granted to Ludlum and Firth with the exception that it is limited in its scope to compositions containing at least 16 percent by weight of any one or any combination of the following metals: Titanium, vanadium, zirconium, boron, or silicon. I introduce it as exhibit No. 28.

Companies composing the so-called Fansteel group, having first begun to manufacture tantalum carbide under their own patents were brought under control by receiving a license from Carboloy under the pooled patents wherein their manufacture was restricted to tantalum carbide and their prices made uniform.

About in 1931, the General Motors Corporation obtained a preferential contract for the purchase of tungsten carbide from the Firth-Sterling Steel Co. After the cancelation of this contract was required by Carboloy, General Motors began to buy a new tantalum carbide called Ramet from the Fansteel group of companies. The letter of Jeffries, president of Carboloy, to Swope, president of General Electrict, August 2, 1932, contains the following:

"You will be interested to know that the General Motors-Firth Sterling contract was cancelled according to schedule on June 30. * * * Apparently the Divisions were glad to see this agency cancelled. On the other hand, the General Motors Research Corporation is not pleased with this action, and we have heard rumors that they will manufacture and sell tools made of Ramet, an infringing material made by Fansteel Products Corporation, against whom we have filed a suit."

I introduce this letter as exhibit No. 29. Thereafter, on August 8, 1933, an agreement was made between General Electric and Carboloy on the one hand and the Fansteel Products Co., Inc., the Ramet Corporation of America, and the Vanadium Alloys Steel Co. on the other, under which the latter group was licensed to make certain hard metal compositions under the pooled patents. This cross-licensing agreement is somewhat similar to the preceding licenses granted by Carboloy in that it is a cross-licensing arrangement involving royalties, reports, price-fixing, etc. However, it is noteworthy in that the agreement permits the manufacture of only that hard metal composition which contains at least 17 percent by weight of tantalum carbide or the molecular equivalent in columbium carbide or a combination of the two.

The only other license granted by Carboloy was one to the Eisler Electric Co. in 1934. A letter of Jeffries, president of Carboloy, to Stearns, of General Electric, August 8, 1934, is explanatory of this situation.

"The situation with respect to the Eisler Electric Corporation is about as follows:

"The main outlet for cemented tungsten carbide manufactured by Eisler is the Super-Tool Company, headed by Mr. Bergbauer, of Detroit. We filed a suit against Bergbauer and the Super-Tool Company in the Fall of 1932, and there is no chance of reaching a trial prior to the Fall of 1934 and perhaps little chance of a decision prior to some time in 1935 or even later. Since this suit was filed the Eisler Corporation has developed some additional outlets so that the winning of the Detroit suit would not effectively terminate the operations of Eisler. There is no suit against the Eisler Corporation, for reasons which our attorneys can give better than I can. The New Jersey District is considered quite unfavorable from the standpoint of patent litigation and we would run the risk of throwing the whole patent situation wide open following suit against Eisler in New Jersey.

"The commercial activities of the Super-Tool Company and the other outlets for Eisler cemented carbide have been quite vigorous during the past few months, and the licensees of Carboloy Company have entered many complaints and have sent in SOS signals asking that we do something, if possible immediately to take care of the Eisler low-price competition. Of course, there is only one way to handle the situation surely and quickly, and that is by a license, provided the Eisler Electric Corporation will take a license substantially under our terms."

I introduce this letter as exhibit No. 30.

Jeffries had previously referred to the pending litigation between Carboloy and the Eisler Co. and its customer, the Super-Tool Co. of Detroit, in a letter to Birge, vice president of General Electric, dated March 8, 1934, as follows:

"I have been connected with a number of patent suits during the past two years and have observed a number of others. I have also talked with several prominent patent attorneys. I have in mind, too, the decisions of the Supreme Court

Digitized by Google

during the past four or five years relating to patents. There seems to be a definite tendency to invalidate patents in the courts at the present time. My thought is that the courts will be more adverse to patents rather than otherwise during the forthcoming months. * * *

"The above has a definite bearing on the policy of the Carboloy Company with respect to the prosecution of the Super-Tool suit in Detroit * * *

* * * * * * *

"I do not wish to assume responsibility for continuing the Super-Todd suit, feeling as I do about it, and therefore I think it desirable that we discuss this matter frankly and thoroughly with Mr. Swope."

I introduce this letter as exhibit No. 31.

Accordingly, on October 4, 1934, an agreement was entered into between Carboloy and the Eisler Electric Co. I introduce this license agreement as exhibit No. 32. This agreement is also of the same general type as those entered into between Carboloy and Firth and Ludlum in 1929. The principal and most noteworthy difference, however, is that article III of the agreement limits the licensee in the amount of hard metal composition it may sell to a minimum quota of 750 pounds per year, or 5 percent of the total production of Carboloy and its licensees, whichever shall be the greater.

In each one of the five licensees which were granted under the pooled patents the licensee was in turn required to license Carboloy under its patents. In each instance the licensee was prevented from exporting and in each instance the licensee was required to submit to the fixing of prices by Carboloy.

Refusals to license

On the other hand, a number of applications by American concerns for licenses to manufacture tungsten carbide under the pooled patents were refused.

A request for license by the Crucible Steel Co. was refused in 1936. Carboloy's refusal is embodied in the letter of Robbins, president of Carboloy, to Aranson of Crucible Steel, dated April 15, 1936. I introduce this letter as exhibit No. 33. Another request by Crucible is contained in the letters from Desvernine representing Crucible to Swope, president of General Electric, dated October 28, 1937, and November 10, 1937. I introduce these letters as exhibits Nos. 34 and 35. Such a license was not granted.

A request by the Chrysler Corporation for a license is contained in the letter from Harris, patent attorney for Chrysler, to the Patent Department of General Electric, dated October 5, 1938. Its refusal is expressed in Morrison's letter to Harris, October 10, 1938. I introduce these letters as exhibits Nos. 36 and 37.

That a request for license by the Triplett Electrical Instrument Co. was refused is shown by the letter of R. A. Warner to that company dated April 25, 1940. I introduce this letter as exhibit No. 38.

The letter from Robbins, president of Carboloy, to Erlicher of General Electric, dated April 24, 1935, contains the following:

"At the very inception of the use of tungsten carbide at the American Steel & Wire Company mills, American Steel & Wire Company approached us for a license to manufacture Carboloy wire-drawing dies. This license was naturally refused by us since we could not justify a license to one large user and expect other large users to buy from us at our listed prices."

I introduce this letter as exhibit No. 39.

A letter of Morrison, patent attorney of General Electric, to Shreve, a General Electric vice president, dated September 22, 1938, shows that a license was also refused to the General Cable Co. I introduce this letter as exhibit No. 40.

The Ford Motor Co. for a considerable period of years expressed strong opposition to the high-price policy being followed by the Carboloy Co. and at one point it made a request for the right to manufacture for its own use. The letter from Robbins, president of Carboloy, to Jeffries, chairman of the board of Carboloy, dated March 4, 1936, is illustrative:

"With reference to the matter of the request for shop rights for the manufacture of cemented carbide by the Ford Motor Company. We have not received a formal written request from Ford as yet but they have been repeatedly after us to answer in writing and I have insisted that they must make a formal request before I will answer in writing. I have done this mainly to stall off the proposition.

"I hesitate, even upon the receipt of a written request from Ford, to answer this. The nature of the answer may have a far-reaching effect particularly

Digitized by Google

to further disturb the Ford Motor situation. How would you feel about advising the Ford Motor Company when we do receive their request that we would like to operate in the capacity of being as cooperative as we can with regard to handling the matter, with them and then close up by telling them that we will be glad to discuss the matter with them in great detail at their convenience?

"It is my thought that by handling the matter in this way we have not definitely turned the Ford Motor Company down, thereby further upsetting the picture and at the same time we have left the door open to come into Ford's and give them a full picture of the situation. It is my hope that by the time the request comes that we can give them some kind of a picture of the recent Krupp matter along with some of our plans for the future. Tnen I believe would be the time to explain the complicated license set-up under which we operate and to give Ford the reasons why we prefer not to grant the shop right."

I introduce this letter as exhibit No. 41.

Philip McKenna

For a number of years an inventor named Philip McKenna was connected with the Vanadium Alloys Steel Co., a Carboloy licensee. His contract of employment provided that all patents developed by him in the course of his employment were to be assigned to the Vanadium Co. In 1938, however, McKenna terminated his employment with Vanadium claiming that the company had breached its employment contract with him. He took with him several of his patents and patent applications covering processes for manufacturing hard metal composition without assigning them to the Vanadium Co., claiming that because of Vanadium's breach of contract he was no longer obligated to do so. He then began the independent manufacture of various types of tungsten carbide, tantalum carbide, and titanium carbide in competition with Carboloy. Because his competition disturbed the artificial price level established by Carboloy, that company was anxious to bring him under price control. This was finally accomplished, not by any patent infringement suit or even by any threat of such litigation, but by pressure brought by Carboloy on its licensees, the Vanadium Alloys Steel Co. and the Vascoloy-Ramet Corporation, to require McKenna to assign his patents to the Vanadium Co. in accordance with the terms of his former employment contract. After this had been accomplished these patents also were added to the pool.

The first step in this procedure was taken on April 28, 1938, when Robbins, president of Carboloy, wrote to Aitchison, president of Vascoloy-Ramet Corporation, as follows:

"In connection with the same matter I have been called upon by the Patent Department of the General Electric Company regarding the two patents which were recently issued to Philip McKenna which you spoke to me about. They are quite insistent that something be done about this matter and I would like advice from you as to what is being done."

I introduce this letter as exhibit No. 42.

Accordingly, an agreement was entered into between Vascoloy-Ramet Corporation, Fansteel Metallurgical Corporation, the Ramet Corporation of America, and Vanadium Alloys Steel Co., one of the provisions of which was as follows:

"Vanadium agrees that it will promptly endeavor to obtain from Philip M. McKenna an assignment of all United States and Canadian Letters Patent, whether now or hereafter issued upon application heretofore filed, covering or disclosing any inventions or processes relating to Bonded Hard Metal Compositions and/or the products thereof and/or any and all improvements thereon; and Vanadium agrees that in the event that it shall fail to obtain such assignment within sixty (60) days from the date hereof, then Vanadium shall immediately, without expense to Fansteel, Ramet or Vascoloy Ramet, for the purpose of obtaining such assignment, institute and prosecute with diligence appropriate legal proceedings either in its own name alone or in its own name jointly with any of the following: Vascoloy-Ramet, Fansteel, Ramet and/or Carboloy Company, Inc. If and to the extent necessary to assist Vanadium in obtaining such assignment amicably within such sixty-day period, Vascoloy-Ramet will agree to pay to Philip M. McKenna a royalty not to exceed two per cent (2%) of Vascoloy-Ramet's net sale price on all grades "E" and "EE" Bonded Hard Metal Composition made by Vascoloy-Ramet under the teachings of the Philip M. McKenna patents so assigned, relating specifically to such grades and sold after the date of this agreement, and Vanadium will agree to pay Philip M. McKenna a royalty not to exceed two per cent (2%) of Vanadium's net sale price on all

Digitized by Google

Bonded Hard Metal Composition other than grades "E" and "EE" made by Vascoloy-Ramet under the teachings of the Philip M. McKenna patents so assigned, relating to such other grades and sold by Vanadium after the date of this agreement, but the form of any such agreement shall first be approved by the respective counsel for Vascoloy-Ramet and Vanadium."

I introduce this agreement as exhibit No. 43.

Thereafter, litigation was instituted by the Vanadium Co. against McKenna which was terminated by an agreement dated October 27, 1939, by which the McKenna patents were assigned to the Vanadium Co., McKenna taking back a free nonexclusive license under which he was bound to sell at the same prices as the Vanadium Co. In view of the fact that Vanadium was also a Carboloy licensee, its prices were, of course, Carboloy prices.

On December 7, 1939, Jeffries, chairman of the board of Carboloy, wrote to Morrison, of General Electric, with reference to the above agreement, stating that "The settlement is not quite the one that Mr. Robbins and I said would be agreeable to the Carboloy Co." He also stated, however, that the agreement was adequate to satisfy Carboloy's demands. He also noted that Carboloy did not use any of the McKenna patents at present and that it had no present intention of doing so. I introduce this letter as exhibit No. 44.

Thus General Electric and Carboloy have placed under price control an independent manufacturer producing under his own independent patents. General Electric and Carboloy have also obtained additional patent rights with which to promote and perpetuate its monopoly.

Prices maintained as the result of the patent pool—Comparison with German prices

I introduce as exhibit No. 45 a chart prepared in the Department of Justice entitled "Carboloy Co. Price For Tungsten Carbide Since 1928."

This graph was prepared on the basis of price information furnished to the Department of Justice by the Carboloy Co. and other producers in the industry. The low prices prevailing in 1927 and 1928 represented the first sales made in this country by Thomas Prosser & Son, of New York, a Krupp importer. The vertical line at the left of the chart represents the increase in the American price level which took place immediately after the execution on November 5, 1928, of the patent pooling agreement. You will note that the chart from that time on shows the maximum prices on the top line and the minimum prices on the lower line, which is broken.

During 1929 and early 1930, the maximum price was at the rate of $453 a pound, and the minimum price was at the rate of about $360 a pound. This minimum price was granted on orders amounting to $20,000 or more. From the middle of 1930 to the middle of 1932, the maximum price continued to be $453 a pound, but the minimum price dropped to about $225 a pound. During this period the minimum price was charged for pieces of tungsten carbide weighing at least 1,000 grams. As pieces of such size were probably never made at that time, it is apparent that the $1 per gram price remained substantially unchanged. From the middle of 1932 until October 1, 1936, the maximum price continued at $453 a pound, but a slightly lower minimum price was granted on pieces of 100 grams or more. However, during this period, some additional concessions on price were made by granting larger discounts for quantity purchases.

The spectacular drop in the maximum price which came on October 1, 1936, followed the elimination of Krupp and its dealers from the American market. At this time Carboloy abandoned its former practice of granting lower per gram prices for larger pieces and maintained its maximum price of slightly more than $200 per pound for prices of all sizes and granting discounts therefrom entirely upon the basis of the amount of business done by the individual purchaser. During the period from October 1, 1936, until the date of the first indictment, August 30, 1940, prices very near the maximum were charged to almost all purchasers, and prices near the minimum were granted to only a very few large quantity purchasers, such as General Motors, Ford, and similar concerns.

The dotted line showing the 1928–35 average price is based upon data from the files of the Carboloy Co. In no sense should this line be interpreted to indicate that the average price during those years remained constant. If complete data were at hand, the line representing the average price could be drawn to show a price of $453 in 1929, which was gradually reduced until in 1936 it would be about $225.

Digitized by Google

The individual points shown in the period from 1937 into 1940 represent average price figures on sales by the Carboloy Co. at the time in question. During this period Carboloy reported to Krupp the number of pounds of material which it sold, together with the total sales price of such material. From these two figures it is simple to compute the average price per pound of material sold. It should be pointed out, however, that the average price charged by Carboloy during this period was substantially lower than the average prices charged by Carboloy licensees by reason of the fact that Carboloy served the larger customers at large discounts, leaving the smaller purchasers to be served at prices near the maximum by its licensees.

On August 30, 1940, the first indictment was returned. On the following business day the various companies in the industry announced new and substantially reduced prices. I introduce as exhibit No. 46 a circular letter from the Firth-Sterling Steel Co. to its customers informing them that new and lower prices would shortly be announced in view of the action of the Department of Justice and the invalidation of the Carboloy patents.

Because the industry pricing practices have, since September 1, 1940, become even more complicated, it is not practical to show maximum and minimum prices for the period of time since that date. Suffice it to say that the market broke sharply. The dotted line shown on the chart represents the average price figure determined in early 1941 by the Firth-Sterling Steel Co. with relation to its own sales. It is probable that prices charged by the Carboloy Co. have been even lower in view of Carboloy's larger volume.

I now introduce as exhibit No. 47 a chart entitled "Comparison of German and American Prices in 1935." This chart is an enlarged reproduction prepared by the Department of Justice of a chart prepared by the Carboloy Co. on October 24, 1935. The conclusion to be gathered from this chart is obvious. For example, a piece of tungsten carbide weighing 10 grams, which is the average size piece used by American industry, would cost in the United States approximately $8; while its price in Germany would be approximately $1.75. Similarly, a piece of tungsten carbide weighing 20 grams, which sold in Germany for about $2, was priced in 1935 in the United States at about $12.50.

I now introduce as exhibit No. 48 a chart entitled "Comparison of German and American Prices in 1939." This chart was prepared by the Department of Justice on the basis of data contained in a letter to Robbins, president of Carboloy, from Ritner, his assistant, dated June 9, 1939. This letter states that the data contained therein were obtained from a letter from Dr. Ammann, director of Krupp, dated May 10, 1939. I introduce the letter to Robbins as exhibit No. 49. As may be seen, Carboloy's prices in 1939 were based upon the quantity purchased by the customer in an individual order. As I have stated previously, the lowest prices at this time were granted only to a very few large consumers, such as Ford and General Motors; while the rank and file of factories and machine shops purchased at or near the maximum price. In order to explain the chart, I quote two specific examples of figures shown. In the case of a 10-gram piece which, as I stated before, is a piece of average size, the price in Germany was $1.40, while the price in the United States varied from $2.10 to $4.50, depending upon the number of identical pieces purchased at one time. Similarly, in the case of a 20-gram piece, the price in Germany was $2.24; while the prices in the United States ranged from $4.20 to $9.

High prices established and maintained by the patent pool greatly restricted American manufacture and use of tungsten carbide and machine tools containing it—they brought about the elimination of competition with General Electric

In 1928 while the pooling agreement was being negotiated, General Electric suggested to Krupp that a minimum price of $50 per pound as the one to be established. This was the prevailing market price at this time in the United States. They then had in mind the extra costs of introduction and early exploitation. The letter of Stearns, manager of special contracts of General Electric, to Preussing, director of Krupp, dated October 3, 1928, which I introduce as exhibit No. 50, contains the following:

"You will recall that at the time of our conference we suggested a minimum price of $50 a pound for hard metal composition—when sold as such. * * *"

That this figure had been fully discussed amongst the officials of General Electric is shown by the letter of Carboloy's first president, Mallory, to Stearns

Digitized by Google

of General Electric, dated July 26, 1928, in which he suggested that the basic price for tungsten carbide should be about $50 per pound. I introduce this letter as exhibit No. 51. Mallory remarked that "* * * on account of the high price of the product and the unusual opportunity for profit the temptation for bootlegging activities will be great." Mallory suggested this "high" price when he was fully aware of the practical difficulties attending the introduction of a new and radically different product such as tungsten carbide. He stated:

"At this time I want to go on record that the sales problem involved in commercializing Carboloy is a difficult one."

Notwithstanding these suggestions as to the proper price, General Electric, through Carboloy, immediately after the execution of the pooling agreement November 5, 1928, established a price of $453 a pound to be observed by itself and its licensees and by Krupp and Krupp's dealers. Such a price could not be justified by the cost of manufacturing the product. The Department has been informed that cost of producing tungsten carbide in 1940 was approximately 5 cents per gram or $23 per pound. The letter from a General Electric engineer, LeFevre, to Birge, a General Electric vice president, dated March 15, 1930, which I introduce as exhibit No. 52, set forth that tungsten carbide was then being produced in the General Electric Schenectady works for a cost of about $12 per pound, but that the production cost in the Cleveland wire works of General Electric, which produced the metal for the Carboloy Co., was at the rate of $28.80 per pound.

The memorandum by Jeffries, then president of Carboloy, of his discussion with Dr. Ernst Ammann, the director of Krupp in charge of tungsten carbide manufacturing, dated October 15, 1935, which I introduce as exhibit No. 53, reports that Germany was consuming each month an amount of tungsten carbide (about 8,000 pounds) equal to the American consumption for an entire year. He stated that, assuming the full effect of the recent devaluation of the dollar, the total cash return to the American manufacturers was about 65 percent of the German dollar volume, but that, giving no consideration to the devaluation, the dollar volume in each country was approximately the same.

The letter of Jeffries, then president of Carboloy, to Swope, then president of the General Electric Co., dated December 24, 1936, which I introduce as exhibit No. 54, contains the following:

"Europe is consuming nearly eight times the poundage of cemented carbide that is consumed in the United States and Canada. Our gross revenues are probably fifty or sixty percent of those of the Europeans. There is much further room for price reduction and, in fact, price reductions must be made regularly between now and 1943 when the main patent expires."

A paper submitted to General Electric after 1936 by Dr. Ernst Ammann, a director of Krupp, entitled "The Use of Cemented Carbide in America," which I introduce as exhibit No. 55, pointed out that the production of tungsten carbide was booming in Germany and that in view of this fact "* * * it is striking that the United States * * * in spite of having the most important iron working industry and excellent cemented carbides at disposal, is employing cemented carbides only to a very modest extent." He then gave figures showing that, although American steel production was over twice that of Germany, German carbide production was about 10 times that of America. He then concluded that "* * * in Germany roughly 22 times more cemented carbide per unit of produced steel is consumed than in America." He then pointed out that, although cemented carbides in America have found their greatest application in the automotive industry, per manufactured automobile Germany used 20 times as much tungsten carbide as did the United States. In his conclusion he remarked that the undeveloped state of the industry in the United States was a strange phenomenon in view of the fact that America was generally known for its ability to grasp and develop the most modern manufacturing methods. I quote:

"Due to research and practical utilization of the joint efforts within the machining industry and due to the development of a sales service rich in experience, the cemented carbide business in Germany has taken a huge upswing.

"Tools and machine tools form the basis for any professional production of goods in a country generally. They serve the production of all other machines, expedients, and devices for traffic, agriculture, power production, and trade. Without highly developed tools and machine tool industry in no country is there a production of goods economical to the maximum.

"The advantages of the introduction of cemented carbides, therefore, were to the good of the entire German industrial and economical systems. Both these

Digitized by Google

systems could make use of the most modern tools and machine tools in order to bring the success of their production to the highest possible results.

"Similar to Germany, other European industrial countries have found application for cemented carbides on a broad basis.

"In comparing European and non-European industrial countries it is striking that the United States, in spite of having the most important iron working industry and excellent cemented carbides at disposal, is employing cemented carbides only to a very modest extent.

"The following comparative table of figures of consumption will best illustrate this.

"The production of raw steel in 1934 amounted—in America, 26,000,000 tons; in Germany, 12,000,000 tons. Proportion, 2.2:1.

"The consumption of cemented carbides in 1934 shows a proportion of—America: Germany, 1:9.8.

"This means that in Germany roughly 22 times more cemented carbide per unit of produced steel is consumed than in America.

"Considering the fact that scarcely 5% of the entire turn-over in Germany is used for drawing dies, while in America about 35% is used, this proportion grows still more unfavorable for America in the main field of cemented carbide application, namely, the machining industry.

"The cemented carbide consumption per manufactured automobile in 1934 was, in America, .5 grams; in Germany, 10 grams. Proportion, 1:20.

"It is a known fact that cemented carbides have found their greatest application in the American automotive industry while the remaining machining industries—for instance, the machine tool industry, the fixture industry, the mining industry, the chemical and chilled iron industries have used only a little carbide.

"Fifteen chilled iron mills in Germany consume 1,500 kilos of cemented carbide annually for the machining of chilled iron rolls, for roughing the chill and for forming profiles. (Compare figure No. 2.) The larger number of such mills in the United States hardly use carbides for this purpose at all.

"The general German machine industry consumes more than 10,000 kilos annually. In this branch, practice has taught that with four to five standard tools, almost all working pieces as, for instance, cog wheels, shafts, bearings, spindles, pulleys, cylinders, etc., can be machined. This is another indication that in this part of the American industrial system too only a fraction of the German consumption of cemented carbide is employed whereas it has become a matter of course in Germany. (See figures 4 and 5.)

"A comparison of the development of the raw steel production in Germany and America which is considered a sensitive barometer for business will show that since 1930 the tendency of the curves of cemented carbide consumption in both countries agrees with the production of raw steel. Only the two first years, 1928 and 1929, make an exception because tools as well as machines were not sufficiently altered for the use of cemented carbides. (See figure 3.)

"This means that the cemented carbide turn-over is directly dependent upon the quantities of raw steel consumed. The curves for both countries show this distinctly with the only difference being that the cemented carbide consumption per ton of raw steel in America is considerably smaller. Moreover, the production figures demonstrate strikingly how, during a boom in Germany which made the procuring of modern high efficiency machines possible for many factories, the turn-over in cemented carbides increased tremendously while the American turn-over in cemented carbides increased only slowly according to the increasing consumption of raw steel.

"Granting that the general introduction of high speed steel also took place comparatively slowly because the user welcomed the higher efficiency of the high speed steels but could not decide to spend more money for them, it must be said that the American industry certainly had time and opportunity enough to check on the advantages and the economy of cemented carbides in American factories during the ten years since cemented carbide was invented. The highly developed American machine tool industry surely was in a position, too, to provide the necessary machinery.

"This could have been expected also from the point of view of the interests of political economics because the United States, too, is lacking tungsten resources and has to import 75% of its requirements from foreign countries.

"Most of the high speed steels and machine steels contain tungsten, the same metal which is also needed for the manufacture of cemented carbide. Taking the output of a high speed steel with about 20% tungsten as a base, experience so far allow the assumption that the output of about 40 kilos high

Digitized by Google

speed steel is equal to the output of about 1 kilo cemented carbide. At an equal output the tungsten requirements, therefore, amount to 8 kilos using high speed steel and only .9 kilos using cemented carbide.

"If cemented carbides were introduced generally the American domestic production of tungsten would be sufficient to cover the entire tungsten requirements of the American machining industry.

"All these facts, showing that consciously the American industry employs cemented carbide only to a limited degree, force us to the assumption that there must exist fundamental differences between American and German conditions.

"Under the pressure for higher efficiency and shorter deliveries the use of cemented carbides in Germany has achieved a tremendous uplift, in comparison with which the American development is the less understandable, as America is generally known for its trend of grasping for the latest and most progressive manufacturing methods and developing them further.

"If our research is to be complete in order to serve the progress of our own economical system we cannot neglect this disagreement between American and European development of the employment of cemented carbides.

"After a thorough study and comparison of the conditions in America and in Europe it will be left to another paper to illustrate on which actual differences the varying developments described above are founded."

Beginning in 1931 widespread opposition within the General Electric organization itself developed toward the high price policy being followed by the Carboloy Co. A group of engineers connected with the Schenectady Works Laboratory of General Electric conducted a campaign to cause the dissolution of the Carboloy Co. as such and the assumption of its functions by the Works Laboratory of General Electric. On September 17, 1931, a concurrent suggestion along these lines was made by Merrill, an engineer of the Works Laboratory, and addressed to the "Office Employees Suggestion Committee," a group regularly established under the direction of one of the General Electric vice presidents for the receipt and study of such constructive suggestions. This letter, exhibit No. 56, speaks for itself and I quote it in full:

"I understand there is some question as to the advisability of continuing the sales of carboloy with the present set-up, and if changes are to be made, I submit the following for consideration.

"*Use of Carboloy tools.*—We have in the neighborhood of three years' experience in the manufacture and uses of carboloy tools and carboloy for other purposes.

"We could not justify the use of carboloy in our shops as a substitute for high-speed steel if the finished tools cost us more than 2½ times to 3 times the cost of high-speed steel. There are only a few exceptions in which we could pay higher prices for carboloy to replace such materials as diamonds in some of our cutting operations, but probably not over 25 jobs at a maximum in the Schenectady plant where we could consider the use of carboloy at prices beyond 2½ to 3 times the cost of steel. We think, with opinions to the contrary which are very freely expressed, that we know something whereof we speak on this subject.

"We have made in the last 24 months 11,310 lbs. of carboloy. Practically all of it has been applied to cutting tools. 60% of this output has been used in the Schenectady plant and 40% of it in our other plants. This is as against 8,854 lbs. of carboloy made by Krupp, Carboloy Company, Firth Sterling, and Ludlum for the same period. The Carboloy Company made 3,332 lbs. which covers their initial sales and replacements.

"I wish to call your particular attention to the fact that none of the above-mentioned concerns includes machining of steel in its category. They simply advise their customers that carboloy is not suitable and cannot be used on steel. About 60% of all our applications in the Schenectady plant have been and are on the machining of various steels, particularly such hard work as cold-rolled steel, drop forgings, and castings. Now, the principal reason for these various vendors not selling their tools for machining steel which is such an important item in the machine-shop industry today is that the prices they have to maintain for the carboloy does not allow them to put on carboloy enough to stand machining operations on steel. From a study of our drawings compared with the Carboloy Company drawings, for instance, it will be seen that we use from two to three times the depth of carboloy that they do. We are, therefore, as

Digitized by Google

backers of the Carboloy Company and other licensees in the absurd position of exploiting a cutting tool which is limited to cast iron and a few alloys.

"With the absurdly fictitious prices which are being maintained for carboloy tips, were they to put on enough of this material to machine steel, they would, of course, sell much less than they do at present, which to my way of thinking is just negligible. Another absurdity in the present hook-up is in the milling machine operations. A good sized milling cutter of 50 to 60 teeth with the necessary amount of carboloy to do a good job costs the customer approximately as much as a new milling machine to drive the cutter. These are a few of the high spots in the present situation.

"*Manufacture.*—A great deal of mystery has surrounded the production of this material since its inception. As a matter of fact, it is just about as complicated as making a good grade of concrete for a sidewalk: Grind up material, pass it through a mesh, put a certain percentage of binder with it, press it into a cake and bake it.

"We are equipped in Schenectady at the present time to manufacture 200 lbs. per week in various top sizes ready to be ground for tools. This is based on an 8 hr. shift of one man and one boy.

"*Manufacturing cost of tungsten.*—Manufacturing cost of tungsten on the basis of 200 lbs. per week (and we have maintained as high as 150 lbs. per week for a number of weeks in succession) is $8.00 per lb., and this is just as good tungsten carbide as is being made by anybody in North America or Europe. If we should maintain production of 200 lbs. per week, there is a further reduction possible of $1.75 per lb., bringing the price to $6.25 for unground tips. This shows the absurdity of trying to maintain the prices which we have evidently committed ourselves to, or perhaps others have committed us to.

"I am attaching K prints of 60 of our standard tools we manufacture and carry in stock. You will note several of these on each sheet give our manufacturing cost on the right-hand column and the cost of the corresponding high-speed steel tools in the left-hand column. You will see that our manufacturing cost runs about twice the cost of high-speed steel, some a litle more, and some a little less. These tools include, as mentioned above, about two or three times the amount of carboloy the vendors can afford to put on theirs.

"There are two courses open to the General Electric Co. if we are not to continue to lose money. The first is to forget carboloy entirely; simply manufacture it for our own use and get out of the business as quickly and as gracefully as possible.

"The second alternative, and probably the better, would be to cancel all agreements or reduce the price of tips ready for grinding to $50.00 a pound, which is a fair market price for these goods and is approximately the price that I found the Krupp Company were selling tip material for last year. This, you will note, would give us approximately a 7:1 mark-up over manufacturing cost, which should be a satisfactory profit. The unground tips could then be sold to tool manufacturers as well as ultimate users for their own brazing and grinding.

"I wish to make the following recommendation for set-up to handle this work.

"1. There is no necessity whatever for any special commercial set-up, no trained salesmen, no particular selling expense.

"2. There is no need for any extensive advertising because carboloy under its various names is now well known to the trade, and the question of price is practically the one and only reason why such small quantities have been disposed of in the past two years.

"3. All that is necessary is printed literature giving the standard sizes of tips from the smallest to the largest which we have to be adequate to meet tool conditions, and a price list on a basis of about $50.00 per lb.

"4. We would make no guarantees on this material whatever. It would be in the same class as the high-speed steel which we buy and have been buying for years. We buy the best steel we can for the various types of tools. If it works, O. K.; if it does not, we ask for no comeback and expect none from the steel supplier. Carboloy material should be in the same class.

"5. *Profits.*—It would seem reasonable to suppose that we could dispose of, say, 400 lbs. per week to the trade, which is a little more than twice what we have been absorbing ourselves at times in the various G. E. plants, with a profit above manufacturing cost of $40.00 per lb. This would give us $16,000.00 a week, which capacity could be increased to 600 lbs. with practically no additional investment in the Schenectady plant.

Digitized by Google

"With this program there would be no loss to the company during periods of low volume of sales.

"The Schenectady Works would very much appreciate an opportunity to manufacture this material, and the Schenectady Works Laboratory would like to demonstrate the soundness of the above proposition by taking over the selling of it for a period of, say, two years."

As a result of the above letter, hearings were held before the committee and a subcommittee appointed to handle it. The subcommittee reported adversely to the plan on the ground that "* * * due to the contractual relations now existing between the General Co. and the Carboloy Co., on the one hand, and the Krupp Co., the Firth-Sterling Co., and the Ludlum Steel Co., it would be impractical at the present time * * *" to put the plan into effect. However, when the report of the subcommittee was submitted to the entire group the plan received a greater measure of approval. Nevertheless, as is apparent, the plan was never put into effect. I introduce the committee's report as exhibit No. 57.

In 1938 a meeting was held of the executives and principal employees of the Carboloy Co., where the future price policy of the Carboloy Co. was discussed. These minutes of the meeting are introduced as exhibit No. 58. According to the minutes, President Robbins opened the discussions by stating that the basic patents would begin to expire in 1942 and that a complete change in the business policy of the Carboloy Co. was made necessary by this fact. Opinions were taken on the effect which a 10-cent per gram price ($45 per pound) would have on Carboloy operations, although Robbins observed that "based on European experience, the net price of ten cents per gram is probably higher than can be expected." Merrill, who was an engineer of General Electric as well as a director of Carboloy, made the following observations, contrasting Carboloy's price policy and resulting sales volume with the greater use which General Electric itself could make of tungsten carbide, since it would manufacture its own tungsten carbide:

"1. There are five times as many tools in General Electric plants as if Carboloy had handled the sales direct.

"2. The Works Laboratory makes and sells tools and other carbide parts at prices lower than the Carboloy Company will sell and makes a profit which carries the cost of test work.

"3. The Works Laboratory sold within the General Electric Company 1/7 of the total Carboloy produced last year."

At this meeting of the Carboloy executives on June 28, 1938, Jeffries is reported to have said:

"The artificialities represented by price control have retarded the use of carbide on many large volume applications. Agreements with Krupp made it impossible to remove the artificialities before this time.

"As we go forward more and more of the artificialities will be removed until we are free from all of them in 1942."

The price graph which I have introduced shows that there had been no substantial reduction in price until October 1936 after Krupp had been eliminated from the American market.

The high price policy pursued by Carboloy has been criticized again and again by Carboloy licensees, by the machine tool industry, and by customers. The opposition of Mr. L. Gerald Firth, president of the Firth-Sterling Steel Co., the second largest American producer of tungsten carbide, has been long standing. I introduce, as exhibit No. 59, a letter dated December 28, 1931, which Firth wrote to Mallory, then president of the Carboloy Co. I quote as follows:

"I still feel that this is a very vital and urgent matter. The present high price of cemented carbides is from ten to fifteen times, in many cases, the price at which the material is sold in Germany * * *

* * * * * * *

"Please bear in mind that as I have said before, the price in this country is from ten to fifteen times the German price and that is a difficult thing to justify now that industry in general is recognizing the value of our product."

It has already been reported in a general way that, in the spring of 1940 Mr. Firth submitted a complaint to the Antitrust Division based upon the fact that under the terms of his license agreement, on May 20, 1940, he was required to quote in the amount of $8,730 for 1,000 shell-turning tools to the Frankfort Arsenal whereas if he had been able to determine his own price he would have quoted in the sum of $3,375 on the same invitation for bids.

In 1935 a special research committee was formed under the auspices of the American Society of Mechanical Engineers for the purpose of studying progress which had been made in the cutting of metals. Mr. Coleman Sellers, III, chairman of this committee, stated in a letter dated June 27, 1935, to President Robbins of Carboloy, which I introduce as exhibit No. 60, that—

"Considerable evidence was presented to show that the price of tungsten carbide tips of the larger sizes is retarding the use of this material. It seems to me that those using tungsten carbide tools to any great extent are engaged in production work using comparatively small tools. This type of shop can easily calculate the savings from the use of this material and definitely determine whether or not it pays them to invest. On this basis a great many tools have been sold and are in use at the present time.

"The field which has been backward in promoting the greater use of the carbides is represented by the jobbing shop or small-lot production shops. Tools cannot often be purchased for specific jobs or if they are, these jobs are not in operation continuously which means that the tools will only be used occasionally. These shops could make good use of this material on jobbing work if they would invest in sufficient quantities of tools to supply their needs. These tools wou'd be larger on an average than the production shops because the amount of stock to be removed cannot be controlled as closely with small lots as with high production. Consequently, heavier cuts must be expected, not only from this reason but because this class of shop would include those doing larger and heavier work which cannot be produced on a production basis.

"Mr. R. E. W. Harrison, of the Department of Commerce at Washington, has heard from so many quarters complaints regarding price that he feels very strongly on the subject although he cannot take any active part in the discussion because of his official position. However, he told me in confidence, that he wants to recommend the various Government Navy Yards to go into tantalum and tungsten carbide tools in a big way but is afraid to recommend this on account of the high price of the material. If you know anything about the size of our Navy Yards you will know that this one item alone would mean a lot of business."

The Warner & Swasey Co. of Cleveland, is one of the largest American manufacturers of a machine tool called the turret lathe. Mr. Charles J. Stilwell, a vice president of that company, has on numerous occasions attempted to pursuade the Carboloy Co. substantitally to reduce its prices in order that a more widespread use of tungsten carbide in small-lot production shops could be made possible. On May 20, 1936, Mr. Stilwell wrote a letter to Robbins, president of the Carboloy Co., which I introduce as exhibit No. 61. I quote:

"As you know, few machine tool manufacturers in this country have been more interested, and I think few have been more cooperative, in the development and use of cemented carbide alloys than we. We have not made nearly the progress in the United States that has been made in Germany, France, and more particularly in England. I reported to your representative and had a long talk with Mr. Prosser after my return from Europe in 1934. Because of the more systematic, and I believe more scientific development and presentation of collected information on the subject of cemented carbide tools that has been carried on in Europe, the average user of cutting tools is far more intelligent on the general subject than we are in this country.

"Somehow or other, the people who have the development and sales of tungsten alloys in England have secured a greater acceptance and more general usage of these tools than exists here. I know from personal contact with two manufacturers in that country that the project is carried on on a highly profitable basis. The prices are very much lower, as you know, than we have to pay you. I think it is fair to assume that your own business in Carboloy is equally highly profitable, but you are doing it at the expense of general usage on the part of small manufacturers. Your company seems to prefer high profit and a limited market, and, if I may say so, a retarded growth of volume, rather than a large volume, smaller unit profit, and the encouragement of a much wider usage over a period of years.

"This is a policy which I am frank to say I cannot agree with for two reasons: (1) We cannot understand the wisdom of it from your own standpoint looking to the future; (2) the exceedingly high price charged for Carboloy retards the growth of our own sales of Carboloy and makes our job of introducing that metal many times harder.

"Until you can secure an arrangement whereby the cost of carbide tools to the general users can be much reduced, I do not believe that we will enjoy the

Digitized by Google

economy of production that could be brought about by general acceptance on the part of manufacturers, large and small. You will forgive my writing you so frankly, but I think that this whole question forms part of our interest in the machine-tool business even though it happens to be your own particular business."

On September 21, 1936, Stilwell stated as follows in a memorandum which I introduce as exhibit No. 62:

"From Wickman's letter of December 7, 1934, in connection with tools which I had ordered in England that year, we have the following information:

"A tool which we tested out here costs $6.87 in England. Mr. Lange advises me that a similar tool purchased here from the Carboloy Company would cost $20.48.

"This information is for Mr. Robbins at the time of his call."

Also on May 20, 1936, a letter of protest was written to the Carboloy Co. by Mr. W. E. Whipp, of the Monarch Machine Tool Co., of Sidney, Ohio. Mr. Whipp is also a very active member of the marketing committee of the Machine Tool Builders Association. I introduce this letter as exhibit No. 63. The letter contains the following:

"We are vastly more interested in when the Carboloy Company is going to reduce the price of Carboloy and Tantalum Carbide and get it down somewhere near the price at which it sells in Eureopean countries. We are paying eight to ten times the prices for these tools that they bring in foreign countries, and this excessive price is a very serious handicap. As a matter of fact, machine shops in continental Europe are far surpassing us in this country on many machining jobs, due to their far more universal use of these new carbide tools. You can never put the job over in this country so long as there is this wide difference in price."

NATURE OF THE PATENTS POOLED

The doubtful validity of certain of the patents was recognized when they were pooled

There is evidence that some of the parties to the pool realized that certain of the patents which had been pooled were of doubtful validity and might not stand a test in court. Hence, from time to time, there were absorbed into the combination a number of American manufacturers who began independently to produce hard metal compositions under competing patents held respectively by them. In this way the pool absorbed rights under patents for tantalum carbide and titanium carbide. A process of monopolization by the pooling of patents which potentially competed and which were of doubtful validity having been begun by a pooling of the interests of the two owners of the principal patents involved, namely, General Electric and Krupp, was continued by the following policies: (*a*) A policy of filing patent-infringement suits against all "intruders" in the field which, as to the stronger intruders, were settled on the basis of restrictive cross-licensing agreements and, in the case of the weaker intruders, were resolved by consent decrees eliminating such threatened competition; (*b*) a policy of preventing judicial investigation and determination of the validity of the pooled patents in the United States as to United States patents, and also in foreign countries with regard to corresponding foreign patents; (*c*) a policy of suppressing such technical information and knowledge gained by the parties to the pool, the availability of which would better equip an outsider to challenge the validity of the pool and the patents embraced in it. These three policies not only protected the pool against attack but also reenforced and augmented the pool with rights under all related patents. These policies also laid a foundation, through the acquisition of all available patents and through the suppression of potential competitors, upon which the parties could continue the monopoly thus acquired long after the period when their original patents would have expired.

During the 1920's, when the United States patents, which were later pooled, were being taken out and the product tungsten carbide was being perfected in the laboratories, it was recognized, particularly by the patent attorneys of General Electric in charge of these matters, that Krupp's patents and also General Electric's patents were neither broad nor strong. Numerous memoranda were written by Morrison, a General Electric patent attorney, in which he called attention to the fact that some of the patents, and certain claims of some of the other patents, were of doubtful validity. For example, Morrison in a memorandum to Lunt, apparently his superior in General Electric, dated October 7, 1927, which I intro-

Digitized by Google

duce as exhibit 64, made the following statement with reference to the Krupp's first Schroter patent, which is the so-called basic patent supporting the pool:

"Schroter patent No. 1,549,615 contains one broad claim on what is known as the German process for preparing carboloy. This process, however, appears also to be anticipated by the Voigtlander patent No. 295,726."

He then referred to the application for the Krupp's second Schroter patent as follows:

"It might be argued that the Baumhauer patent No. 1,512,191 anticipates the article claims of the Schroter application, since Baumhauer discloses a combination of tungsten carbide with widely varying amounts of auxiliary metal, although particular amounts of auxiliary metal are not specified in the Baumhauer patent.

"Schroter application No. 104,613 contains no allowed claims. It is entirely possible that this application may be held to disclose nothing patentable over Schroter patent No. 1,549,615, since the application varies from the patent substantially only in the content of auxiliary metal. It appears that it might also be argued that the Schroter application No. 104,613 does not distinguish patentability from Baumhauer."

In a memorandum to Davis, General Electric vice-president, dated January 4, 1928, which I introduce as exhibit No. 65, Morrison stated with reference to claim 7 of the Baumhauer patent as follows:

"While this claim reads directly on our Hoyt product, it is clearly anticipated by the German patent to Voigtlander et al., No. 295,726 of 1916, which discloses a combination of tungsten carbide with several percent of molybdenum."

In discussing Schroter patent No. 1,549,615, the first or so-called "basic" Schroter patent, he stated as follows:

"The method claim (No. 4) of the patent is infringed by the Hoyt process. This claim, however, is of very doubtful validity in view of the Voigtlander patent cited above."

He then referred to the pending application for the second Schroter patent as follows:

"No claims have been allowed in the application. While claims other than those specified below may eventually be obtained, the claims which we may fairly expect to be allowed by the Patent Office will probably be limited to: (1) A composition consisting largely of tungsten and containing carbon and more than 10 percent cobalt, (2) a composition consisting largely of tungsten and containing carbon and from 10 to 20 percent cobalt, (3) sintered compositions of the above.

"* * * The validity of 1, 2, and 3 is not entirely without question in view of the Baumhauer patent noted above, which discloses tungsten carbide saturated with 'iron *or a like metal*,' and in view of the fact that it is old to consolidate powdered materials by sintering."

Morrison in another memorandum to Davis, dated March 29, 1928, which I introduce as exhibit No. 66, made the following statement, also with reference to the application for Krupp's second Schroeder patent:

"Schroter application, Serial No. 104,613, covers a combination of tungsten carbide and cobalt, the cobalt content ranging from 10 to 20% of the content of the alloy. This application is *not* a division of the Schroter application which matured into patent No. 1,549,615. There is a question in my mind as to whether a valid patent can be obtained on this application in view of the Schroter patent No. 1,549,615."

Morrison, in a still later memorandum to Davis, dated April 7, 1928, which is with reference to Morrison's conference with H. H. Knight, Krupp's American patent attorney, and which I introduce as exhibit No. 67, stated:

"He [Mr. Knight] expressed the opinion that the patent situation could be improved by a combination of the interests of the Krupp Company and the General Electric Company but at best it was somewhat loose since we apparently cannot cover an alloy consisting of tungsten, carbon, and cobalt in which the cobalt content is more than 10% of the alloy. You will recall that this is the combination which I have tried to cover in the Schroter application Serial No. 104,613, but which I believe to be invalid in view of the prior Schroter patent. Of course, if a patent can be obtained on an alloy of tungsten, carbon, and cobalt which has 6% carbon and contains no free graphite, such a patent would be very helpful. I do not know that such a patent would be valid but in view of the Schroter patent in which he states that free carbon is desirable, it appears that such a patent might be very useful either to the General Electric or to the Krupp Company."

Digitized by Google

In the succeeding years, during the period when General Electric was granting restrictive patent licenses to such newcomers or intruders in the tungsten carbide field as it could not induce to abandon such manufacture, it was brought to General Electric's attention again and again that these various and sundry invaders sincerely believed that the patents then in the pool were either invalid, or so clearly limited in scope, that the patents obtained by the newcomers gave them adequate protection and the right to compete. The letter from the patent attorney of the American Cutting Alloys Co., which became a restricted Carboloy licensee for titanium carbide only, written to Carboloy on August 20, 1932, contains the representation that the Carboloy patents were "so far as broad claims are concerned not to be upheld in court over the prior art * * *" I introduce this letter as exhibit No. 68.

On August 23, 1932, Mallory, then chairman of the board of Carboloy, wrote to Jeffries, then president of Carboloy, nothing the desirability of bringing the American Cutting Alloys Co. under license restriction. He pointed out the danger to Carboloy of an otherwise possible alliance between the American Cutting Alloys Co. and the Fansteel Products Co., another new entry into the tungsten and tantalum carbide business. He stated that—

"Fansteel's patent attorney will unquestionably tell them [the American Company] that the Carboloy patents are not broad enough to cover this [titanium carbide] development."

I introduce this letter as exhibit No. 69.

In early 1934, two scientific articles were published in the magazine "Iron Age" which had been written by Karl Schroeder, the Osram engineer to whom had been granted the principal patents contributed by Krupp to the patent pool. These articles contain several statements which represent points of view at variance with those taken by the attorneys and experts of the Carboloy Co. in the only litigation in which the Carboloy patents were ever involved. When these scientific articles came to the attention of the General Electric Co., steps were taken to prevent the dissemination of similar information in the future. I introduce as exhibit No. 70 a letter dated February 7, 1934, from Scudder of General Electric to Peirce, General Electric's representative in Germany. It discloses a feeling of legal insecurity and furnishes an example of an organized attempt to suppress knowledge in a field wherein persons concerned are supposedly contributing to the advancement of science and the useful arts. I shall read the body of the letter in full:

"We have just learned that an article has been published in the IRON AGE in this country February 1, 1934, page 27, entitled 'Inception and Development of Hard Metal Carbides.' This article is by Mr. Karl Schroeder, who is an employee of the Osram Company. It is indicated that another article will be forthcoming shortly.

"As you know, we have our Lamp Agreement with the Osram Company. We also have an agreement with Krupp by which we are entitled to certain rights on Osram inventions relating to cemented carbides and which do not come within the scope of our I. G. E.-Osram Agreement. The article in question deals with these cemented carbides.

"We are much surprised that Mr. Schroeder was permitted to publish an article of this kind without having first submitted it to the General Electric Patent Department. As I believe you fully appreciate, sometimes articles written by an invenor from whom we have the patent rights may be embarrassing to us and may be used against us in case we have to bring infringement suits which involve the patents of that inventor or even patents of a more or less similar nature on inventions which may not be made by that inventor but which we may own.

"We would appreciate it very much if, at the earliest opportunity, you could see Mr. Schwab, the head of the Patent Department of the Osram Company, and call his attention to this situation. I explain it in more detail below.

"We do not know exactly what system the Osram Company have in regard to looking over articles by their employees before publication. As you know, we have in this country a rigid routine which provides that all articles written by our employees before publication must be submitted to the Patent Department in order to see that no statements are made which may affect our patent situation. I presume that the Osram Company has a similar routine. In this particular instance, there might be a minor complication in that we have our license under the Schroeder U. S. patent from Krupp. Therefore, it might seem that Krupp should exercise some sort of censorship also. Primarily, however,

Digitized by Google

it seems to me that the Osram Co. Patent Department should be responsible for looking over articles written by its employees.

"Also, when an article is to be published by an employee of one of our Companies in the exclusive territory of another Company, we feel such an article should be submitted to the Company controlling the exclusive territory and receive the approval of the Company controlling the exclusive territory before it is published. Even though the Patent Departments of our different affiliated Companies may realize the possible danger to patent situations in publishing articles, the Patent Department of the Osram Company, for example, is not nearly so well informed as that of the General Electric Company as to what language and what statements may be safely used in connection with articles of the kind mentioned with due consideration of our patent situation in this country.

"We, therefore, feel that the Patent Department of the Osram Company should have submitted the manuscript of this article by Mr. Schroeder to us before it was published in IRON AGE, as mentioned. We also feel that no further articles by Mr. Schroeder, or any other employee of the Osram Company should be published in this country without the opportunity for us to see the manuscript and approve of publication, with or without any comments we may care to make upon it.

"I would suggest that you might also ask Mr. Schwab to take up this matter with the Krupp Company and point out to it the possible danger of publication unapproved by us in this country.

"For your personal information, I would say, as a matter of fact, that we have studied the article in question and do not believe that it will be harmful to us. However, one can never tell whether articles of this kind may not contain statements that will affect our patent situation."

It has been the settled policy of General Electric and Carboloy not to permit infringement suits to proceed far enough to test those pooled patents but rather to settle such actions either by licenses or consent decrees. The obvious result of such a policy was to prevent a judicial determination of the validity of the pooled patents. This policy clearly rested upon an apprehension that the patents were weak and a wholly justified fear and expectation that they would be invalidated if brought to a test. I introduce as exhibit No. 71 a letter dated March 8, 1934, in which Jeffries, now chairman of the board of Carboloy, outlined the Carboloy patent policy to Birge, a General Electric vice president, as follows:

"I have been connected with a number of patent suits during the past two years and have observed a number of others. I have also talked with several prominent patent attorneys. I have in mind, too, the decisions of the Supreme Court during the past four or five years relating to patents. There seems to be a definite tendency to invalidate patents in the courts at the present time. My thought is that the courts will be more adverse to patents rather than otherwise during the forthcoming months * * *.

"The above has a definite bearing on the policy of the Carboloy Company with respect to the prosecution of the Super-Tool suit in Detroit."

He then stated that a "wave of opinion against patents has struck the Federal judges." Other excerpts from the letter are as follows:

"We cannot expect to obtain the best opinion on this matter from outside patent attorneys. I do not mean that we should not seek the advice of our own Patent Department, but patent attorneys who are in business for themselves are not apt to agree with the general proposition that this a poor time to try patent suits. Such an assertion would obviously reduce their fees."

In conclusion, Jeffries recommended that the Eisler Electric Co., the particular new competitor then in question, be brought under restrictive license. He pointed out that it was Eisler who had formerly beaten one of General Electric's patents in a court test and who generally refused to acknowledge and follow General Electric's leadership. He then made the following observation:

"However, it may be better to use the Disraeli method of keeping the suspicious ones close at hand where they can be better watched and, if it is considered desirable that such a plan should be given a trial, I shall be glad to make the approaches and proceed with negotiations."

The General Electric and Carboloy policy of preventing a court test of the patents was not confined to the United States. Obviously any determination in a foreign country that foreign patents corresponding to those pooled by the parties in the United States would be a strong precedent for an American court and a great inducement for potential American competitors to enter the United

Digitized by Google

States market. Efforts have been made, by Krupp in Germany and by General Electric and its associated companies in England, to prevent a judicial investigation into the corresponding patents in those countries. A letter dated December 23, 1935 from Lusk of the British Thomson-Houston Co., to Minor, president of the International General Electric Co., shows that British Thomson-Houston was then being sued by the Krupp interests in England for alleged infringement of a Krupp British patent on tungsten carbide and that negotiations were then in progress looking toward a settlement of the dispute by pooling the patents of those parties, and by price-fixing and quota arrangements. The letter contains the following:

"We are as satisfied as one can ever be in connection with any patent question that the Krupp patent is thoroughly bad and that their action against us has no chance of succeeding. As I have explained, however, on a number of occasions to the Osram people, and as I have also explained to Krupps, we do not wish to see their patent declared invalid, and we have been prepared to do anything which was reasonable to avoid this."

I introduce this letter as exhibit No. 72. Jeffries was in Europe at this time and a letter from Klotzbach, of Krupp, to Jeffries in Paris, January 8, 1936, shows that Jeffries had been using his good offices to negotiate a settlement of the dispute between the opposing interests in England. I introduce this letter as exhibit No. 73.

The first paragraph of this letter is as follows:

"I refer to the conversation we have had last Sunday regarding the British situation. It is true that any weakening of the British patent in suit would be detrimental to the American situation, too. Although according to all information I have obtained relating both to the technical and the legal side of the pending case I feel absolutely confident of an issue of the pending suit in our favor, I agree with you that the matter should be looked at more from the business than from the patent point of view because of the uncertainty which is always involved in an action, and I confirm that I am still prepared to agree to a friendly settlement of the pending suit under the following main outlines which comply with your and Mr. Robbins' suggestions."

General Electric and Carboloy have made inconsistent representations on the scope of certain of the pooled patents from time to time. As against the Fansteel Co., manufacturers of cemented tantalum carbide, Carboloy has contended that the patents in the pool were broad enough to cover tantalum carbide compositions as well as those consisting entirely of tungsten carbide. Indeed, the license agreement between Carboloy and Fansteel is based upon this premise. However, in 1936, when discussions were taking place between Krupp and General Electric with regard to General Electric's obligation to pay increased royalties on products made under the patents contributed by Krupp, General Electric claimed that certain tantalum carbide materials were not covered by the claims of the Krupp patents. I introduce as exhibit No. 74 Jeffries letter to Klotzbach, of Krupp, dated February 13, 1936, wherein he stated with reference to this subject that—

"It is the position of our people that in this field Krupp's patents only provided us partial protection and the Fansteel's patents provided the remainder."

He then stated that pure tantalum carbide materials cemented with nickel were "probably not covered by the Krupp patents." In spite of this obvious fact, General Electric, by the threat that Fansteel's operations would infringe these patents contributed by Krupp, induced the Fansteel Co. to become a Carboloy licensee, and to have its prices fixed by Carboloy, and its production restricted to materials containing at least 17 percent tantalum carbide. The same considerations apply to the titanium carbide patents controlled by the American Cutting Alloys Co., which was brought under control by a similar restrictive license from Carboloy. In the letter from Jeffries to Klotzbach referred to above, exhibit No. 74, the same representation was made by Jeffries concerning the titanium patents as is quoted above with reference to the tantalum patents.

At a meeting of the Carboloy executives which took place from June 27 to July 1, 1938, inclusive, Jeffries, chairman of the board of Carboloy, is quoted as follows in the minutes which were kept of the meeting:

"We should not lean too heavily on patents, since the courts are becoming anti-patent minded and even with strong patents only about half are upheld by the court.

"The main advantage of the patents has been to take Krupp out of this market."

These minutes have heretofore been introduced as exhibit No. 58.

The pooled patents disclosed no patentable invention but merely represented improvements in the development of the mechanical skill of utilizing a material and processes already well known

One of the principal reasons for the final invalidation of the principal patents, in addition to the absence of novelty, was the fact that they were held out to disclose sufficient information to enable a man skilled in the art to manufacture the product purported to be covered by the claims. Judge Tuttle, in his opinion, pointed out that while the application for the so-called "basic" Schroter patent was filed in 1923, it was not until 1928 that General Electric introduced the use of the material into its own shops for wire-drawing dies. The letter from Davis, vice president of General Electric, to Burchard, of International General Electric, November 26, 1926, which I introduce as exhibit No. 75, shows that General Electric had then recognized the fact that, as a practical material, tungsten carbide had not yet been "invented." It stated:

"I now learn that we have not yet been able to reproduce such steel [tungsten carbide] uniformly. There is a trick yet to be found out and it may be that this is why Krupp is not yet exploiting it."

A letter from Krupp to General Electric dated September 13, 1927, which I introduce as exhibit No. 76, also shows Krupp's recognition at that time that the work done by Schroter and others in the Osram factories, where tungsten carbide is supposed to have been perfected had merely contributed a beginning in the improvement process. The letter contains the following:

"The hard metal as taken over by us from the Asko was, however, not quite suitable for work where the tools were subjected to hard, rough wear and to shocks. We have improved this metal to such an extent that it can be used for various kinds of work, and it is by far superior to high speed steel and tools made of stellite-like material."

Representatives of parties to the pool realized at the time that they were pooling independent competing patents and that the pooling was not necessary to resolve "deadlocks"

The situation in the year 1928 when the patents were pooled was that tungsten carbide, a substance already known to the art, had been developed and improved in the Osram Lamp Works, in the Krupp Works, and in the General Electric Laboratories. The Krupp and General Electric developments stemmed, independently, from the work of the Osram employees. By this time General Electric and Krupp had each taken out several improvement patents in the United States upon manufacturing processes. The view of certain of General Electric's employees prior to the execution of the patent pooling agreement was that, because some of the Krupp patents were limited in scope, the improvement processes developed by General Electric would permit General Electric to enter into the manufacture and sale of its tungsten carbide independently of the patents originating with Osram and then controlled by Krupp.

I introduce as exhibit No. 77 the following letter dated April 15, 1927, from Lunt of General Electric to Davis, vice president of General Electric, from which I quote as follows:

"Attached you will find Mr. Morrison's report in detail on what, for lack of a better term, I will call the 'Carboloy' situation. The general conclusion which we may draw from this report is that in the process invented by Mr. Gilson of our laboratory we have a process which does not infringe any of the patents already issued on Osram Company applications, nor does it infringe the pending application which we filed and which was not assigned to us. There is, however, some question as to this pending application because, as yet, no claims have been allowed, and we do not know just what will be allowed. It might also be argued that one of the claims of the Baum [hauer] patent might conceivably be said to cover this process though we think it very doubtful; the language of the claim would have to be stretched considerably.

"I think, therefore, that you can tell Dr. Meinhardt that we have a process which, in our opinion, will not come under any of the claims of cases originating with the Osram Company, and on which we expect to get patents ourselves. This process, it seems to me, is very advantageous for manufacturing reasons if for no other. I understand that a body of metal may be pressed up in a very few minutes into completed form. There is some reason to think that the material may also be superior to previous forms of metal of the same general kind."

Digitized by Google

Just 10 days prior to the formulation of the first draft of the Krupp-General Electric pooling agreement, patent counsel for General Electric and Krupp, respectively, appear to have agreed between themselves that the nature of the patents was such that General Electric could have entered the market independently of any license from Krupp. The letter from Morrison, General Electric's patent counsel, to Davis, vice president of General Electric, dated April 7, 1928, which I have already introduced as exhibit No. 67, contains the following account of his discussion with Krupp's patent counsel:

"On Thursday of this week I discussed the Carboloy situation with Mr. Herbert Knight of Knight Bros. at their Washington office * * * I spent considerable time explaining these two patents as well as the various patent applications which we have received from the Osram Company and those which we have filed ourselves. He is convinced, I believe, that our Gilson process may be carried out without infringing any existing patents, also that if Schroter application Serial No. 104,613, which I have filed is allowed the claims therein will be invalid in view of the Schroter patent which covers 10% cobalt. I informed him that the claims in the Baumhauer and Schroter patents while somewhat limited are nevertheless broader than the claims suggested to us by the Osram Company and that we had obtained all the protection to which we believe we were entitled in view of the disclosure given to us. * * *

"* * * He expressed the opinion that the patent situation could be improved by a combination of the interests of the Krupp Company and the General Electric Company but at best it was somewhat loose since we apparently cannot cover an alloy consisting of tungsten, carbon, and cobalt in which the cobalt content is more than 10% of the alloy. You will recall that this is the combination which I have tried to cover in the Schroter application Serial No. 104,613, but which I believe to be invalid in view of the prior Schroter patent. Of course, if a patent can be obtained on an alloy of tungsten, carbon, and cobalt which has 6% and contains no free graphite, such a patent would be very helpful. I do not know that such a patent would be valid but in view of the Schroter patent in which he states that free carbon is desirable, it appears that such a patent might be very useful either to the General Electric or to the Krupp Company."

Certain General Electric engineers were also of the opinion that there was no patent "deadlock" between Krupp and General Electric with relation to tungsten carbide. The letter from W. G. Gartner of General Electric to A. G. Davis, vice president of General Electric, dated August 21, 1928, written 3 months before the execution of the pooling agreement, which I introduce as exhibit No. 78, contains the following:

"Mr. Hawkins told me today that in his opinion the General Electric was making a mistake in not putting Carboloy on the market. We feel that we have a mighty good case to back up the position that hot pressed Carboloy made by Mr. Gilson does not infringe the patents under which Krupp claims rights."

Six months after the execution of the pooling agreement, authorized agents of General Electric in Germany, while endeavoring to induce Krupp to take an exclusive license for certain territories and to pay royalties under General Electric's German patents corresponding to the United States patents General Electric had contributed to the pool, made strong representations that the patents of General Electric were independent of Krupp's and competitive with the products manufactured by Krupp under its developments and the developments of the Osram Co. A "documentary memorandum" dated at Berlin, May 3, 1929, which I introduce as exhibit No. 79, contains the minutes of a discussion between representatives of Krupp and Allgemeine Elektricitaets Gesellschaft, the "German General Electric Co.," which acted as the representative of General Electric in these discussions. I quote from these minutes:

"The A. E. G. stated that, in their opinion, it is to the interest of everyone concerned, that is, to the interest of the A. E. G., G. E., and Krupp, that agreements within the field of 'Hartmetall" be made in the proposed manner. They emphasized that both the G. E. and the A. E. G. hold the viewpoint that the G. E. patents on Carboloy are independent of the Krupp-Osram patents so that, in case no agreements are reached, the possibility exists that Carboloy will be made and sold in Europe in competition with the Krupp 'Hartmetall,' although G. E. and Krupp work together in America in regard to manufacture and sales.

"Director Preussing admitted that, even though the Krupp Company doubts the independency of the G. E. patents, the possibility exists of such a competition, and of the undesirable consequence that resultant patent proceedings ensue; but

Digitized by Google

he added that he cannot present the basic standpoint of the Krupp Company, as to whether or not the closing of an agreement appears appropriate to them, until the technical experts of Krupp Company have made comparative tests with Carboloy and Krupp 'Hartmetall.' In view of the fact that, according to Director Preussing, such comparative tests at Krupp's have not yet been made, notwithstanding the agreement which has already been negotiated between Krupp and G. E., it was agreed that Krupp as soon as possible shall give the A. E. G. an order for Carboloy samples in a sufficient quantity to make the tests. The A. E. G. will obtain the Carboloy from the G. E. and will otherwise assist in the making of these tests on the basis of their experiences with Carboloy and Krupp-Osram metal.

"Director Preussing stated that Krupp will not present any opposition against the applications filed by the A. E. G. for 'Hartmetall' alloys, not even before the actual contract negotiations are stated.

"The A. E. G. emphasized that, according to their experience, the properties of Carboloy and Krupp-Osram metal are not identical and that Carboloy offers advantages for many applications."

Under the cartel agreement Krupp has been kept informed of United States production of tungsten carbide

Four times each year since 1929, General Electric has submitted a "royalty report" to Krupp which has supplied Krupp with information as to the volume of tungsten carbide manufactured and sold by each of the several manufacturers in the United States producing under the patents covered by the pool. Moreover, since July 1, 1936, General Electric has reported to Krupp in addition the dollar volume of sales of hard metal composition by itself and the Carboloy Co. This was done because since that time it has been the obligation of General Electric and Carboloy to pay a royalty to Krupp in the amount of 10 percent of their net sales. I introduce as exhibit No. 79a, a cumulative royalty report to Krupp prepared by Carboloy which covers figures from the beginning of the Carboloy's operations until the end of 1939. I introduce as exhibit No. 79b, a sample of the type of royalty report submitted quarterly to Krupp since July 1, 1936, in which the amount of sales in dollars is also indicated.

The tungsten carbide industry in England was also controlled by a similar cartel agreement based on British patents corresponding to the United States patents in spite of the fact that the British company which entered the cartel believed the Krupp patents invalid

The tungsten carbide industry in England has also been a branch of the worldwide cartel and somewhat similar restrictions have been imposed. Krupp became actively interested in the British tungsten carbide industry when it set up its Tool Metal Manufacturing Co. in Coventry as the producing and licensing instrumentality under the Krupp British patents. A complication developed, however, when Krupp's rival in Germany, the Deutsche Edelstahlwerke, a satellite of the great Vereinigte Stahwerke, A. G., and the owner of British patents on titanium carbide entered the English market in competition with Krupp, by setting up a concern known as Cutanit, Ltd., which engaged the British Metropolitan-Vickers Co. as its manufacturing agent. A dispute arose when Krupp's company, the Tool Metal Manufacturing Co., was negotiating with British Thomson-Houston Co., a concern in which General Electric is substantially interested, to get British Thomson-Houston to accept a restrictive license agreement under the Krupp British patents. British Thomson-Houston appeared to be unwilling to accept such a license on Krupp's terms for two reasons: (1) because it believed Krupp's patent position to be "thoroughly bad" and (2) because it was unwilling to act for a number of its associated companies, including Metropolitan-Vickers. I quote again from a letter dated December 23, 1935, from Lusk of British Thomson-Houston to Minor, president of International General Electric, which I have already introduced as exhibit No. 72:

"We are as satisfied as one can ever be in connection with any patent question that the Krupp patent is thoroughly bad and that their action against us has no chance of succeeding. As I have explained, however, on a number of occasions to the Osram people, and as I have also explained to Krupps, we do not wish to see their patent declared invalid, and we have been prepared to do anything which was reasonable to avoid this."

The letter from Klotzbach of Krupp to Jeffries of Carboloy, dated January 8, 1936, which I have already introduced as exhibit 73, shows that Jeffries had intervened to help settle this dispute, a settlement of which would prevent a threat to the British patents and through them to the corresponding patents of the United States. I quote the first paragraph of that letter:

"I refer to the conversation we have had last Sunday regarding the British situation. It is true that any weakening of the Britsh patent in suit would be detrimental to the American situation too. Although according to all information I have obtained relating both to the technical and the legal side of the pending case I feel absolutely confident of an issue of the pending suit in our favour, I agree with you that the matter should be looked at more from the business than from the patent point of view because of the uncertainty which is always involved in an action, and I confirm that I am still prepared to agree to a friendly settlement of the pending suit under the following main outlines which comply with you and Mr. Robbins' suggestions."

Klotzbach's letter to Jeffries, March 26, 1936, shows that the negotiations between Krupp and British Thomson-Houston had broken down in a disagreement regarding the inclusion of Metropolitan Vickers in the production quota to be allowed to British Thomson-Houston. I introduce this letter as exhibit No. 80. A cablegram from Minor, president of International General Electric, to Jeffries, April 7, 1936, shows that the reason for Vickers' reluctance to agree to the terms of the proposed restrictive license was that it had been indemnified against all patent infringement liability presumably by Cutanit, Ltd., for whom it was manufacturing. I introduce this cablegram as exhibit No. 81. On April 14, 1936, Jeffries wrote to Minor, outlining his understanding of the entire British situation and suggesting various bases for the settlement of the dispute. Klotzbach's letter to Minor, June 27, 1936, shows that an effort was still being made to continue the negotiations. I introduce these letters as exhibits No. 82 and No. 83. The memorandum by Scudder of International General Electric, dated October 6, 1939, is an indication that an agreement was finally reached. In this memorandum Scudder stated "I understand that BTH Co. and Krupp have an agreement." I introduce this memorandum as exhibit No. 84.

The Krupp subsidiary in England, the Tool Metal Manufacturing Co., made its product from tungsten carbide powders imported from Germany. After the outbreak of the present war, therefore, its supplies from that source were cut off and it became necessary for it to obtain a new source of tungsten carbide powder. On November 22, 1939, Eveleth of General Electric stated in a memorandum that a representative of Krupp's former subsidiary in England had approached the Carboloy Co. in an effort to obtain supplies of tungsten carbide powder. I introduce this memorandum as exhibit No. 85. The memoranum indicates that plans were being made to supply such powders and that an arrangement would be made with British Thomson-Houston by which that company would receive a share of the profit on this transaction. These negotiations precipitated the situation in which the British Thomson-Houston Co. apparently placed its business affairs above the national interests of the United Kingdom and at a time when the future of that Kingdom looked very dark indeed.

A letter which I introduce as exhibit No. 86 is from Sporborg of British Thomson-Houston to Herod of International General Electric, dated March 30, 1940. It contains the following:

"We wanted to let you know that our relations with him are entirely friendly, and it is quite possible that we shall cooperate with him more closely in the future than we have done in the past, but so far we have not entered into any definite arrangements with him, nor have we arrived at a stage where we are prepared to exchange technical information with his Company.

"You will remember that under the old arrangement they obtained their raw material from Krupp and fabricated their tips in a factory at Coventry. Under present conditions, of course, that could not go on, and they are now obtaining their raw material in this country and doing the fabrication as well, but we have not yet decided to enter into a full exchange of technical information with them."

On May 24, 1940, in a letter which I introduced as exhibit No. 87, Herod replied to Sporborg to the effect that the Tool Metal Manufacturing Co., representative, Wickman, had discussed with Carboloy the question of an exchange of technical information between the two companies. Herod expressed the thought that Carboloy was in favor of making the proposed arrangement because it felt

Digitized by Google

that such an exchange would be mutually profitable. The letter also points out that the Wickman interests had bought the Krupp patents in England and the result was that the Krupp interests in England had been disposed of entirely. The following quotation then appears:

"Likewise, I pointed out to Mr. Wickman that we here in the United States were still under a license arrangement with Krupp and that such involved not only the United States but also certain limited export territories, and that we naturally were not disposed to prejudice our license arrangements with Krupp through any other deal at this time; * * *"

On June 6, 1940, Herod informed Robbins, president of Carboloy, that the final decision on the question of an exchange of information between Tool Metal Manufacturing Co. and Carboloy depended upon the desires of British Thomson-Houston. I introduced this letter as exhibit No. 88.

The Government has no additional information as to whether or not the agreement contemplated here was ever made. It is interesting to note, however, that the letter from Herod to British Thomson-Houston, dated May 24, 1940 (exhibit No. 87), states that an exchange of technical information between the two companies would undoubtedly be mutually profitable because Tool Metal Manufacturing Co. was in a position to make a contribution on the subject of steel cutting, on which subject Carboloy knowledge has always been woefully weak, and that the English company desired to receive information relating to making extrusion dies of tungsten carbide such as are used for stamping out shell casings, for rifle and artillery ammunition. It is obvious that such information would have been useful in England in the spring of 1940.

It is true that in many ways production has been more vigorously exploited in England than in the United States. Price and production figures which are available tend to show that the situation there is more favorable to production. Lower prices there have brought forth larger volume.

On the subject of the organization of the tungsten carbide industry within England, I introduced as exhibit No. 89 and quote from a letter from Chapman of British Thomson-Houston to Robbins of Carboloy, dated May 2, 1939, which explains the pricing system used in that country and contains, in addition, the following information:

"In order that you may have a picture of the present conditions over here I would ask you to note that we have, including ourselves, six manufacturers of hard metal, and these, together with their distributors, have recently formed an association which we call The British Hard Metal Association, the main object of which is to avoid wasteful competition amongst its members and to maintain agreed selling prices and conditions, and generally take whatever action is deemed advisable in regard to matters of general interest to the members of the association."

Subsequently a graph was prepared by Carboloy comparing American and British price levels. An examination of this graph shows that a medium-sized piece of tungsten carbide, weighing 10 grams, was priced in England at 20 cents for all quantities and that the cost in the United States was materially higher to all but a handful of very large purchasers; that in quantities of from 1 to 49, the price was 45 cents per gram; that in quantities of from 50 to 99, the price was 38 cents per gram; that in quantities of 500 to 999, the price was 25 cents per gram; and that in quantities of 3,000 or more the price was 11.3 cents per gram. I introduced this graph as exhibit No. 90.

The Union Wire Die Corporation

Stearns' letter to Krupp, February 21, 1929, which I introduced as exhibit No. 91, is with reference to the prices to be used by the Union Wire Die Corporation in its sales in the United States. Stearns argued that the agreement between General Electric and Krupp, although executed on November 5, 1928, was made effective as of April 17, 1928, and therefore that the contract between Krupp's associated company, the Wallram Co., and the Union Wire Die Corporation, being date in July 1928, was subject to the provisions of the Krupp-General Electric agreement. He then stated:

"In view of the above fact we shall have to ask the Krupp Company to make such arrangements with the Union Wire & Die Company as may be necessary to carry into effect this provision of our agreement; namely, that the Union Wire & Die Company shall sell, in the United States, dies made up with the use

Digitized by Google

of hard metal composition, at prices, terms, and conditions of sale fixed by the General Electric Company or its exclusive licensee, the Carboloy Company."

Stearns' letter to Krupp, April 27, 1929, which I introduce as exhibit No. 92, reports on his conference with Simons president of the Union Wire Die Corporation, with reference to the prices to be used by that company in its sales. The letter includes the following:

"I showed Mr. Simons the last paragraph of Article IV of the Krupp-General Electric Agreement, under the terms of which the Krupp Company agreed that "hard-metal composition of its manufacture which is imported into the United States, either directly or through the Wallram Company whether in the form of tools, dies, or parts thereof will be sold in the United States at prices not lower than the minimum price prescribed by the Licensor and on terms and conditions of sale, no more favorable than those prescribed by the Licensor," and asked Mr. Simons if he would recognize the right of the Carboloy Company to fix these prices.

"It was evident from my conversation with Mr. Simons that he did not care to recognize the right of the Carboloy Company to fix these prices.

"You will recall that it was at the urgent request of the Krupp Company that the General Electric Company finally agreed that hard-metal composition in the form of tools or dies would be sold in the United States at prices, terms, and conditions of sale which would be fixed by the General Electric Company and it, therefore, makes it extremely difficult for us to straighten out the situation with the Union Wire & Die Company without your assistance.

"I would therefore request your company to notify the Union Wire & Die Company that under the terms of the contract between Krupp Company and the General Electric Company, the Union Wire & Die Company are obliged to conform with the terms of this contract as far as prices, terms, and conditions of sale are concerned.

"Will you please give this matter your immediate attention and notify me by cable when you have sent word to the Union Wire & Die Company?"

General Electric made this attempt to fix the prices of the Union Wire Die Corporation, although Simons' contractual rights from Krupp were prior in point of time to those of General Electric and General Electric had notice of this fact. The "Memorandum Covering the Tentative Agreement Between the Representatives of the General Electric Co. and the Krupp Co. with Reference to Carboloy," April 17, 1928, which has heretofore been introduced as exhibit No. 17, concludes with the following:

"It is understood that the above tentative agreement is merely an expression of principles agreed upon by the parties present and in no way binds the General Electric Company and the Krupp Company."

Krupp's letter to General Electric, dated June 14, 1928, which I introduce as exhibit No. 93, contains the following:

"One of these reasons is that Dec. 1925 we entered into an agreement with the 'Gewerkschaft Wallram' in Essen to supply them with Widia material for the manufacture of wire-drawing dies. This contract empowers the above concern to export such dies to all countries. As a matter of fact, the Wallram Company furnish wire-drawing dies to various concerns in the United States and there is no possibility to compel the Wallram Gewerkschaft to desist from such exportation.

"Moreover, we have told you that we supply, since the beginning of this year, an American concern, with Widia material for the manufacture of wire-drawing dies, and this concern lays great stress upon receiving their material from us, now as well as in future. In fact it intends to sign a contract for the permanent importation of large consignments of dies. We think it would be very wrong to incur the ill-feelings of this customer who has become used to our material, and has collected experiences with it, by cutting off its source of supply."

Krupp, however, refused to recognize that the contract rights of the Union Wire Die Corporation were subordinate to those of General Electric, and in its letter to General Electric, dated October 14, 1929, which I introduce as exhibit No. 94, there is contained the following:

"This agreement which we made with Mr. Simons does in no way influence the contract between you and us. In Article 2 of the just-mentioned contract, section 1 expressively states:

" 'The present agreement is subject to the aforesaid agreement and to all existing other agreements which the Krupp Company has made prior to the date of the agreement.'

Digitized by Google

"After our contract with the Union Wire Die Company had been made, this firm has made a contract with the Gewerkschaft Wallram in Essen, which also has a right to exporting our 'Widia' drawing dies (compare article 2, section 1, of the Krupp-G. E. Company contract), in which last-mentioned contract the Gewerkshaft-Wallram has assigned its right of selling 'Widia' drawing dies in America to the Union Wire Die Company. After the Gewerkshaft Wallram had sold its right to the Union Wire Die Company we made a new contract with the Union Wire Die Company on the 7th of July 1928, from which we cite:

" 'Krupp undertakes to supply Rough Blanks for Drawing Dies of Widia or of similar metals for the sale in the U. S. A. exclusively to Mr. Simons, whereas Mr. Simons undertakes not to buy or sell any other metals as above than those manufactured by Krupp and the Gewerkschaft Wallram.

"Mr. Simons undertakes not to sell Dies of Widia or similar metals supplied by Krupp or Gewerkschaft Wallram for drawing metal filaments of incandescent electric lamps.'

"As you can see from the above, the Union Wire Die Company sells our Widia drawing dies in the United States, based on the rights which the Gewerkschaft Wallram had according to the contract and as recognized by you. The fact that we recognized this right which was given by the Gewerkschaft Wallram to the Union Wire Die Company, as an exclusive right, by our contract of the 7th of July has no influence on the legal relation between you and us and between you and the Union Wire Die Company.

"Our contract with the Union Wire Die Company does not contain any agreements with regard to the selling price. We could not make such conditions as the right which the Union Wire Die Company obtained from the Gewerkschaft Wallram did not have such condition. For the rest we did not have the duty to make such conditions on the 7th of July 1928 as the contract Krupp-G. E. Company did not yet exist. When this contract was made on the 5th of November 1928 it was besides mentioned in article 2 of the contract that all the contracts which existed before the date of the Krupp-General Electric Company contract therefore previous to the 5th of November, were not influenced by the contract Krupp-General Electric Company. We assume that these explanations have convinced you that we are not able to force the Union Wire Die Company to sell at prices determined by you, and that we also have no duty in this respect. Further, we will once more call attention to our letter, P. B. Nr. 2534A of March 18, 1929, in which we informed you that the Union Wire Die Company is ready at any time to come to an agreement with you concerning the prices on drawing dies. The Union Wire Die Company makes only the condition that the prices which are to be determined will not make the sale of drawing dies difficult in an unjust manner for the Union Wire Die Company or even make the sale impossible, and that you will not try to force the Union Wire Die Company from the American market by means of price scale.

"We hope that we have now sufficiently explained the Union Wire Die Company's objection and that you will regulate the question of drawing dies in a sensible manner with the Union Wire Drawing Die Company in your own interest. At the same time we confirm the receipt of your letter of the 23rd of August and the enclosures of the 28th of August.

General Electric, however, did not give up so easily its efforts to control Union Wire Die Corporation prices. A letter from Mallory, president of Carboloy, to Swope, president of General Electric, dated June 18, 1931, which I introduce as exhibit No. 95, contains the following:

"Sales of our Die Division have since inception been hampered by the activities of the Union Wire Die Corp.—Krupp's agent on this product in the United States. Although Krupp, in their original contract with the General Electric Company, undertook the responsibility of having Krupp's agent sell at prices, terms and conditions of sale as established by the Carboloy Company, we have never been able to bring the Union Wire Die Company under control. A great deal of time and money has been expended in the effort to accomplish this result. Mr. Stearns and Dr. Jeffries made a special trip to Europe in the Winter of 1930 looking to that end. Nothing definite resulted. Since that time a great deal of the time of our attorneys as well as myself, has been devoted to the solution of this problem which has interfered materially with our Die sales. After protracted negotiations this matter seems as of June 1st to be in as satisfactory shape as possible under existing conditions although not as satisfactory as if the contract terms had been adhered to by Krupp. As a result our Die Division is on a more substantial basis for favorable competition than ever before and should now begin to produce substantial sales volume."

Digitized by Google

Stearns' letter to Buck, March 20, 1931, which I introduce as exhibit No. 96, describes a conference which had taken place between representatives of Krupp and General Electric. The following appears:

"With reference to the Union Wire Die situation I presented proof that Mr. Simon was not selling dies in the United States at prices, terms and conditions by the Carboloy Company, and that *while I realized the General Company had no authority over the prices at which Mr. Simon sold this* material, *we did hold Krupp responsible* for the maintenance of prices on dies by Simon in accordance with the terms of the main agreement. Dr. Louis and Mr. Arzt after some discussion among themselves made the positive statement that they would see that Simon sold dies in the United States at prices established by the Carboloy Company."

The following memorandum written by Robbins, which I introduce as exhibit No. 97, is also of great interest at this point:

"Memorandum of conversation with Mr. Morris Simons of the Union Wire Die Corporation at Union Wire Die offices in New York City on June 16, 1933.

"The purpose of this discussion was to determine whether or not the Union Wire Die Company was selling dies to National Tube Company at a discount of 20% from the Carboloy Company Die Manual prices. Mr. Simons was asked if the Union Wire Die Company sold dies to National Tube at list prices less 20%. Mr. Simmons said that no such sale at that discount or any other discount from the manual prices had ever been made to National Tube Company. To substantiate this fact he produced the request for quotation received from National Tube Company under date of May 4th calling for a quotation on 6 tube dies. He also produced his quotation calling for these dies, quoting on them at the manual prices. The quotation did not, however, quote on the specifications given by National Tube in all instances. This quotation was on finished dies only. He then produced a quotation quoting on rough nibs in cases along with a letter to Mr. H. L. Boder, Purchasing Agent of the National Tube Company, Pittsburgh, stating that if they chose to purchase the dies listed on their quotation as finished dies in the form of rough nibs in cases the new quotation attached to the letter would apply.

"I asked Mr. Simons if either of the quotations had resulted in an order from the National Tube Company. He stated that they had not received either order from National Tube Company. I then told him that we had information to the effect that the National Tube Company Mill people at Elwood Works, Elwood City, Pa. were given information by the Purchasing Department in Pittsburgh that the Union Wire Die Company's first quotation on finished dies carried a discount of 20%. (Mr. Beardslee saw this written at the bottom of the prices submitted to the Mill people at Elwood City. It read as follows: 'Deduct confidentially 20% discount from all of the above prices.')

"Mr. Simons flatly denied that the Union Wire Die Company had quoted any such discount to either Elwood City or Pittsburgh.

"I then asked Mr. Simons if he had a contract with the United States Steel Corporation under which all subsidiaries of the United States Steel Company could buy dies at a discount from the manual prices. He emphatically stated that he had no such contract, further, that he contemplated no such contract.

"I then asked Mr. Simons if he had a contract with the Anaconda Wire & Cable Company and the American Brass Company. He stated that the had such a contract but that that contract was set up on the basis of the quantity purchased, the discount depending upon the amount of materials purchased in dollars with no time limitation set on when such quantities of dies in dollars should be purchased. He declined to tell me when this contract was dated or when it would expire. He said that the contract was still in existence and that he was disappointed that it had not expired. He further stated that when it did expire it would not be renewed and he had so informed Anaconda and American Brass.

"Considerable discussion ensued concerning the verbal agreement made by the Carboloy Company and the Union Wire Die Corporation before May 15, 1932. Mr. Simons' understanding of this agreement agreed with mine in that all contracts relative to the leasing of dies and any other contracts with die users entered into prior to May 15, 1932, could be performed in accordance with their terms but could not be extended.

"I then asked Mr. Simons if he had a contract with American Steel & Wire Company granting them in any way a discount from the Carboloy die manuel

Digitized by Google

prices. He admitted that such a contract was in existence. I asked him when this contract was signed. He declined to tell me when it was signed but admitted that it was signed prior to May 15, 1932. I then informed him that he had agreed with us prior to May 15, 1932, that no contracts with the exception of Anaconda and American Brass which were already in existence would be signed by the Union Wire Die Corporation excepting contracts for the leasing of dies which had already been submitted to customers. He told me at that time that there were four or five such contracts, two of which he expected to close.

"I told him very frankly that I looked upon his signing of the American Steel & Wire contract as a breach of our verbal agreement. He denied this and said that his understanding of the agreement dealt with contracts of all types rather than leasing contracts.

"I then asked him if the contract granted 20% preferential discount over the manual prices. He denied that the discount was literally 20%. I then asked him if the 20% discount applied to only finished dies. He agreed that this was the discount in the contract.

"I then asked him if the American Steel & Wire contract also called for the regular monthly discounts as listed in the manual. This he did not definitely answer except to say that he had never sold them sufficient dies to grant the maximum discount of 20% on any one order.

"I then told him that National Tube Company must have purchased their dies through American Steel & Wire Company. He admitted that I had guessed correctly and stated that it was not in intention when the American Steel & Wire Company contract was signed that all of the subsidiary companies of United States Steel Company should come under this contract. He refused, however, to change the arrangement.

"I then served notice on Mr. Simons and the Union Wire Die Corporation to the effect that the Carboloy Company and its Licensees were completely through with dealing with him on any basis which would in any way give him a price advantage on the sale of dies of any class to any customer. He stated that he had to have such an advantage to cope with the reciprocal position of the General Electric Company with certain large steel companies. I told him that regardless of reciprocal relations or anything else our prices were going to meet his prices one way or another.

"I further informed Mr. Simons that the Carboloy Board had agreed to proceed with arbitration under the terms of the Krupp-G. E. agreement to determine whether Mr. Simons' contract with Krupp came under the stipulations of the G. E.-Krupp agreement. To this he answerd that he was more anxious to see the contract arbitrated than we were to arbitrate it. He gave no reason for this statement.

"I then told Mr. Simons that we were in position to drop our prices 40% if need be to compete with him on his preferential discount arrangements. He said he would call such action suicide on our part. After a long discussion as to the result of our lowering the price generally Mr. Simons admitted that our prices to large consumers should be the same as his. He then asked me how this could be accomplished.

"I gave him the following four alternatives:

"(1) That all of his existing contracts of that nature should be cancelled.

"(2) That the prices agreed upon in these contracts should be raised as much as possible and that Carboloy Company and its licensees should meet the new prices to the large users.

"(3) That the present contracts should stand to their expiration date and that the contracts would be granted by the Carboloy Company and all of their licensees.

"(4) That the Carboloy Company and their licensees should meet the situation by a general price reduction sufficient to enable them to get business independent of the Union Wire Die Corporations' prices.

"Mr. Simons stated that he was in favor of raising the prices under the existing contracts as listed above in alternative 2. He stated that he would have to confer with his attorneys before giving me a definite answer in this respect. I then told him that under any arrangement whereby we would continue to cooperate with him on prices it would be necessary for him to lay on the table for our inspection all of his existing contractual relations including leases, and in the event of any agreement he would have to give us in writing a statement to the effect that such contracts exhibited comprised all of the contracts now

Digitized by Google

in existence by the Union Wire Die Company and that no future contracts would be made. This he would not agree to.

"I told him that he would have to answer this matter to me by Friday, June 23d. He promised definitely to give me information pertaining to the way he intended to handle this matter before that date."

Subsequently in 1936 when General Electric was endeavoring to induce Krupp to withdraw from the American market, General Electric found it necessary, in order to persuade Krupp to enter into a contract, to satisfy Krupp's contractual obligation to the Union Wire Die Corporation. In order to induce Union to relinquish its rights to do business, concerted action was taken by General Electric and Krupp. In the letter from Krupp to Robbins, president of Carboloy, October 22, 1936, which I introduce as exhibit No. 98, it is shown that Krupp had suspended shipments to the Union Wire Die Corporation alleged because payments for previous shipments had been withheld. The letter contains the following:

"Our new prices have been so arranged that they are not below half of your list price less 30% for freight, duty, insurance, etc., which Simons has to bear himself, consequently, he isn't under any circumstances better off by buying from us than ordering from you according to your offered arrangements. We couldn't however, enforce your demand to use the list price of the next larger size of all intermediate sizes of your manual as long as the intermediate size deviated only slightly from the next smaller size. In this case we arrived at a medium price. The result of our negotiation has been established in a contract, of which we enclose a copy for your information. At the same time we enclose a copy of a writ, describing the changes in the contract, which Simons requested. Inasmuch as these alterations increase the total shipments up to July 7th of next year only 13 kg. we have approved these reforms. As you will note from the contract, Mr. Simons intends to reorder for the time being the small quantity of 20 kg. For the remainder of the quantity as arranged in the Schedule attached to the contract he only wants the assurance that we supply them for the agreed prices. From this and from the conduct of the negotiations in general we have come to the opinion that Simons intends to negotiate anew an understanding with you, but first wanted to secure a supply from us. For this reason and in order not to render more difficult any future negotiations for you we have not granted any more concessions than circumstances compelled us to. The original of the enclosed contract we have sent to Messrs. Briesen & Schrenk, 49 Wall Street, New York, along with our agreement and a copy of Mr. Simon's enclosed letter and have asked Messrs. Briesen & Schrenk to have the contracts endorsed by Mr. Simons, issue a contract and hand him the enclosed letter which is part of the agreement.

"We have just learned from Mr. MacKenzie that you have planned to reduce prices for dies. If this reduction or the intentions for one become known to Mr. Simons it is to be expected that he will refuse to sign our contracts and that he will demand a price reduction from us accordingly. Provided a reduction in die prices will go into effect after Simons has signed the contracts he no doubt will be more inclined to reach an agreement with you, because he will, under the recently offered agreement, i. e., 50% off list prices, buy more favorably from you than from us according to the agreed prices. We cabled you therefore as follows:

" 'For Robbins have negotiated with Simons re further shipments till July next Stop Respective contracts mailed today for his signature Stop Before doing anything await our detailed informatory letter please inform Jeffries.

'Louis.'

"As soon as Mr. Simons has signed the contracts we will without delay inform you and kindly ask you to also keep us informed of your negotiations with Simons.

"We are sending a copy of this letter direct to Dr. Jeffries for his information.

"We pray to keep the foregoing subject strictly confidential and not use any of it in negotiating with Simons."

Negotiatons between Carboloy and Simons, president of Union Wire Die, continued for some time and on April 2, 1937, Robbins, of Carboloy, wrote to Louis, of Krupp, and reviewed the various plans which had been discussed in the course of these negotiations. The last three paragraphs of this letter are as follows:

"After all of the discussions on the various propositions mentioned herein Simons has made many threats. For example, he threatens to infringe and con-

Digitized by Google

tinue business; he threatens to manufacture tool material on an infringing basis and insofar as he can, upset the tool market; he threatens to sell all of this stock to several of the large users and retire from business, and many other threats.

"Now, in definite answer to your letter of March 9th we do not feel that an extension of any type whatsoever of this agreement between yourselves and Simons would do anything other than to complicate our problem, consequently, we will flatly refuse any such request. Rather, we would counsel you to strongly bring as much pressure as possible on Mr. Simons to keep the material covered by the contract out of the United States. We feel that you have means by which this can be accomplished. Mr. Simons is now contemplating a trip to Paris to meet with you in which we know that he will make many lucrative offers to get this contract extended or to get it revised in some manner. Our position in this matter is as above stated, namely, that you must not only refuse to extend his agreement or to revise it in any way, but that you should also bring all possible pressure to bear on Mr. Simons under the agreement.

"This has been a hard matter to cover by correspondence, but I believe that I have covered the main points. I will be pleased to advise you of any further developments in this matter which would be of interest to you."

(Introduced this letter as exhibit No. 99.)

Thereupon, on the day which marked the termination of the 3-year purchase contract between Krupp and Union, July 7, 1937, an agreement was made between Carboloy and Simons, president of Union Wire Die, under which Carboloy purchased the business of Union for approximately $950,000. At the same time Simons was placed upon the Carboloy pay roll as a consultant at an annual salary of $5,000 per year and Simons agreed that he would not engage in the tungsten carbide business during the term of his contract of employment.

Vertical price maintenance

The result of the patent pool and the license agreements subsequently made was that the prices charged in the United States by substantially all manufacturers were at the same level. Not being content with this type of horizontal price fixing, General Electric and Carboloy have continuously followed a policy requiring vertical price maintenance as well. This has been done through the medium of "agency" contracts entered into between Carboloy, its licensees, and the American dealers of Krupp, with the machine tool builders and the manufacturers of small tools embodying tungsten carbide. It is not my purpose in these hearings to explain in any great detail the reasons why the "ostensible" contracts of agency were inadequate, we believe, under the law to make the tool manufacturers the true agents of the Carboloy Co. or any of the other manufacturing licensees. It is rather my purpose merely to touch upon this issue and briefly to point out some of the evidence which tends to show that the aforesaid agency contracts did not represent or truly describe the actual course of dealing between these purported principals and their so-called agents. On November 14, 1928, Stearns, of General Electric, wrote to Jackson, of the General Electric law department, as follows:

"You will recall that I recently asked you if it would be possible, in any way, for the Carboloy Company to control the prices at which tool makers purchasing carboloy from the Carboloy Company and using this carboloy in the manufacture of complete tools would be required to maintain prices, terms, and conditions of sale fixed by the Carboloy Company.

"At the time I asked you this question, you stated that you thought some method might be worked out whereby this could be done."

I introduce this letter as exhibit No. 100.

Apparently, in connection with the above request, the following statement was made by Rich, of the General Electric patent department, to Buck, also of the patent department, dated November 22, 1938:

"The only way I can see of the Carboloy Company handling the tool situation, about which you spoke to me, is for the tool manufacturer to sell to the Carboloy Company the shanks or holders, the Carboloy Company then to manufacture the Carboloy portion of the tool, mounting the same on the shank or holder and appointing the manufacturer of the shanks as to the agent of the Carboloy Company for the sale of the complete tool, only at such prices, upon such terms, and under such conditions as may be established by the Carboloy Company from time to time.

Digitized by Google

"I have talked to Mr. Bayard about this, and from his study of the law he sees no objection to it. Mr. Bayard and I do not see any other way of the Carboloy Company furnishing the completed Carboloy portion of the tool and fixing the prices at which the complete tool can be sold."

I introduce this letter as exhibit No. 101.

The following excerpts from Carboloy's correspondence tend to show the manner in which the purported contracts of agency were observed by Carboloy and its so-called agents. On May 1, 1934, Peterson, of Carboloy, wrote to Robbins, president of Carboloy, as follows:

"I contacted Heald Machine Co. last week with Macduff and Mr. Bestick is reluctant to sign the contract in its present form only for the reason that it states that they are to make a report on all material drawn out of their inventory. I told him that this clause was only put in there for people that might want to carry a consignment under this contract, but in their case where it is all paid for as purchased that it would not be necessary for them to make any reports, but to cover himself he asked for a letter from you stating that it would not be necessary for them to make the monthly report due to the fact that all their tools and tips were bought outright, so I would ask that if this is in order that you write a letter to the attention of Mr. G. C. Bestick so as he can pin this to his copy of the contract."

I introduce this letter as exhibit No. 102.

Robbins' reply, dated May 8, 1934, was as follows:

"Under the new arrangement it will be necessary for Heald to make a monthly report. If it is the desire of the Heald Company to remit at the end of each month for all materials purchased during the month this form will simply list the purchases made during the month and be attached to their remittance.

"I am sure that you understand the consignment arrangement—namely, all merchandise is supplied by us on consignment whether it happens to be an actual physical consignment or not. In most cases we do not have a physical inventory in the Agent's plant, nevertheless, all goods are shipped on consignment. This is the only way in which the price can be maintained by us.

"I would much prefer not to write a letter to Mr. Bestick on this matter if there is any way of your getting it straightened out. I feel sure that if you will explain the matter to him in this light I am sure he will be satisfied to go along under the new arrangement."

I introduce this letter as exhibit No. 103.

On occasion the holders of these so-called agency contracts objected to the amount of extra bookkeeping and reporting which was required by the terms of the contracts. The following excerpt from a letter from Fullagar, of the Carboloy Co., to Robbins, dated August 2, 1935, with reference to the Barber Colman Co. of Rockford, Ill., a large machine tool manufacturer, is pertinent on this point.

"I believe that this account could be handled much the same as the Ingersoll Milling Machine Company, that is, Ingersoll refused to make up their monthly statement, also they will not write up their regular CR requisition. Both of these functions are handled by us in this office. We write up the monthly statement and send it to them each monh; also, we accept their regular purchase order and transfer its contents to our regular CR requisition, which is returned to Ingersoll for signature, and, so far, everything has worked beautifully, and I think we will have to handle Barber Colman the sume way providing you pass on the deletion of paragraph 22."

I introduce this letter as exhibit No. 104.

The relationship between Carboloy and its various so-called agents is so much like that of vendor and purchaser that the officials of the Carboloy Co. itself often, in unguarded moments, refer to these people as "purchasers" and the transaction between the so-called agent and the ultimate consumer as a resale. For example, in identical letters to the Warner & Swasey Co. of Cleveland, April 20, 1934, and the Jones and Lamson Machine Co. of Springfield, Vt., April 17, 1934, which letters were apparently sent to all holders of Carboloy Form E contracts, the following appears:

"This Appointment of Agent supersedes all other agreements in existence by the Carboloy Company and we are sure that in offering this to you we are giving you a far more desirable *resale* arrangement than you have been able to secure heretofore." [Emphasis supplied.]

I introduce these letters as exhibits Nos. 105 and 106.

Digitized by Google

Also, for example, in Robbins' letter to Van Norman Machine Tool Co., January 14, 1935, with reference to certain tungsten carbide sold by Carboloy to a particular company, the following appears:

"At the time that material was sold by us we naturally presumed that it was for their own use since, as you know, we do not sell Carboloy to anyone for *resale* except under agency agreements such as you operate under." [Emphasis supplied.]

I introduce this letter as exhibit No. 107.

In W. G. Robbins' letter to Fred Robbins, January 14, 1935, the following appears:

"For your information, the set-up is as follow: First, we are not permitted to *sell* Carboloy for *resale* without the signing of one of our *resale* agreements. Second, all of the people supplying boring bars and tools for boring cylinders have signed such contracts. By signing the contract they are legally bound to resell Carboloy tools at prices prescribed by us." [Emphasis supplied.]

I introduce this letter as exhibit No. 108.

Reference should also be made to the excerpt from the letter from Stearns to Jackson, dated November 14, 1928, as follows:

"You will recall that I recently asked you if it would be possible, in any way, for the Carboloy Company to control the prices at which tool makers *purchasing* carboloy from the Carboloy Company and using this Carboloy in the manufacture of complete tools could be required to maintain prices, terms and conditions of sale fixed by the Carboloy Company."

"At the time I asked you this question, you stated that you thought some method might be worked out whereby this could be done." [Emphasis supplied.]

I have heretofore introduced this letter as exhibit No. 100.

Price fixing of unpatented tools

Tungsten carbide is never used alone but is always attached to a tool for which it is used as a cutting edge. The hard-metal composition constitutes only a small part of the weight of a typical metal-cutting tool. It is also true that the relative proportion of values to be attributed to the patented and unpatened parts of such a tool shows a like disparity. This is not because the steel which is used is so very expensive but because the labor involved in attaching the hard-metal composition to the steel shank and in grinding and otherwise shaping the completed tool is of such consequence that the value of this labor often exceeds the value of the tungsten carbide contained in the tool. For example, a typical tool having a 5 gram blank on a steel shank three-quarters inch square would cost $8.40 as a finished tool while the 5 grams of tungsten carbide incorporated in that tool was priced at only $2.25. This is an average comparison of relative values. The proportions could be made much more one-sided. For example, a standard Carboloy tungsten carbide blank might be used weighing 4.98 grams which, under the price schedules in effect prior to the indictment of August 30, 1940, was priced at $1.80. In addition, there are certain categories of tools which involve extra fabricating work. If the tool above mentioned were given such extra finishing, the value attributed to the unpatented part would be $9.32 as compared with the $2.25 or $1.80 for the value of the tungsten carbide contained therein. Nevertheless, Carboloy has required its so-called agents, and its licensees and their so-called agents to sell at fixed prices not only the hard metal composition claimed to be covered by the pooled patents, but has also set the price to be charged by them for the entire completed tool.

Carboloy has attempted to monopolize the tungsten-carbide industry by certain selling methods and by attempting to induce certain of its licensees to go out of business

In 1934 the Ludlum Steel Co., one of Carboloy's first licensees, surrendered its tungsten-carbide license and took a license under a new and different set of patents controlled by Carboloy. There is evidence to show that the grant of one license was the consideration for the surrender of the tungsten-carbide license. I quote from the letter of Jeffries, of Carboloy, to Morrison, of General Electric, dated October 4, 1933, which letter I introduce as exhibit No. 109:

"I had an opportunity to see Mr. Batchelor, Pres. of Ludlum Steel, Tuesday evening at his home in Albany. I stopped four hours between trains. My own mind was pretty well oriented at the outset and we had little difficulty in

Digitized by Google

agreeing in principle to the plan which I had formulated. I am determined that no set-up like the Carbide one will be made in this case. We do not want a free-for-all in the selling field nor do we want so many people in it.

"The general plan is as follows:

"1. Ludlum will cancel their carbide license and we will, insofar as possible 'take over' their agents and accounts. This bids fair to give us an added $75,000 business per year which should yield some $35,000 profit. There will be no written agreement on this point, however, but it is definitely understood that the cancellation of this carbide license is a prerequisite. This will help the carbide picture in addition to throwing carbide business our way.

"2. Ludlum will be given a nonexclusive license to manufacture and sell under Miller, Koster, Dean and Sykes to the extent of ⅓ the Carboloy-Ludlum combined total in dollars at a royalty of 7½% of net sales billed."

That a similar offer under the same conditions was made to the Firth-Sterling Steel Co., Carboloy principal licensee, is shown by the letter from Jeffries, of Carboloy, to Robbins, of Carboloy, dated March 8, 1934, which I introduce as exhibit No. 110.

"When I was in Pittsburgh on Monday it occurred to me that I could give Mr. Firth a brief résumé of the Alloy #548 situation so that he would have time for considerable consideration by his company prior to the time of our more general meeting. I therefore got in touch with him and spent an hour or more with him on Monday evening. I told him confidentially what we had arranged with Ludlum and gave him in general the whole #548 world picture. Very early in our discussion I indicated that the least we could do was to offer Firth the same arrangement that we offered Ludlum."

Carboloy has in truth been the dictator of the tungsten-carbide industry. Because it was such a dictator and because its regulations of "prices and terms and conditions of sale" were extended to the smallest details of the selling policies of the licensees, it was inevitable that the licensees should become of the opinion that Carboloy was promulgating its prices and terms and conditions of sale in such a way as to further its own business at the expense of its licensees. Whatever Carboloy's purpose has been, it is apparent that in many instances it has trampled upon the feet of its associated companies. For example, Carboloy has interpreted its discount schedule to mean that a quantity of "identical" pieces of tungsten carbide, while they must be of the same size, may be composed of various grades of hard-metal composition. Because certain of its licensees, to wit: The Vascoloy-Ramet Corporation and the American Cutting Alloys Co., have been restricted in the types of hard-metal composition which they could manufacture, it is obvious that a purchaser desiring to buy a number of grades of metal and naturally wishing to obtain the lowest price would purchase from a manufacturer making and selling a complete line of products.

A particular example of the manner in which Carboloy has used its power to fix prices is shown by the following incident. Prior to October 1, 1936, as you have seen, tungsten carbide was sold at a lower price per gram in the form of large pieces than it was in the form of smaller ones. When certain customers began to buy large pieces of tungsten carbide from the Firth-Sterling Steel Co. for the purpose of cutting them into smaller pieces, Carboloy changed the system of pricing to give the same price per gram for all pieces regardless of size. This was done in spite of the fact that it is often easier to make a large piece than a small one because of handling difficulties. I introduce as exhibit No. 111 a letter from Robbins, of Carboloy, to Merry, of Carboloy, dated February 11, 1935, and I quote from that letter as follows:

"I am quite sure that I can prohibit Firth-Sterling from propaganding large pieces of tungsten carbide to be subsequently cut up by the customer. There is nothing in the manual to prohibit this practice but we will not foster such a scheme. So far we have been able to keep all licensees in line on that matter."

I next introduce the letter from Robbins of Carboloy to Fullagar of Carboloy, dated June 2, 1936, as exhibit No. 112 and I read this letter in full:

"I have your letter of May 26th with reference to the question of large tips. It is true that this procedure has become permanent here with the Ford Motor Company. It was started by some of our competition and it is one of the means that is being used by Ford to break down our price structure.

"There is no question but what it will spread but at the same time we are not accepting orders from anyone else for such materials.

"It is our intention in the near future to so arrange the price manual that this will be out of order."

Digitized by Google

There is also considerable evidence that Carboloy has used its power to fix prices by informing principal customers far in advance of pending price changes. Every businessman will quickly understand the effect of this practice. I now introduce as exhibit No. 113, a letter from Jeffries of Carboloy to Jackson of General Motors, dated July 5, 1932, which clearly shows that Jeffries had informed the General Motors Corporation of a price change which took place 3 months later. I read from this letter:

"On my second visit on March 28, 1932, I explained to you that our attorneys would not allow us to offer the new material to General Motors Corporation at prices lower than those extended to other customers in like quantities. I then explained to you that we had worked out a plan to take care of the General Motors Firth-Sterling agreement, which was independent of the new material and which appeared, at least to me, to be very favorable to General Motors Corporation.

"We refrained from asking the Firth-Sterling Steel Company to cancel this agreement forthwith, but decided to allow the agreement to stand until such time as a price reduction on cemented tungsten carbide and on tools made therefrom became effective. I gave you an idea of the magnitude of these price changes and, in fact, the schedule on raw cemented tungsten carbide which I gave to you in confidence is exactly the schedule which became effective on June 30, 1932."

At a meeting in 1938 of the Carboloy executives, Robbins is reported to have said, and I quote as follows from a document previously identified as exhibit 58:

"We are committed to a 10¢ per gram minimum price in quantities on January 1, 1939. This commitment was forced by the threats of large customers to do their own manufacturing. One had already started and another was practically ready."

In its desire to retain for itself the lion's share of the General Motors business, Carboloy has expressly gone so far as to grant a secret rebate to the prices established by itself for itself and its licensees. In 1939 Carboloy set up a procedure which would enable General Motors to purchase at the maximum quantity discount regardless of whether or not it purchased the necessary quantity of each size and type of piece bought. I quote from the letter of Campau of General Motors to Carboloy, dated June 14, 1939, which I introduce as exhibit No. 114:

"Attached you will find our Purchase Order No. 12803 covering three thousand (3,000) each of the tip sizes selected by our Tool Standards Committee, with your approval.

"You will note we have not mentioned in this order anything relative to the invoicing to the Corporation of any unshipped balances of these tips after sixty days has elapsed from date of order. It is our understanding you propose to bill such unshipped balances to us, but it is understood between us these invoices will never be paid. You have expressed willingness to send us credit offsetting such invoices thirty (30) days after receipt of same, if we so desire."

Subsequent information in possession of the Department of Justice indicates that in many instances General Motors did not purchase in large quantities required to qualify it for the minimum price.

Carboloy has also used its position as a General Electric subsidiary in order to induce prospective buyers to purchase its product by calling to the attention of such prospective purchasers the fact that the reciprocal business done by General Electric had been substantial. In Jeffries' memorandum of October 29, 1931, which has previously been identified as exhibit No. 11, the following appears:

"The reciprocity feature should be an important one in the future activities of Carboloy Company, Inc."

The Carboloy discount schedule prevented potential competition, and the effect thereof has been unnecessarily to discriminate between purchasers

Immediately prior to the indictment, the Carboloy price schedule was established at about $205 per pound, but certain large consumers, such as Ford and General Electric, were granted discounts from this figure of 75 percent and 10 percent, which made the price as to them approximately $45 per pound. This schedule of discriminatory discounts was first inaugurated and has subsequently been employed due to the threats of certain large consumers to avoid the necessity of paying high prices for tungsten carbide for manufacturing for their own use. I introduce as exhibit No. 116 a letter from Anderson of General

Digitized by Google

Electric to Boynton of General Electric, dated March 26, 1937, and I read as follows from that letter:

"While I do not know of anything for you to do on the matter, I thought you should know that Carboloy is in a very serious jam with Mr. Weibel, Director of Purchases, and Mr. Sorenson at the Ford Motor Company.

"As we understand it, Ford's have gone ahead to manufacture tungsten carbide and tools for their own use, entirely disregarding the Carboloy patents. When Mr. Robbins called this to their attention and pointed out their patent infringement, they indicated to him that they were doing a going rate of ten or twelve million dollars a year with General Electric and so should not have any trouble about patents on Carboloy."

I quote also from a letter from Robbins of Carboloy to St. Clair of Carboloy, dated April 28, 1937, which I introduce as exhibit No. 117:

"* * * the scheme of reducing the prices as the quantity of tips per order goes up will at the present time solve the major difficulties we have in the field, particularly with large users. We are primarily concerned in this change with quickly stopping the manufacture of carbide on the part of two or three very large users to infringing competition which at the moment is flaring up very formidably * * *. I agree with you that the lower price per gram in large pieces is coming and will be in effect eventually. The present scheme is in that direction and will solve our problems now."

I now quote from a letter from Robbins of Carboloy to McKenna of Vanadium Alloys Steel Co., a Carboloy licensee, dated June 17, 1937, which I introduce as exhibit No. 118.

"I was able yesterday, in view of the new Price Manual, to get the Ford Motor Co. to give up their further plans in connection with the manufacture of tungsten carbide and to get them to offer for sale the equipment which they have on hand to you and to us if we want it."

On December 10, 1938, Robbins of Carboloy wrote to Weibel of Ford, informing him of the new Carboloy price schedule and inclosing a tabulation comparing present prices with those calculated under the proposed manual. The tabulation shows that under the new price list Ford would be able to purchase tungsten carbide for as low as 11.3 cents per gram, less 10 percent quantity discount and one-half of 1 percent cash discount. The tabulation shows that purchasers in quantities of from 1 to 49 identical pieces would have to pay at the rate of 45 cents per gram. I introduce this letter as exhibit No. 119.

An illustration of an apparent suppression of one use of tungsten carbide

One of the first successful applications of cemented tungsten carbide was in the making of phonograph needles. A memorandum from Morrison of General Electric to Davis, a General Electric vice president, dated March 29, 1928, which I introduce as exhibit No. 120, contains the following paragraph:

"On February 17, 1928, I filed an application for George F. Taylor, Serial No, 255,145. This application covers a phonograph needle made of carboloy. The needle may be squirted or pressed according to the Gilson or Hoyt processes. One of these needles played 500 phonograph records and when examined under the microscope did not show the slightest sign of wear. After playing these records the needle was accidentally broken so that we do not know just how good the needle is. It appears to me, however, to be a remarkable product and far superior to the ordinary tungsten needle."

The patent pooling agreement between General Electric and Krupp, dated November 5, 1928, contains several specific reservations in favor of prior agreements entered into by the contracting parties. In the second paragraph of article II it is stated that General Electric by a prior agreement with the Radio Corporation of America and others "has granted and agreed to grant certain exclusive and nonexclusive licenses under its United States patents and patent rights in the fields of telephone, telegraphy, and radio, and is obligated to treat all devices for and in connection with the production of sound and/or pictures for entertainment, educational, and similar purposes, as radio devices."

I introduce a memorandum of Buck of International General Electric, dated April 29, 1930, as exhibit No. 121. It is written with reference to a proposed agreement between International General Electric and Krupp, further clarifying the rights of General Electric and Krupp as to various territories. It contains the following:

Digitized by Google

"Krupp ought not to be permitted to import phonograph needles or material for making phonograph needles into the United States."

On September 25, 1931, Goldsborough, a patent attorney for the RCA Victor Co., wrote to Dunham of the patent department of General Electric, as follows:

"There is a possibility that this company will desire to manufacture carboloy needles, particularly for use in connection with long playing phonograph records and automatic phonographs.

"It is my personal understanding (I have no written data) that General Electric has rights in this country relative to carboloy or Widia which they acquired from abroad and that these rights are extended to us for phonograph purposes by virtue of the inter-company agreements. Please advise me as soon as convenient whether or not my understanding is correct. In the event that we have the right to use carboloy for phonograph needles, must we obtain the material from your company or may we manufacture it ourselves?"

I introduce this letter as exhibit No. 122.

General Electric's reply, written by Morrison, which I introduce as exhibit No. 123, was as follows:

"The General Electric Company has rights in this country in connection with the manufacture and use of cemented carbides and certain of these rights extend to the R. C. A. Victor Company. You have the right to use this material for phonograph needles. However, you will have to obtain the material from the General Electric Company since the Carboloy Company has no rights under G. E. patents in connection with sound reproducing devices.

"I believe that if it is necessary to do so it might be possible for the General Electric Company to sell the powdered raw materials to the R. C. A. Victor Company and for that company to fabricate the needles."

All this was in 1928–31. But the department knows of no attempt to commercialize phonograph needles made from tungsten carbide until very recently. In the March 28, 1942, issue of the New Yorker Magazine appears an advertisement of a long-lived needle which appears to be made from tungsten carbide. The advertisement states that this product is being manufactured by the Pfanstiehl Chemical Co., of Waukegan, Ill., which is probably very closely related to the Fansteel Metallurgical Corporation of North Chicago. The latter company was a Carboloy licensee from 1933 until 1940. I introduce the advertisement as exhibit No. 124.

PROFITS OF CARBOLOY CO., INC.

Carboloy's profits have not been large, relatively speaking. The department believes this is accounted for by the patent pool's drastic limitations upon production. But it has been represented that Carboloy's early losses incurred in exploiting tungsten carbide amounted to about $1,500,000 by 1931 and that these early losses were not recouped until 1940. It has also been stated by Carboloy officials that the company first got out of the red in 1932 and first began paying dividends in 1935. See memorandum dated July 5, 1935, of Jeffries which I now introduce as exhibit No. 125. Such representations require some explanation. In the first place, it appears that once dividends began to be declared they were substantial. For example, net profits available for dividends in the year 1935, after deductions of interest, taxes, and other charges, amounted to $375,000, according to Jeffries' letter to Swope, December 15, 1935, which I introduce as exhibit No. 126. The dividend declared in the year 1936 was in the amount of $322,000, according to the letter from Oberle of Carboloy to General Electric, dated December 10, 1936, which I introduce as exhibit No. 127. Furthermore, a study of the accounting procedures and financial practices which have been followed by Carboloy show that the company not only had recouped its early losses by 1940 but had practically accumulated out of profits its entire capital expenditures prior to that time. The following are some of the profit items which are not shown on Carboloy's balance sheets:

1. *Interest charges.*—Carboloy Co. was capitalized by only about $200,000 in cash and by about $1,400,000 in loans made to it by General Electric up until 1933. These loans carried interest in the amount of 5½ percent which was charged to expense. See the letter from Van Dyck of General Electric to Whitestone of General Electric, October 24, 1933, which I introduce as exhibit No. 128. The effect of this type of financing upon Carboloy's affairs is shown by the fact that of the $142,858.88 shown as losses during the first 9 months of 1931, $70,534.38 was accounted for by interest paid General Electric and by

Digitized by Google

manufacturing profits paid to other divisions and associates of General Electric. See exhibit No. 11. The loans were largely repaid out of profits by October, 1936, after Carboloy had also paid to General Electric over $300,000 in the form of interest.

2. *Cost-plus manufacturing contracts.*—Until it acquired a factory of its own about the first of 1938, Carboloy always paid 15 percent in addition to the cost of the manufacture of tungsten carbide and the tools and dies embodying tungsten carbide which were sold by it. It is estimated that on account of these arrangements the Cleveland Wire Works of General Electric received about $450,000 in manufacturing profits. This estimate is based upon data such as the following: In a letter from Jeffries, president of Carboloy, to Swope, president of General Electric, dated June 25, 1934, which I have introduced as exhibit No. 129, Jeffries reported that Cleveland Wire Works of General Electric "shows a profit of over $10,000, after allowing for $15,000 home office loading and $7,000 other loading items" for the first 5 months of 1934. In addition, a letter dated December 15, 1935, from Jeffries to Swop, which I have just introduced as exhibit No. 126, states as follows regarding Carboloy's operations for 1935: "The net profit after tax, interest, and other charges should be around three hundred twenty-five thousand. The incandescent lamp department should be at least sixty thousand better off for the year because of their billings to the Carboloy Co."

3. *Charges by General Electric Research Laboratory.*—The development costs do not form part of the capital expenditure shown on the Carboloy Co.'s statement because of the practice by which the General Electric Research Laboratory submits bills periodically to the various General Electric divisions on account of research work done.

4. *Royalties.*—By virtue of the various license and pooling agreements, General Electric received one-third of the royalty payments which have been made by Krupp and the various Carboloy licensees until the patents were declared invalid in 1940. This payment was at the rate of $1.66 per pound and amounted to a total of at least $60,000 by 1939. In addtiion, General Electric has received royalty payments from Carboloy in the amount of $1.66 per pound until June 1936.

EXHIBIT No. 129

TETRACENE

Statement by Allen Dobey

My name is Allen Dobey, and I am and have been since August 1938 a special assistant to the Attorney General, attached to the Antitrust Division of the Department of Justice, and engaged in the prosecution of violations of the Sherman Act. I appear here in obedience to subpenas duces tecum served upon me and upon my superior, Mr. Thurman Arnold, Assistant Attorney General. Pursuant to these subpenas, I am producing 29 exhibits, which are for the most part copies of original communications and other documents from the files of the Remington Arms Co. The Remington Arms Co. is a corporation controlled since 1933 by E. I. du Pont de Nemours & Co., and is engaged in the manufacture and sale of guns, rifles, and ammunition. Its principal executive offices and its principal plants are located at Bridgeport, Conn.

The documents I am producing (and the facts they disclose) were first revealed to the Government when they were submitted in obedience to a subpena duces tecum served in aid of a routine grand jury investigation of possible violations of the Sherman Act. The subpena was issued June 19, 1941, and the documents which I am producing have been in the possession of the Department of Justice since sometime last fall.

Except to answer such questions of the committee as I may be qualified to answer, I shall confine my testimony to a recital of the facts which are set forth in the documents—in the main quoting directly from the documents themselves—and to comments which may be necessary for purposes of explanation. I understand that the purpose of these hearings is not to punish for any violations of law or questionable practices, or to impugn the motives or question the patriotism of any person, but rather to discover what, if anything, is wrong with the present patent system in the light of the existing emergency. I shall endeavor to point out from the evidence in my possession practices which may be encountered under our present patent system—which practices may need correction.

Digitized by Google

Before taking up the evidence in detail, I may say briefly that the documents at hand will disclose the following story of the use or abuse of the patent rights and of the business opportunities which the possession of a patent affords.

Since 1929 Remington has owned United States patents covering priming compositions containing tetracene. Tetracene is a chemical compound used with great success as a sensitizer or combustion initiator in a priming composition. A priming composition is a sensitive composition of matter which operates upon receiving a blow and serves to cause the combustion of the propellant powder which discharges the projectile. As owner of these patents, Remington has acquired the exclusive right to make, use, and vend this product. As far as these patents are concerned, Remington may make and sell the product in foreign commerce in any part of the world, and may license others to do so likewise. But, by the force of an international cartel agreement founded upon patent controls, entered into in 1929 for the life of the patents and still in force and effect (an international agreement entered into with German corporations, Rheinisch-Westfaelische Sprengstoff, A. G., and Dynamit, A. G., subsidiary companies of I. G. Farbenindustrie), Remington has been prohibited from selling any military ammunition whatever containing any of this priming composition to any of the countries of the British Empire. For example, Remington may not sell such military ammunition to Great Britain, or to Canada, or to the Irish Free State. This is not because British, Canadian, or Irish Free State patents would be infringed. Remington is licensed to sell in Great Britain by the British owner of the British patent covering this product. The Canadian patent covering the product held by Canadian interests is considered invalid. In the Irish Free State there is no patent at all. No; such sales are prevented solely by reason of this cartel agreement with these German companies.

As late as January 1941 the terms of this agreement with the German companies were actually invoked to bring a halt to sales by Remington of such military ammunition to the British Purchasing Commission and to the Union of South Africa.

The documents at hand and the facts they present will point up the following features which may be of interest to the Committee on Patents:

1. A German corporation which has sold a United States patent to an American corporation may still by agreement effectually prohibit that American corporation from selling the product covered by the patent even in countries where there are no patents owned by anyone which would be infringed by such sales.

2. By such agreements this American corporation, although it owns the patent, may still be prohibited by the German corporation from permitting any American licensee to sell the product outside the limits of the United States.

3. By such agreements these restrictions may be imposed not only on the patented product, such as the priming composition here, but upon any unpatented military ammunition which happens to contain a small quantity of this primer, although the military ammunition so restricted may be in volume and in value many times greater than the patented primer.

4. Thus, by such agreements, our American exports, our American productive capacities and our aid to our British Allies may be and are restricted by German interests which have no patent rights whatever to protect by such restrictions.

5. By such agreements, such German interests have been in a position to obtain, through reports required of the American concern, by the right to inspect its books, and by a computation of percentage royalties, exact information as to the amount of such military ammunition sold to the United States Government or to its allies or to anyone else.

6. By such agreements the German interests are permitted to exact royalties on tetracene primed ammunition sold by Remington, even upon that sold to the United States Government for its prosecution of the present war. But, nevertheless, the title to the patent, which patent alone gives rise to the right to such royalties, having been assigned to Remington instead of being retained by the German interests, may not be taken over in time of war with Germany by our Alien Property Custodian. This is true even though the German company may exact a reassignment of the patent in the event that royalties in sufficient amount are not paid by Remington.

It is my opinion that this cartel agreement could be voided under the antitrust laws as an unreasonable restraint of our foreign commerce, particularly in view of the fact that full title to and ownership of the United States patents is vested in the Remington Arms Co., and Rheinisch-Westfaelische Sprengstoff, A. G., no longer owns the patents in Great Britain and Canada. However, it

Digitized by Google

may be that the law relating to this restraint and similar restraints should be clarified by an amendment to the patent law. Consideration might be given to amendments outlawing agreements contained in patent assignments or patent licenses which prohibit or restrict the production, distribution, or exportation of patented articles.

PATENT HISTORY

In about the year 1922 a German inventor, Hans Rathburg, discovered that tetracene could be used in lieu of mercury fulminate as the sensitizer in a priming composition.

The use of mercury fulminate in a priming composition had a number of disadvantages. As set forth in a memorandum from the files of the Remington Arms Co., dated September 27, 1928, apparently written by L. J. Herrmann, works manager of the Remington Arms Co., these disadvantages were as follows—I quote (exhibit No. 1):

"1. The price of mercury is inclined to increase rather steadily, and with it the price of all mercury compounds must increase.

"2. All of the important deposits of mercury are in foreign countries, and this might result in curtailing of the supply in time of war.

"3. Mercury fulminate, in common with other mercury compounds, is more or less poisonous to the workers handling it, or priming mixtures containing it. This poisoning varies from an itchy skin rash to occasional cases of chronic mercury poisoning with more serious symptoms. This is sometimes a source of trouble in production, causing a large labor turn-over in certain departments. Thus, when we began to use our present noncorrosive rim-fire priming mixture, several hundred people were tried in the rim-fire priming room before a gang which was sufficiently resistant to the poisoning could be collected. Even now there is considerable turn-over of labor on this job.

"4. Mercury fulminate, or the free mercury in it, also attacks brass, and, since ammunition is largely made of brass, this frequently leads to difficulties. The brass primer cups in which a fulminate priming mixture is loaded must be made softer than otherwise desirable in order that the mercury may not make them split; and they are also nickel-plated to assist in preventing this. Whenever a primer explodes while inserting it in a brass cartridge case, mercury is sprayed all over the interior of the case and will so weaken it that it will burst when fired. Consequently, all such shells must be scrapped, and constitute a loss which would not have occurred had not a mercury compound been used in the priming mixture. Whenever primers are tested for sensitiveness when seated in shells these must also be scrapped because of the poisoning of the brass by the mercury. This same poisoning also prevents reloading of fired cartridge cases which would otherwise be possible.

"5. Mercury fulminate gradually decomposes into nonexplosive substances under the action of heat and moisture, and is, therefore, a source of weakness in a primer. Many complaints of misfires in ammunition can be traced to decomposition of the fulminate in the priming mixture. This action of fulminate was well illustrated in the exhibits that Mr. Von Herz brought with him last May.

"6. Mercury fulminate is very violent in its action. This results in such ammunition defects as punctured primers, blown primers, gas escapes around primer pocket, etc.

"7. Mercury fulminate gives off very little heat when it explodes, and adds but little to the heat of a priming mixture."

This memorandum proceeds to point out the advantages of tetracene over mercury fulminate. Parenthetically it should be noted here that the Germans and occasionally Remington use the word "sensol" interchangeably with the word "tetracene." I quote:

"* * * The advantages which sensol would have over mercury fulminate would be:

"1. It can be made from materials which could be available in this country even in wartimes.

"2. It is not believed to attack brass as fulminate does.

"3. German experiments have indicated that sensol-polnol mixtures are extremely stable, while fulminate mixtures are not.

"4. It gives off considerable heat when it burns, and would be a source of heat in a priming mixture."

Not long after this memorandum was written, Remington appears to have definitely concluded that tetracene or sensol was effective as a sensitizer in a priming composition and that its use had none of the disadvantages attendant

Digitized by Google

upon the use of mercury fulminate. Thus United States Patent No. 1,889,116 (exhibit No. 2), issued November 29, 1932, to the Remington Arms Co. reads in part as follows—I quote:

"The present invention comprises the discovery of a highly successful combination of ingredients by the use of which both mercury fulminate and corrosive oxidizers are rendered unnecessary, and the further discovery that the sensitizing function of mercury fulminate is effectively performed by an extremely small quantity of another sensitizer which does not have the disadvantages of mercury fulminate.

"The sensitizing agent utilized in the present invention is selected from the class of compounds known as tetracenes * * *.

On December 20, 1923, the German inventor, Hans Rathburg, filed an application in the United States Patent Office for a patent on priming compositions containing tetracene. The application was granted and United States Patent No. 1,586,380 (exhibit No. 3) issued to Rathburg on May 25, 1926. Rathburg assigned the patent to Rheinisch-Westfaelische Sprengstoff, A. G., a corporation organized under the laws of Germany with its executive offices at Cologne, Germany.

Rheinisch-Westfaelische Sprengstoff, A. G., is a 100-percent-owned subsidiary of Dynamit, A. G., a corporation organized under the laws of Germany with executive offices at Troisdorf, Germany. Dynamit, A. G., in turn is affiliated with the I. G. Farbenindustrie of Germany—under an arrangement whereby the profits of Dynamit, A. G., are turned over to the I. G. Farbenindustrie and the I. G. Farbenindustrie pays an amount to Dynamit, A. G., which permits Dynamit, A. G., to pay a dividend comparable to the dividend paid by the I. G. Farbenindustrie. The I. G. Farbenindustrie has the right at any time to exchange shares of I. G. Farbenindustrie for the shares of Dynamit, A. G. Until shortly after November 26, 1940, a substantial portion of the stock of Dynamit, A. G., was owned by the E. I. du Pont de Nemours & Co. E. I. du Pont de Nemours & Co. also held a stock interest in the I. G. Farbenindustrie.[1]

Pursuant to an application for reissue filed October 18, 1929, United States Patent No. 1,586,380 was reissued by the United States Patent Office in the name of Rheinisch-Westfaelische Sprengstoff, A. G., on December 31, 1929, as Reissue No. 17,540 (exhibit No. 4).

On February 20, 1930, Hans Rathburg and Edmund von Herz, as joint inventors, in collaboration with Remington, filed an application in the United States Patent Office for a patent on priming compositions containing tetracene in extremely low quantities, to wit, in an amount not greater than 4 percent of the priming composition. This application (No. 430,138) was a continuation in part of an earlier application (No. 352,893) filed April 5, 1929. The new application, it was claimed, disclosed the proper and most desirable quantities of tetracene to be used in priming compositions to secure the proper ignition of the powder.

Rathburg and von Herz assigned the application to Rheinisch-Westfaelische Sprengstoff, A. G. The application was granted and United States Patent No. 1,889,116 (exhibit No. 2) was issued on November 29, 1932, to the Remington Arms Co. as assignee of the application from Rheinisch-Westfaelische Sprengstoff, A. G.

RESTRICTIVE PATENT ASSIGNMENTS

By an agreement dated November 14, 1929 (exhibit No. 5), Rheinisch-Westfaelische Sprengstoff, A. G., assigned all the United States patent rights relating to tetracene to the Remington Arms Co. (The patent rights assigned included U. S. Patent No. 1,586,380 issued May 25, 1926, and later reissued as Reissue No. 17,540 on December 31, 1929, and U. S. Application No. 352,893 which later issued on November 29, 1932, after having been continued in part by a new application (No. 340,138), as U. S. Patent No. 1,889,116.) As consideration for the assignment the Remington Arms Co. agreed to pay Rheinisch-Westfaelische Sprengstoff, A. G., $25,000 and agreed to make stipulated additional "royalty" payments to Rheinisch-Westfaelische Sprengstoff, A. G., during the life of the United States patents (these additional payments were designated as "royalty" payments although the patents were assigned to the Remington Arms Co., with full title to, and ownership of, the patents vested in the Remington Arms Co.).

[1] On November 26, 1940, du Pont's executive committee authorized the sale of du Pont's stock interests in Dynamit, A. G., and I. G. Farbenindustrie.

Digitized by Google

At the time of the agreement of November 14, 1929, between Rheinisch-Westfaelische Sprengstoff, A. G., and the Remington Arms Co., Rheinisch-Westfaelische Sprengstoff, A. G., also held the British and Canadian patent rights to tetracene, but Rheinisch-Westfaelische Sprengstoff, A. G., had already agreed to transfer the Canadian patent rights to Canadian Industries, Ltd., a Canadian corporation, and negotiations for the sale of the British patent rights to Imperial Chemical Industries, Ltd., a British corporation, were under way. The agreement of November 14, 1929, between Rheinisch-Westfaelische Sprengstoff, A. G., and Remington provided that the license rights which Remington was to enjoy in Great Britain were to be determined by negotiations between Remington and Imperial Chemical Industries, Ltd., and the license rights which Remington was to enjoy in Canada were to be determined by negotiations between Remington and Canadian Industries, Ltd. Nevertheless, as will be noted shortly, the agreement of November 14, 1929, imposed certain absolute restrictions upon Remington's sales of ammunition in Great Britain and Canada irrespective of the extent of the license rights which Remington might secure from Imperial Chemical Industries, Ltd., and Canadian Industries, Ltd.

The agreement of November 14, 1929, provides for a world-wide division of tetracene primed ammunition markets between Rheinisch-Westfaelische Sprengstoff, A. G., the Remington Arms Co., Imperial Chemical Industries, Ltd., and Canadian Industries, Ltd. For the purposes of the division of markets established by the agreement, the agreement drew a distinction between military and nonmilitary ammunition. Military ammunition was defined as follows (exhibit No. 5, page 6):

"The term 'military ammunition' as used herein is defined as ammunition adapted and intended for use in warfare and shall not include ammunition adapted and intended solely for sporting purposes or target practice which is herein referred to as 'nonmilitary ammunition.'"

As part of the division of territory effected by the agreement, subdivision (d) of the agreement provides as follows:

"(d) REMINGTON shall not sell military ammunition containing any tetracene in Germany and in any or all of the countries comprising the British Empire."

Other cartel provisions are found in section III (a) and section VIII of the agreement. Section III (a) provides as follows:

"(a) REMINGTON shall not sell nonmilitary ammunition containing any tetracene in Germany in excess of a value of $2,000 in any one year, all sales through Gustav Genschow & Co. not being taken into consideration in computing this $2,000 maximum."

Section VIII provides as follows:

"VIII. REMINGTON, as the owner of the United States patents, has the exclusive rights for the United States of America, but it hereby agrees that R. W. S. may import into the United States of America during any calendar year tetracene ammunition having a value not in excess of 30% of the value of the total imports of ammunition into the United States from all sources during the preceding calendar year and that the Imperial Chemical Industries, Ltd., or its subsidiary companies may import annually into the United States of America not more than 500,000 shotgun cartridges and 10,000 metallic cartridges containing priming material covered by any of the United States patents herein involved."

Notwithstanding the fact that the United States tetracene patents were assigned outright to the Remington Arms Co., Rheinisch-Westfaelische Sprengstoff, A. G., retained certain controls over Remington's use of these patents. Thus section IX of the agreement with Rheinisch-Westfaelische Sprengstoff, A. G., restricts Remington's right to grant licenses under these patents as follows:

"IX. Remington shall have the right to license other American manufacturers to manufacture, use and sell nonmilitary ammunition under any of the United States patents or applications involved in this agreement, but only within the United States of America, its territories and possessions."

Section X of the agreement appears to impose the same restriction upon Remington's right to grant licenses with respect to military ammunition, as follows:

"X. Remington shall have the right to license other American manufacturers or the Government of the United States under any of the United States patents or applications involved in this agreement to manufacture, use and sell military ammunition containing tetracene *within the United States, its territories and possessions.* * * *" [Italics supplied.]

Digitized by Google

On January 1, 1934, an agreement (exhibit No. 6) was entered into between Dynamit, A. G., parent corporation of Rheinisch-Westfaelische Sprengstoff, A. G., and the Remington Arms Co. which left the cartel provisions of the November 14, 1929, agreement with Rheinisch-Westfaelische Sprengstoff, A. G., unchanged. Dynamit, A. G., succeeded to the rights of Rheinisch-Westfaelische Sprengstoff, A. G., under the November 14, 1929, agreement. The new agreement of January 1, 1934, amended the definition of military ammunition contained in the 1929 agreement to read as follows:

"'Military ammunition' is defined as ammunition of sizes and types ordinarily used in war and sold directly to or made under a license from Remington by a government actually engaged in war, or storing the ammunition thus made or purchased for the purpose of war. All loose primers sold to the United States Government shall be considered as military ammunition. 'Commercial ammunition' (nonmilitary ammunition) includes all ammunition not coming within the above definition of military ammunition."

There were also modifications of the "royalty" provisions of the 1929 agreement with respect to both nonmilitary and military ammunition.

The new agreement of January 1, 1934, between Remington and Dynamit, A. G., was expressly approved by E. I. du Pont de Nemours & Co., as appears from documents and correspondence from the files of the Remington Arms Co. attached hereto as exhibit No. 7. It will be recalled that du Pont had acquired control of Remington in 1933 and also held a large block of the stock of Dynamit, A. G., and that in addition du Pont had a stock interest in the I. G. Farbenindustrie, A. G., which company controlled Dynamit, A. G.

The British tetracene patents appear to have been assigned by Rheinisch-Westfaelische Sprengstoff, A. G., to Imperial Chemical Industries, Ltd., in the latter part of 1930. In 1931 Imperial Chemical Industries, Ltd., licensed Remington under the British tetracene patents, authorizing Remington to ship ammunition to Great Britain for sale in Great Britain, Northern Ireland, and the Isle of Man (see exhibit No. 8). As consideration for the license Remington agreed to make stipulated royalty payments to Imperial Chemical Industries, Ltd., and in addition Remington agreed not to materially increase its sales force or advertising in Great Britain and "to adhere to existing prices and trading arrangements."

The license from Imperial Chemical Industries, Ltd., did not distinguish between military ammunition and commercial ammunition; hence, insofar as the license from Imperial Chemical Industries, Ltd., is commercial, Remington has authority to sell military ammunition containing tetracene in Great Britain, and the license has been so construed by Remington. Thus an inter-office memorandum prepared by A. J. Greene, head of the Patent Department of the Remington Arms Co., and dated September 27, 1940, reads in part as follows—I quote (exhibit No. 9, page 2):

"Our agreement with I. C. I., which is in the form of several letters summarized in a Memorandum attached to Mr. Norvell's letter of June 24, 1931, permits us to sell 'centerfire ammunition in Great Britain upon the payment to I. C. I. of a royalty of one per cent (1%) of our sales price. The Memorandum does not distinguish between 'military' ammunition and 'commercial' ammunition; hence. we take it that both can be sold, and the royalty rate is the same for both. No royalty on this ammunition is payable to R. W. S. or D. A. G."

Rheinisch-Westfaelische Sprengstoff, A. G., assigned the Canadian tetracene patent rights to Canadian Industries, Ltd., on December 1, 1930. (See exhibit No. 10.) On April 24, 1931, Canadian Industries, Ltd., licensed Remington to sell "nonmilitary ammunition" containing tetracene in Canada. A photostatic copy of the license is attached hereto as exhibit 11. As consideration for the license Remington, in addition to making specified royalty payments, agreed that it would conduct its business in Canada in such a way as to avoid detriment to Canadian Industries, Itd., and would observe stated price and distribution policies (as set forth in a photostatic copy of a summary of the Remington agreement with Canadian Industries, Ltd., from the files of the Remington Arms Co., attached hereto as exhibit No. 12).

It will be noted that although Remington's license from Imperial Chemical Industries, Ltd., authorizes Remington to sell military ammunition containing tetracene in Great Britain, Remington's license from Canadian Industries, Ltd., does not authorize Remington to sell military ammunition containing tetracene in Canada. However, as appears from a letter dated October 29, 1938, written by

Digitized by Google

R. J. McDonald, head of the Patent Department of Canadian Industries, Ltd., to A. J. Greene, head of the Patent Department of the Remington Arms Co., Canadian Industries, Ltd., believes that the Canadian tetracene patent under which Remington is licensed is invalid. I quote (exhibit No. 13):

CANADIAN INDUSTRIES, LIMITED,
October 29th, 1938.

Re: Canadian Patent on Tetracene.

A. J. GREENE, Esq.,
Bridgeport, Connecticut, U. S. A.

DEAR MR. GREENE: Many thanks for your letter of October 24th.

Canadian Patent 297,882 was issued on March 4th, 1930, and will therefore expire on March 4th 1948. Confidentially we consider this patent of little value in Canada since the inventor failed to comply with the requirements of the Canadian Patent Act when he filed the Canadian Application.

Yours very truly,

[S] R. J. McDONALD.
Patent Department.

RJM/EB

As already noted, in 1931 when Canadian Industries, Ltd., licensed Remington under this patent to sell nonmilitary ammunition containing tetracene in Canada, Canadian Industries, Ltd., in addition to exacting royalty payments for the license, required Remington to agree to observe stated price and distribution policies. At this time, in 1931, Canadian Industries, Ltd., was jointly owned by du Pont and Imperial Chemical Industries, Ltd., but du Pont did not acquire control of Remington until 1933. Accordingly, since 1933 there has presumably been no possibility of a serious conflict of interests between Remington and Canadian Industries, Ltd. It is not surprising, therefore, that on October 29, 1938, Canadian Industries, Ltd., should advise Remington that the patent under which Remington had been licensed in 1931 was invalid.

EFFECT OF THE RESTRICTIVE ASSIGNMENTS

In 1940 Remington sold military ammunition containing tetracene to the Union of South Africa and also to the British Purchasing Commission for shipment and use in Great Britain. I quote from exhibit No. 9, a memorandum written on September 27, 1940, by A. J. Greene, head of the patent department of the Remington Arms Co., to R. Batten, of that company, with copies to D. F. Carpenter, vice president and director of manufacture of Remington, and R. D. Jack, assistant treasurer and assistant secretary of Remington:

BRIDGEPORT OFFICE,
September 27, 1940.

To: Mr. R. Batten.
From: Mr. A. J. Greene.
Re: Tetracene primed military ammunition.

In our discussion a few days ago you presented two (2) questions, as follows:

1. We are selling to the Government of the Union of South Africa two million (2,000,000) .38 S. & W. Special cartridges having lead bullets and tetracene priming.

QUESTION: Is this "military ammunition"?

Having given the point rather thorough consideration, I am satisfied that it should be so classified.

Our agreement with R. W. S. (D. A. G.) states:

"'Military ammunition' is defined as ammunition of sizes and types ordinarily used in war and sold directly to ———, a government actually engaged in war or storing the ammunition thus * * * purchased for the purpose of war."

The Union of South Africa is at war, its belligerence having been recognized in at least one proclamation by the President of the United States.

The only possible question could be whether the fact that lead bullets, instead of jacketed bullets, are used takes the cartridges out of the class of "military ammunition." While most modern military cartridges are provided with jacketed bullets, lead bullets still have a limited use, and their existence and arms adapted

Digitized by Google

for them only are discussed in such treatise on the subject as Colonel Hatcher's "Pistols and Revolvers," the British "Textbook of Small Arms, 1929," and the War Department Technical Regulations No. 1350–A, June 1, 1927. We are, moreover, supplying some lead bullet ammunition to the British Purchasing Commission for defense purposes, as more fully discussed below.

2. We are selling to the British Purchasing Commission, for shipment and use in Great Britain, certain revolver cartridges, some of which are provided with lead bullets, and all, as we understand it, containing tetracene priming.

QUESTION: Your question concerns the payment of royalty with respect to this priming.

Our agreement with I. C. I., which is in the form of several letters summarized in a Memorandum attached to Mr. Norvell's letter of June 24, 1931, permits us to sell "centerfire ammunition in Great Britain upon the payment to I. C. I. of a royalty of one percent (1%) of our sales price." The Memorandum does not distinguish between "military" ammunition and "commercial" ammunition; hence, we take it that both can be sold, and the royalty rate is the same for both. No royalty on this ammunition is payable to R. W. S. or D. A. G. (Mr. Dicke's letter of December 4, 1931, to Mr. von Herz.)

It is to be noted that royalties are payable to I. C. I. only on ammunition "for use in Great Britain or Northern Ireland." Should we sell tetracene primod ammunition to the British Purchasing Commission for use elsewhere it would seem the royalty thereon would be payable to the Gorman firm at the rate specified in the agreement (1% unless a lower rate is established by supplemental agreement).

Royalties are payable to I. C. I. until March 18, 1945, the expiration date of their British Patent No. 310,509.

A. J. GREENE, *Patent Attorney.*

AJG/m.

At this time, as this memorandum shows, Remington considered that the sale of military ammunition containing tetracene for shipment to Great Britain was permissible, by virtue of Remington's license from Imperial Chemical Industries, Ltd.

At the time of these sales in 1940 Remington inadvertently overlooked the November 14, 1929, agreement (as modified on January 1, 1934) between Remington and Rheinische-Westfaelische Sprengstoff, A. G., whereby Remington agreed with Rheinisch-Westfaelische Sprengstoff, A. G., that Remington would not sell any military ammunition containing tetracene to any of the countries of the British Empire. However, on January 23, 1941, Mr. A. J. Greene, head of the Remington Patent Department, wrote Mr. D. F. Carpenter, Vice President and Director of Manufacture of the Remington Arms Company, and Mr. W. U. Reisinger, Treasurer and Secretary of Remington, that no further sales of ammunition containing tetracene should be made to the British Purchasing Commission, the Government of the Union of South Africa, or the Government of Canada, because of Remington's agreement with Rheinisch-Westfaelische Sprengstoff, A. G. Mr. Greene's letter reads as follows:

cc. Mr. W. E. Witsil, Mr. R. Batten, Mr. T. F. Werme, Mr. W. U. Reisinger.

BRIDGEPORT OFFICE,
January 23, 1941.

To: Mr. D. F. Carpenter.
From: Mr. A. J. Greene.
Re: Sale of tetracene primed ammunition to the British Purchasing Commission.

The further sale of Tetracene Primed Ammunition to the British Purchasing Commission, or to the Government of The Union of South Africa, or to the Government of Canada, is most undesirable, by reason of our Tetracene Contract with R. W. S.

Article III, Paragraph (d) of the original contract of November 14, 1929, reads as follows:

"Remington shall not sell military ammunition containing any tetracene in Germany and in any or all of the countries in the British Empire."

This paragraph of the contract was affirmed in Article XII of the revision

Digitized by Google

of the original contract made on January 1, 1934. The revised definition of "military ammunition" is as follows:

"'Military ammunition' is defined as ammunition of sizes and types ordinarily used in war and sold directly to ——— a government actually engaged in war or storing the ammunition thus * * * purchased for the purpose of war."

There can be little if any question that pistol and revolver ammunition sold at this time to "His Majesty's Government in the United Kingdom" is "military ammunition" within the above definition; or that such a sale is a sale "in" a country of the British Empire within the intent of Article III (d) of the contract.

We understand that the Process Division have recommended the use of Tetracene priming in certain ammunition to be sold to the British Purchasing Commission. It appears obvious that this should not be done.

A. J. GREENE, *Patent Attorney.*

AJG/m

Mr. Batten:

Pending action on this letter, I suggest you continue the practice outlined in my letter of September 27, 1940.

A. J. G.

A photostatic copy of this letter is attached hereto as exhibit No. 14. That Remington promptly discontinued selling military ammunition containing any tetracene to the countries of the British Empire, in accordance with Mr. Greene's instructions, is evidenced by a memorandum written by T. F. Werme, Engineering Superintendent of the Remington Arms Company, on January 29, 1941, to Mr. D. F. Carpenter, Vice President and Director of Manufacture of Remington, as follows:

cc. W. T. Ashcroft, A. J. Greene, W. E. Witsil, W. U. Reisinger, R. Batten.

JANUARY 29, 1941.

To: D. F. Carpenter.
From: T. F. Werme.
Subject: Sale of tetracene primed ammunition to the British Purchasing Commission.

A few months ago we had an order for 2,500,000 .38 S. & W. 200 grs. Lead Bullet cartridges from South Africa. We were informed that it was to be a commercial cartridge the same as we made for Peters, but these were to be head stamped as for Remington, so it was natural for us to supply them as they were being made, which in this case was with #49–5021 mixture primers (this priming mixture contains Tetracene). We were not aware of the facts pointed out in A. J. Greene's letter to D. F. Carpenter, dated Jan. 23, 1941, that primers containing Tetracene should not be used in military cartridges sold to Germany or any of the British Empire countries.

Since copy of that letter was received, arrangements have been made to supply a non-tetracene mixture in the primers we are to use in a new order for the .38 S. & W. 200 Grs. Lead Bullet cartridges from the British Purchasing Commission.

[s] T. F. WERME, *Engineering Supt.*

TFW: H

A copy of this letter is attached hereto as exhibit No. 15.

In February 1941 a representative of the A. C. Spark Plug Company, which Company had just undertaken to make machine guns for the United States Government, visited Remington Arms Company for the purpose of procuring aid from Remington in the development of a primer for test ammunition used in such guns. (See letter of February 7, 1941, P. B. Rutherford to E. C. Hadley, attached hereto as exhibits No. 16.)

Immediately following this visit to Remington, and on February 10, 1941, Mr. Greene advised the officials of Remington that in the event the use of tetracene was contemplated in the priming composition to be used in the test ammunition, they should remember that under their contract with Rheinisch-Westfaelische Sprengstoff, A. G., tetracene priming could not be used in ammunition sold to the British Government or to any of the countries of the British Empire. Mr. Greene's letter reads as follows:

Digitized by Google

cc: Messrs. D. F. Carpenter, W. T. Ashcroft, J. H. Chasmar, H. R. Dorr, C. M. Holden.

BRIDGEPORT OFFICE,
February 10, 1941.

To: Mr. E. C. Hadley.
From: Mr. A. J. Greene.

Re Tetracene primed military ammunition.

Reference is made to Mr. Rutherford's letter received by us February 7th, Subject: "Visit to Remington Arms Company of Mr. Fitzgerald, A. C. Spark Plug Company." This letter indicates that the use of non-corrosive priming for test ammunition may receive serious consideration, the object being to eliminate the work and expense of barrel cleaning after tests with chlorate primed ammunition.

In the event that the use of *tetracene* in such noncorrosive priming is contemplated, attention is invited to the following requirements of our tetracene contract with R. W. S.:

1. Tetracene priming cannot be used in ammunition sold to the British Government or to any of the countries of the British Empire.

2. With respect to sales of tetracene primed military ammunition, we pay a royalty of one percent of our net selling price, and the royalties thus paid are not included in the maximum of $250,000, which is payable with respect to commercial ammunition.

A. J. GREENE, *Patent Attorney.*

cc: D. F. Carpenter, W. T. Ashcroft, J. H. Chasmar, H. R. Dorr, C. M. Holden.
AJG/hb

A copy of this letter is attached hereto as exhibit No. 17.

As appears from a letter written by Mr. A. A. Dicke, former vice president of the Remington Arms Co., on July 2, 1931 (exhibit No. 18), Remington has concluded that its contract with Rheinisch-Westfaelische Sprengstoff, A. G., precludes Remington from selling any military ammunition containing tetracene in the Irish Free State even though no patents with respect to tetracene have been issued in the Irish Free State. I quote from this letter:

NEW YORK OFFICE,
July 2, 1931.

Mr. F. J. MONOGHAN,
29 Warren Street., New York, N. Y.:

This is in answer to your telephone inquiry as to our right to selling tetracene primed ammunition in the Irish Free State.

There is no patent for tetracene in the Irish Free State and we think it is too late for a patent to be secured there. However, our contract with R. W. S. dated November 14, 1929, includes the following provisions as paragraph III:

"(d) REMINGTON shall not sell military ammunition containing any tetracene in Germany and in any or all of the countries comprising the British Empire."

My connclusion is that this provision precludes our selling tetracene primed military ammunition in the Irish Free State.

A. A. DICKE, *Vice President.*

AAD/g

Although Remington is obligated by its agreement with Rheinisch-Westfaelische Sprengstoff, A. G., not to sell military ammunition containing tetracene in any of the countries of the British Empire, this restriction does not apply to nonmilitary ammunition. Accordingly, Remington has regularly sold nonmilitary ammunition containing tetracene in England and Canada, as appears from Remington's "royalty" statements attached hereto as Exhibit 19. "Royalties" on sales of nonmilitary ammunition containing tetracene in Canada were paid by Remington to Rheinisch-Westfaelische Sprengstaff, A. G., for the benefit of Canadian Industries, Ltd., but "royalties" on the sale of nonmilitary ammunition containing tetracene in England were paid by Remington direct to Imperial Chemical Industries, Ltd. Presumably, this nonmilitary ammunition containing tetracene was used for shooting grouse, quail, ducks, and for target practice. But Remington may not sell ammunition containing tetracent to Great Britain for the purpose of shooting Germans. Such sales are verboten by the agreement with Rheinisch-Westfaelische Sprengstoff, A. G.

Digitized by Google

Although Remington is obligated by its agreement with Rheinisch-Westfaelische Sprongstoff, A. G., not to sell military ammunition containing tetracene in various other Europen and Asiatic countries, including Italy and Japan.

Remington's authority to sell military ammunition containing tetracene in Holland, Switzerland, Austria, Hungary, Czechoslovakia, Sweden, Spain, Rumania, and Italy is discussed in correspondence between Remington and Edmund von Herz of Rheinisch-Westfaelische Sprengstoff, A. G., in 1930. Mr. von Herz wrote Mr. Dicke, former vice president of Remington, under date of June 26, 1940, as per exhibit No. 20 attached hereto. I quote from a translation made by the Department of Justice:

KOELN-DELLBRUECK, *June 26, 1930.*

Vice President A. A. DICKE,
Remington Arms Company, New York.

MY DEAR MR. DICKE: In view of the fact that we have already equipped a major part of our munitions with the new sensol-polnol priming mixtures and since towards the end of the year, after completion of the new Polnol plant at Stadeln, our entire munitions is going to be equipped therewith, I believe the time has come to start large-scale advertising of these priming mixtures for military uses. I expect to take charge of this field myself and I intend to consider at first several smaller self-sufficient European countries. I am thinking particularly of Holland, Switzerland, Austria, Hungary, Czechoslovakia, Sweden, Spain, and perhaps Rumania and Italy. I wanted to give you notice of my intentions in view of our agreement and would like to inquire whether your firm is interested in any way in the military business in those states as far as past deliveries of military munitions is concerned. Since all of the aforementioned states are presently self-sufficient, I doubt whether there is any hope for any deliveries. However, I wanted to notify you any way of the steps which I hope to take.

EDMUND VON HERZ.

Mr. Dicke replied by letter dated July 8, 1930, as per exhibit No. 21 attached hereto. I quote (as pointed out above, the Germans use the word "sensol" interchangeably with the word "tetracene"):

JULY 8TH, 1930.

Mr. EDMUND VON HERZ,
Koln-Dellbruck, Eschenbruchstrasse 80, Germany.

DEAR MR. VON HERZ: We have your letter of June 26th relative to Sensol-Polnol priming mixtures for military purposes and note that you are about to begin active propaganda for the popularization of these mixtures for military purposes in various European countries, especially Holland, Switzerland, Austria, Hungary, Czecho Slovakia, Sweden, Spain, and eventually also Roumania and Italy.

We have not sold any military ammunition to the Governments of any of these countries in a long time, if ever, and there is very little prospect that we will be able to do so except for the remote contingency of a major war, in which event, any of these countries might come to us for a part of its ammunition supply. Under our contract we have the right to sell military ammunition in any of the countries mentioned and we are, of course, not prepared to waive that right although we think the chances of making any sales are very remote.

Mr. Monaghan makes the request that in any arrangement you make with the Governments of any of these countries you provide against the export of Sensol-Polnol ammunition. Later, some of these countries might have surplus or obsolete ammunition which they would want to sell in some other country, such as a South American country, which sale would be in competition with us as well as yourselves. We hope you will not make any effort to interest the arsenals of South American countries as in many instances they also produce commercial ammunition which would be sold in competition with us: Furthermore, you will probably have to give full technical information to the Governments interested with the result that it might be used against all of us commercially.

We hope that these observations will be of value to you in the undertaking you have in mind.

Very truly yours,

A. A. DICKE, *Vice President.*

AAD/c.
CC—Mr. S. Norvell, Mr. F. J. Monaghan, Col. L. J. Hermann.

Digitized by Google

Although the agreement of November 14, 1929, between Rheinisch-Westfaelische Sprengstoff, A. G., and Remington obligates Remington not to sell miltary ammunition containing tetracene to any of the countries of the British Empire, the cartel provisions of the agreement as a whole are distinctly advantageous to Remington, for these provisions assure Remington of a monopoly of the domestic market for ammunition primed with tetracene. By reason of the November 14, 1929, agreement, in the early part of 1939 Remington was able to induce Rheinisch-Westfaelische Sprengstoff, A. G., to discontinue the shipment of primers containing tetracene to this country. The primers in question were a specialty for which Rheinisch-Westfaelische Sprengstoff, A. G., had no other use, but Remington found that their sale to police departments in this country broke Remington's market price for such primers. The complete story is told in a series of letters between Rheinisch-Westfaelische Sprengstoff, A. G., and Remington, attached hereto as exhibit No. 22. I quote from these letters:

CC—B. E. Strader, C. B. Wells, A. E. Buchanan, A. J. Greene.

BRIDGEPORT, CONN., *Feb. 8, 1939.*

To: E. C. Hadley,
From: R. C. Swan,
Subject: German primers.

The volume of German pistol primers being imported by the Pacific Gun Sight Company, San Francsco, Calif., has become quite disturbing. These are being offered at a very low price to the trade and to police departments.

I am not certain whether their price direct to police departments is the same as to dealers—namely, $2.50 per thousand, but I think it is. This price has forced us to reduce our prices on components. For a comparable primer, the list price was reduced from $4.00 to $3.80 per thousand and the discounts increased from 25–10–5% to 35–15–5%. As applied to this particular primer, our net return has been reduced from $2.57 per thousand to $1.89 per thousand or a reduction of 26.3%.

It is noted that these are brass primers which suggests the probability that the mixture is non-mercuric. Possibly they are obtained from R. W. S. or D. W. M. (Germany) or in some other way there may be an infringement of our patented priming.

Mr. Greene's attention is also called to the microscopic word "Germany" on the label with the suggestion that he investigate whether our import laws require "made in Germany" and whether the manufacturer's name must also appear.

To date several million of these primers have been imported thereby affecting our sale of components and, of even greater importance, our loaded cartridges.

Please keep us posted on your findings.

[A] R. C. SWAN.

BRIDGEPORT, CONN., *March 28, 1939.*

To: J. C. Heath.
From: R. C. Swan.

Thanks very much for your assistance in regard to primers being imported at San Francisco.

I believe I have already told you confidentially that the mixture is a definite infringement on our patents. Through our Legal Division here the matter has been taken up with certain parties in Germany, but that has not been sufficient time to hear from them. If we can block this without showing our hand to anyone in this country you will agree that it is most desirable. I'll keep you posted on developments.

RCS/Hu

[S] R. C. SWAN.

RHEINISCH-WESTFAELISCHE SPRENGSTOFF-ACTIEN-GESELLSCHAFT,
Nürnberg, Germany, March 15, 1939.

Subject: Shipment of Sinoxid Primers to U. S. A.

REMINGTON ARMS CO., INC.,
Bridgeport, Conn.:

We wish to acknowledge receipt of your letter of the first of this month, and can say in reply that the primers mentioned by you were of D. A. G. make, and were furnished by us to a concern in San Francisco.

The first shipments were in 1938, and consisted of 2 million primers; this year we have already shipped 200,000. A further order of 500,000 has been manufactured, and is now ready for shipment.

As these primers are a specialty for which we have no other use, we would like to ask you to agree to permitting the shipment of this small order. There will be no repetition of these unimportant shipments if you consider this necessary in the protection of your interests.

In this connection we would like to point out that we have made almost no shipments to the United States for years. When we had inquiries last year for these primers, it completely escaped our attention that such shipments to the United States could not be made because of the terms of our agreement with you on tetracene priming compositions. We also have a similar agreement with England, which does not, however, exclude shipments on our part.

In any case, we would like to beg your pardon for the oversight. We are also ready to make you the proper payment for the shipments made by us.

With regard to the shipment of the 500,000 primers which we now have ready to go forward, we would ask that you let us know of your decision concerning them.

Very truly yours,

RHEINISCH-WESTFAELISCHE SPRENGSTOFF-
ACTIEN-GESELLSCHAFT,

VOSS.

Re: Shipment of sinoxid primers to U. S. A.

APRIL 6, 1939.

DYNAMIT-ACTIEN-GESELLSCHAFT,
Nürnberg, Germany.

GENTLEMEN: We have your letter of March 15th in the above matter, and note that the primers which have been on sale by the Pacific Gun Sight Corporation during the last year were actually secured direct from you.

We greatly appreciate your courtesy in promptly advising us of this fact, and your further courtesy in offering to discontinue further shipment. It is quite desirable from our standpoint that you do so. The effect upon the trade of having tetracene primers available through any other source than Remington is most undesirable. We note that you have on hand about five hundred thousand (500,000) primers which you would like to ship to the United States, chiefly for the reason that you have no other use whatever for them. This will be quite satisfactory to us, and any claim for damages which we might have due to past shipments, is hereby waived.

Digitized by Google

We are greatly pleased to have the entire matter terminated in this satisfactory manner.

Very truly yours,

AJG/m

A, J. GREENE,
Patent Attorney.

c—Mr. R. C. Swan, Mr. D. F. Carpenter, Mr. W. O. Stauffer, Mr. J. G. Heath. (See note attached.)

The January 1, 1934, amendment of the November 14, 1929, agreement between Rheinisch-Westfaelische Sprengstoff, A. G., and Remington provides that the maximum total amount of "royalties" to be paid by Remington on sales of nonmilitary ammunition containing tetracene shall be $250,000. Apparently payment of the full $250,000 has been completed or will be completed by Remington before the end of this year, as appears from a document from the files of Remington attached hereto as exhibit No. 23.

The agreement of November 14, 1929, between Rheinisch-Westfaelische Sprengstoff, A. G., and Remington (as modified by the January 1, 1934, agreement between Dynamit, A. G., and Remington which was approved by duPont) did not provide for any maximum on the total amount of "royalties" to be paid by Remington on the sale of military ammunition containing tetracene or on licenses by Remington to the United States Government or other manufacturers for the production of military ammunition containing tetracene. Hence under the agreement "royalties" on the sale of military ammunition containing tetracene or on licenses by Remington to produce military ammunition containing tetracene are payable by Remington for the duration of the patents. The "royalty" provisions with respect to military ammunition are summarized in a memorandum of the Remington Arms Company dated August 26, 1935, attached hereto as exhibit No. 24. I quote:

BRIDGEPORT OFFICE,
August 26, 1935.

To: Mr. E. E. Handy,
From: Mr. A. J. Greene, attorney.
Re: D. A. G. royalties on military ammunition.

This is in response to your request for a summary of the provisions of the tetracene contract in regard to the royalties payable on military ammunition manufactured by the United States Government under license from Remington.

The pertinent part of the contract reads as follows:

"Remington shall not, without the consent of D. A. G., license the Government of the United States or other American manufacturer to manufacture and/or sell military ammunition coming within the terms of this agreement at a royalty less than the following: (a) for cartridges, Fifteen Cents ($0.15) per thousand; (b) for primers and empty primed shells, 1 percent of Remington's net selling price of similar military primers and primed empty shells. The consent of D. A. G. to licenses at a less royalty, when necessary to the granting of profitable licenses, will not be unreasonably withheld.

One-quarter (¼) of the royalty received by Remington from the Government of the United States or other licensee with respect to military ammunition shall be paid to D. A. G.

Strictly construing the language of the contract, Remington would not be entitled to license the United States Government at all (at a rate less than $0.15 per thousand cartridges) without the consent of D. A. G. If a license at a lesser rate or a free license were granted D. A. G. would seem to be entitled to receive from Remington one-fourth (¼) of the specified rate of $0.15 per thousand ($0.0375 per thousand on the entire Government production). This would necessitate securing regular reports of Government production and a free contribution by Remington to D. A. G. of $0.0375 per thousand on such production. The same rates apply if Remington licenses another American manufacturer for military production.

The rate of royalty to be paid by Remington on its own production of military ammunition is 1% but, if necessary for the securing of substantial sales, this rate may be reduced to not less than 1/10 of 1%. The 1% rate seems to be entirely out of proportion to the $0.0375 per thousand rate payable by Remington on its license to others.

A. J. GREENE, *Attorney.*

AJG/m

Digitized by Google

These provisions of course would be very significant in the event the United States Army should adopt tetracene priming for general military use, as appears from a memorandum written by A. J. Greene of the Remington Arms Co., dated May 23, 1941, attached hereto as exhibit No. 25. I quote:

* * * * * * *

"Remington may license the United States Government and other American manufacturers at a royalty of fifteen cents (15¢) per thousand (1,000) cartridges and one per cent (1%) of Remington's selling price of primers. D. A. G. may consent to lesser royalty. One-fourth (¼) of the royalties received by Remington under such licenses are payable to D. A. G.

"The above rates are reduced to one-half (½) after May 25, 1943, and continue at the one-half (½) rate until November 29, 1949, unless the tetracene content exceeds four per cent (4%) of the mixture, in which event no royalties are payable after May 25, 1943.

"Attention is particularly invited to the provisions with respect to royalties on production by the United States Government or American manufacturers other than Remington. These provisions should be brought to the attention of the Ordnance Department for their consideration in determining the desirability of adopting tetracene priming for general use, and before further royalty payments to D. A. G. or its subsidiary we should obtain the approval of the United States Department of Justice."

The so-called "royalties" payable by Remington under the agreement with Rheinisch-Westfaelische Sprengstoff, A. G., with respect to both military and non-military ammunition, are in fact payments of the purchase price of the patents. As already pointed out, Remington is not licensed under the United States tetracene patents but actually owns and has full title to these patents. Recognition of this fact appears in a memorandum written by A. J. Greene, of the Remington Arms Co. dated December 10, 1940, attached hereto as exhibit No. 26. I quote:

BRIDGEPORT, CONN., *December 10, 1940.*

To: Mr. Thomas A. Wilson.
From: Mr. A. J. Greene.
Re: Patent licenses.

Reference is made to your letter of December 5. Your request is in two parts:

1. *A list of all United States patents licensed to Remington from foreign owners.*

Remington has no licenses under patents owned by or issued to any foreign persons, firms, or corporations. However, Remington pays royalties to Rheinisch-Westfaelische Sprengstoff, A. G., Nurnberg, Germany, under two patents *purchased* from them some years ago. These patents relate to Tetracene Priming for ammunition. They are Rathsburg, Re-Issue No. 17,540, Dec. 31, 1929 (Original No. 1,586,380, May 25, 1926); Von Herz & Rathsburg, No. 1,889,116, Nov. 29, 1932.

The royalties paid this year will be of the order of Twenty-Five Thousand Dollars ($25,000). The contract provides for a maximum royalty for commercial ammunition which will be reached some time next year. As to military ammunition, royalties are payable until the expiration of the patents, there being no maximum.

* * * * * * *

CONCLUSION

Remington's faithful adherence in 1941 to its agreement with Rheinisch-Westfaelische Sprengstoff, A. G., not to sell military ammunition containing tetracene to the countries of the British Empire may readily be understood when the close commercial relationships that have existed between the two companies are borne in mind. The intimate character of these relationships is set forth in a letter written by A. A. Dicke, former vice president of the Remington Arms Co., on May 13, 1929, to Mr. Norvell, then president of the Remington Arms Co. A copy of this letter is attached hereto as exhibit 27. At the time this letter was written Mr. Dicke was at Cologne, Germany, engaged in negotiating the tetracene cartel agreement with Rheinisch-Westfaelische Sprengstoff, A. G. I quote from Mr. Dicke's letter:

COLOGNE, GERMANY, *Monday, May 13, 1929.*

DEAR MR. NORVELL: I have been wanting to write you for some days, but it has simply been impossible. We have been entertained to the limit. The little time we were left alone was urgently needed for sleep—and little enough of that.

We arrived here from London Sunday, May 5th. We were met at the station by Mr. and Mrs. von Herz and also by Mr. and Mrs. Axelrath, who made a special

Digitized by Google

trip down here from Hamburg. They took us motoring in the afternoon, and in the evening we all had dinner at the home of Mr. & Mrs. von Herz.

The next morning (Monday) we had a short meeting with Dr. Muller, president of the R. W. S. and allied companies. He invited Mr. Monaghan, Mr. von Herz, and myself to dinner at his home that evening. That certainly was a treat. You can imagine the rare wines, champagnes, foods, etc., not to mention some 1828 Cognac which was used to drink a special toast to the friendship of the two companies and to the success of our plans for cooperation to mutual benefits.

Dr. Muller is about 50 and is a large owner in the business. The Mr. Schmidt who was in America lately to organize the American associate of the I. G. chemical trust is his brother-in-law. I think Mr. C. E. Nu is in that project. Dr. Muller also is friendly with Dr. Mites. He is also well acquainted with the Duponts, who usually stay at his home here when they are in Cologne. He is also close to your friend, Sir Harry McGowan, of the I. C. I. He recently invited the Mullers to the forthcoming marriage of his daughter. I am merely mentioning this to give you some idea of his standing here and elsewhere. He is the moving spirit in the cartridge-company mergers here, as well as the explosive and detonator company mergers, and he told us of his plans for an early merger of the German celluloid companies, which will be the forerunner of a European combine.

His reception of our general suggestions on commercial cooperation was most enthusiastic. We told him of our hopes of doing something, but pointed out the difficulty of doing anything much without the cooperation of other American manufacturers, and particularly the French and Belgians. He acknowledged the difficulties, but made suggestions which to me seemed to be an answer to the difficulties. The whole thing is too long and too complicated to expound in this letter, but we discussed such questions as understandings on prices, interchange of credit information, discouragement of local factories in our export markets, cooperative opposition to high tariffs in export countries, cooperation in securing removal of restrictions against arms and ammunitions, etc.

That afternoon we had visited their detonator plant at Troisdorf, where we were entertained at luncheon at the employees' clubhouse—which, incidentally, is a wonderful place. It is like a very large residence with furnishings such as one would expect to find in the finest homes. The Troisdorf plant, as well as the one in Nurnberg and at Stadeler (now Nurnberg), are beautifully laid out. The gardens resemble a park with trees, shrubs, and lawns. Most of the factory buildings are one story, well constructed, and well lighted. We were very much impressed with the offices of the various executives. Even the minor executives have excellent offices. For example, Dr. Rathsburg, whose position corresponds to that of our Dr. Hutchinson, has an office about 3 times the size of Mr. Strugnell's, with rugs on the floor, curtains at the windows, and every possible convenience, whereas Dr. Hutchinson and his corps of chemists are housed in a low building with a flat roof, where the temperature in summer is unbearable, with R. R. engines outside belching smoke and dirt, and, to make matters worse, prime drop testing is done a few steps away in the same building, making thousands of sharp, violent reports each day. To make matters still worse they have the pattern shop in the same building. When I see how such things are done here I wonder how we can expect scientists to do research work under such conditions. The best men could not accomplish anything even if they would stay long enough to get started.

As far as my own office in N. Y. is concerned, I haven't seen anything like it here.

I have arranged for a photograph of the laboratory which will show the general lay-out.

What I have seen here strengthens the view I have always held that we do not do enough research and development, especially in Bridgeport. "Penny wise and pound foolish" I often think.

On Tuesday we went to Nurnberg (8 hours on best train)—von Herz went with us. Here we were received by Mr. Voss, the new director of the ammunition division, Mr. Lesissler, chief engineer, whom you met with Mr. Herz in N. Y. The next day Mr. Karl Genchow, head of the old Genchow arms & ammunition organization (now affiliated with R. W. S.), and his export manager, Dr. Seebach, came to Nurnberg to meet us. On Thursday morning we had a general talk, and then, it being a holiday, they took us to Rothenburg, which city you have probably seen. The rest of the week was devoted to sales questions, tests of tetracene-ponol primed ammunition, and seeing their plants. The tests impressed me very much. I sent details of new mixtures to Bridge-

Digitized by Google

port by week-end cable. I saw the entire operation and the tests, and I am sure Bpt. will get the same good results if no personal predilections are allowed to come in.

As to technical matter, I expect soon to write to Col. Hermann, but I do want to say this much: I have now seen Nobels plant and R. W. S.'s, and their equipment is fully up to ours, if not some better. We really have little or nothing to feel puffed up about, and we can learn something from them. Their low mfg. costs are not due merely to low labor costs (probably 60% of ours when insurance, etc., is included), but to the use of equipment fully as good as ours. Both Nobels & R. W. S. are working on quality and we will have to improve ours if we want to hold our own.

In the talks on sales matters it has developed that Genchow may want to handle our air rifle, our Model 11 shotgun (F. N. can not make deliveries on account of military work), and other items. They have given us information on available orders for military ammunition. We will take this up with Rugge. Will write more soon.

[Henday.]

A. A. DICKE.

P. S.—Tuesday, May 14. I was so sleepy last evening I had to close and go to bed. Now I will continue. We returned here (Cologne) from Nurnberg yesterday. Will have a meeting here today with R. W. S and 3 men from Nobels. Laing will speak also for Dominion. * * * We picked up many little bits of valuable information here. I am more than ever convinced that we shou'd work more closely with our competitors here. There is as much reason for being personally acquainted with our competitors in our world markets as that we know our U. S. competitors.

Nobels and also Dr. Muller seem to know a great deal about Western—some of which information may have come from Dupont. They seem to think that Western wants to be bought up and that their actions are designed to increase their nuisance value. Muller said that he thought we could all save money if we bought them up. I told him we could not do so on account of the Sherman Law and he offered to do it for us. These thoughts are passed on to you for what they may be worth. They may fit in with other information you have on hand. Western's price-cut is costing us about $1,000,000 a year, which is the interest at 6% on $16,000,000.

I think I am "sitting pretty" in the meeting today. We hold the option on tetracene which includes *exclusive* rights for *military* in all American countries except Canada. Nobels wants military rights in S. American and so does R. W. S. if and when the provisions of the Versailles treaty are relaxed. I expect to trade this for rights in England and Canada and possibly get a royalty on military sales in Mexico & S. A. countries.

Well, I must close, as Mr. von Herz has arrived. By the way, I spoke to him about the matter which arose between Dominion and us over polnol. He explained the situation to my entire satisfaction. It was a misunderstanding committed by Mr. Eslhbach, one of the other R. W. S. men. So long—

A. A. D.

The advantages of tetracene have already been pointed out. Remington recognizes these advantages. The fact that the Process Division of Remington recommended that tretracene be used in certain ammunition sold to the British Purchasing Commission is evidenced by exhibit No. 14, already submitted, wherein Mr. Greene stated:

"We understand that the Process Division have recommended the use of tetracene priming in certain ammunition to be sold to the British Purchasing Commission. It appears obvious that this should not be done."

The dollar value of ammunition containing tetracene sold by Remington increased from approximately $325,000 for the 3-month period January 1, 1934, to March 31, 1934, to $3,550,000 for the 3-month period April 1, 1941, to June 30, 1941 (from exhibit No. 28, compiled from exhibit No. 19).

Remington's "royalties" payable to Rheinisch-Westfaelische Sprengstoff, A. G., on the sale of ammunition containing tetracene increased from approximately $3,000 for the 3-month period January 1 to March 31, 1934, to $13,000 for the 3 month period October 1 to December 31, 1940 (from exhibit No. 29, compiled from exhibit No. 19).

To summarize, the patents in Great Britain relating to tetracene are owned by Imperial Chemical Industries, Ltd., and Remington has a license under these patents from Imperial Chemical Industries, Ltd., which is broad enough to permit

Digitized by Google

Remington to sell military ammunition containing tetracene in Great Britain. In Canada the principal patent relating to tetracene is owned by Canadian Idustries, Ltd., and Remington has a license under this patent from Canadian Industries, Ltd., which permits Remington to sell nonmilitary ammunition containing tetracene in Canada but which does not permit Remington to sell military ammunition containing tetracene in Canada. However, Canadian Industries, Ltd., has indicated that the patent under which this license was granted is invalid. In the Irish Free State no patents relating to tetracene have been issued. I do not know the patent status of tetracene in other countries of the British Empire, including the Union of South Africa, India, and Australia.

Notwithstanding the above, Remington is prohibited by its agreement with Rheinisch-Westfaelische Sprengstoff, A. G., from selling military ammunition containing tetracene to Great Britain, the Irish Free State, Canada, the Union of South Africa, India, Australia, and the other countries of the British Empire, and is also prohibited by its agreement wtih Rheinisch-Westfaelische Sprengstoff, A. G., from licensing other American manufacturers to sell ammunition containing tetracene to these countries.

In fairness to Remington it should be stated that upon the basis of information submitted to us within the past few days by counsel for Remington and upon the basis of information recently submitted by an employee of the British Purchasing Commission at the request of Remington, we do not believe that Remington's agreement with Rheinisch-Westfaelische Sprengstoff, A. G., not to sell military ammunition containing tetracene to the countries of the British Empire has in fact operated to date as a serious impediment to the Allied war effort. We shall not go into the details of the information submitted by Remington for we feel sure that Remington will wish to make its own explanations to this committee. We do believe that Remington's agreement with Rheinisch-Westfaelische Sprengstoff, A. G., demonstrates with striking and dramatic clarity the potential serious danger at this time of private cartel agreements with the I. G. Farbenindustrio and its affiliates. As Mr. Arnold has previously indicated, we believe that some legislative provision should be made for compulsory registration of all such agreements in order that they may be scanned by public authority at the present time in the light of present conditions. We do not believe that the discovery of these agreements should be left to chance. Economic alliances with the I. G. Farbenindustrio must not be permitted to handicap American industry in producing or distributing the tools of war.

EXHIBIT No. 130

MAGNESIUM

Statement by Monroe Karasik

The story of magnesium in America offers an excellent example of how complete a control over a common natural resource may be exercised through a concentration of patents. Although the sources of magnesium are virtually unlimited, since it may be extracted from sea water or from ores which are abundant and easily accessible, one company has monopolized its production in the United States between 1927 and 1941. Moreover, a German company through a patent-pooling arrangement, has held the right to limit the production of magnesium in the United States while Germany was steadily expanding her production.

DESCRIPTION AND BACKGROUND

Magnesium is of vital importance today because it is a light yet strong metal which has many war uses. One-third lighter than an equal volume of aluminum, it is the lightest metal which has physical properties adequate for structural purposes, though to be structurally useful it must be alloyed with other metals. It is easy to work hot or cold, to machine, and to weld electrically. Because of these qualities it is invaluable for parts for aircraft engines and bodies. Magnesium casing on aerial bombs means less weight and therefore more bombs per plane. Since magnesium in certain forms burns well, it is the ideal material for incendiary bombs. As magnesium burns, it gives forth an intense white light, thus making it useful in flares and in starshells. Moreover it is used in portable tools, and in parts of machinery.

According to the Bureau of Mines' estimates of the world production of magnesium, German production increased from 12,080 metric tons in 1937 to 19,000

Digitized by Google

tons in 1940, while the production in the United States amounted to 2,059 tons in 1937, and 5,680 tons in 1940. Germany produced 61 percent of the world production of magnesium in 1937 while the United States produced 10 percent. Even in 1940, the year which saw the fall of France, Germany was still producing almost one half of the world's production while the United States was producing but 14 percent.

It has been estimated that the aircraft industry used about 80 percent of the magnesium alloys produced in the United States in 1939 and 1940. Of this, about 60 percent was in construction of the engine, and the remainder in airframe and wheels. Magnesium-alloy sheet was produced for the first time in 1939 for such interior parts of airplanes as walls, floors, seat and berth members, partitions, doors, and other secondary structures. The more important of the other industries using magnesium alloys are the automobile, the portable and high-speed equipment, the tool, and the textile industries. In general magnesium is employed for similar uses abroad. The aircraft industry takes most of the metal. However, in Germany, and perhaps in Japan, it has been substituted for other metals in a number of uses. Recent German uses for magnesium are reported to include telephone switch parts, bus bars, aerial bombs, engraving plates, and instruments.

Magnesium metal was first produced commercially in the United States in 1915. Before that Germany supplied practically all of the world's requirements. By 1918, at least eight enterprises had undertaken magnesium production in the United States, spurred on by the ready availability of raw materials and the price of $5 per pound for the metal. One of these companies was the American Magnesium Corporation which became a subsidiary of the Aluminum Co. of America in 1919. By 1920, through consolidation or elimination, there were only two companies producing: the Aluminum Co., or Alcoa, and the Dow Chemical Co. From 1920 to 1927 these two companies, in no way dependent upon each other—either for raw material, for patent privileges, or for outlets for products—continued to produce magnesium. The total output tripled, and the price fell from $1.60 in 1920 to 55 cents per pound in 1927.

Magnesium chloride, the raw material used by the Dow Chemical Co., was a byproduct in the process by which Dow obtained certain chemical products for which its business was originally founded. In fact, the magnesium chloride had actually to be disposed of at a substantial loss, if it were not processed for the production of magnesium metal, in order to avoid contamination of the water supply of cities near Dow's plant at Midland, Mich. The Dow process electrolyzed the magnesium chloride obtained from underground brines. The Alcoa-owned American Magnesium Corporation used magnesite ores as a raw material.

EARLY DOW-ALCOA RELATIONS

The competitive struggle between the two companies was apparently hard on both of them, and in 1927 the American Magnesium Corporation discontinued the production of magnesium and thereafter purchased the metal it needed from Dow. It is interesting to see how this arrangement came about.

It must be remembered that Alcoa had a huge investment in plant and equipment in the aluminum alloys business which stood to suffer from a substantial expansion of the use of magnesium-alloy products. If substitution of magnesium for aluminum were inevitable, then Alcoa wanted to provide the substitute, but it obviously had no such eager interest in stimulating the demand for new uses for magnesium-alloy products as did Dow.

In 1926, the Dow Co., trying to expand the use of the metal, progressively reduced the price per pound from around 90 cents to between 55 and 60 cents. Alcoa was then faced with strong domestic competition, and it was beginning to fear foreign competition from Germany. A memorandum dated December 16, 1926 (exhibit No. 1), written by the superintendent of Alcoa's magnesium operations, Mr. H. E. Bakken, stated the problem as follows:

"* * * a magnesium business can be maintained and a foot in the door be kept by the Aluminum Company of America against the future without loss to the Aluminum Company of America. Should the future change the present aspect of magnesium insofar as the aluminum vs. magnesium situation is concerned, then a very favorable position could have been maintained without loss to the Aluminum Company of America.

"If we purchase metal from Dow, we presumably would eventually obtain an exclusive contract. In such an event we would remove from the present American market the price-cutting competition. On the other hand, we will sooner or

Digitized by Google

later have to face competition from abroad either by direct imports or by manufacture in this country.

"Prices in Germany at the moment are alleged to be on the same volume basis as aluminum. If such a price condition should obtain in this country, our position with the Dow Company in a combination might be a serious handicap because of two companies striving to profit from a small-profit business. On the other hand, it might result in a great advantage."

After deciding that Dow's cost of production was lower than its own, the Alcoa-owned American Magnesium Corporation, or A. M. C., approved Bakken's suggestion that "Metal can * * * be bought at such a schedule of prices based on yearly tonnage that we could as a selling and fabricating company resell ingot and fabricate without domestic competition" (exhibit No. 2). At sometime during the late summer of 1927, it entered into what S. K. Colby, A. M. C. official, called an "arrangement," and what Arthur V. Davis, chairman of the Board of Alcoa, called a "scheme" with Dow, whereby it purchased all its requirements of magnesium from Dow, and at a preferential price (exhibits Nos. 3 and 4).

It should be noted that although A. M. C. ceased production at this time, it continued to fabricate magnesium. At the same time that the purchase agreement was signed, Dow and A. M. C. entered into a cross-license agreement concerning certain patents which each owned. By the terms of this agreement, A. M. C. could use Dow patents only on metal supplied by Dow, and some restrictions were placed on Dow with respect to its operations in the fabricating field. Whether these restrictions applied to its price policy or its output policy, or to both, is uncertain. A. M. C. was also free to import metal.

Meanwhile, the German interest in the American magnesium market was being revived. Some time in 1928 or 1929, I. G. Farbenindustrie, the great German dye-trust, and producer of magnesium, effected contact with Alcoa, and by January 18, 1929, S. K. Colby, writing to vom Rath of American I. G., (I. G. Farbenindustrie's American offspring, now known as General Aniline and Film Corporation) was able to summarize their discussions in the following manner:

"Confirming our several conversations regarding the desirability of an entente cordiale between our respective companies, but more particularly referring to the possibility of a mutual interest in the manufacture of metallic magnesium to which the Dow Chemical Company of Midland, Mich., must be a party * * *" (exhibit No. 5).

Arrangements were made to have an independent engineer examine the production methods of both Dow and I. G., in order to determine the difference in cost of production if the I. G. process were used in the United States.

The report of this independent expert showed that there was a reasonable probability that the I. G. process could be commercially used in the United States (exhibit No. 6). When Dow and Alcoa representatives met in Detroit on or about December 19, 1929, according to Bakken's memorandum of that date (exhibit No. 7) to discuss that report, Dow was quite loath to enter into any relationship with I. G. Several plans defining future relationships between Dow and Alcoa were discussed at the meeting. The most significant of these was one by Dr. Zay Jeffries, at that time head of Alcoa's research department:

"(Dr. Jeffries') plan," the memorandum reports, "is based on the consideration that if the magnesium business does not exceed 5,000,000 pounds per year we have no great interest in it. If, however, it becomes a greater business than is indicated by the above figure then we are interested not only in fabrication but also in production. Dow is about committed to the production figure given above and hence should be permitted to exploit that production without interference. In the interim we would buy metal as a preferred customer and continue development of its use. Other people might also carry on development (a selected few); we would, however, be protected by a favored pig metal price, or we might undertake the exclusive development of further metal use. When the 5,000,000 pounds per year production becomes market demand then we would arrange to share the production benefits with Dow while maintaining our fabrication benefits and even perhaps sharing them with Dow."

Dow, apparently was quite amenable to remaining A. M. C.'s supplier of metal, the same memorandum going on to state:

"Dr. Dow regards magnesium pig metal as a chemical and would like to sell large quantities of it to a few substantial customers. He does not look with much favor on developing its use except as he is forced to do so to sell the quantity of metal he has capacity to make."

Digitized by Google

So we see that the noncompetitive relationship between Alcoa and Dow was maintained, although the attempt to nullify the possible competition of I. G. was frustrated by Dow's refusal to participate in a joint production scheme.

I. G. FARBEN-ALCOA NEGOTIATIONS

This, however, did not prevent Alcoa from having further negotiations with I. G. A memorandum prepared by G. A. Hendrie, (employee of I. G.'s New York agent, Chemnyco, Inc.) dated November 26, 1930, speaks of "the recent Berlin negotiations when Mr. Arthur Davis of the Aluminum Co. was present" (exhibit No. 8). These negotiations appear to have been based upon careful study and consideration by Alcoa. A memorandum dated December 3, 1930, setting forth the basis of the negotiations is quoted in full in Bakken's report of January 24, 1931 (exhibit No. 9). An I. G.-Alcoa partnership in producing and fabricating magnesium was proposed. Bakken's report is a thorough study of the strong and weak points of such a combination in recommending that "a company formed of I. G. and (Alcoa) should, for the present at least, purchase metal from Dow." He concludes that "* * * a development business such as the magnesium business promises to be for a number of years will thrive best in a noncompetitive situation."

The negotiations with I. G., according to Alcoa President Roy Hunt's letter of March 12, 1931, to Hermann Schmitz, managing director of I. G. (exhibit No. 10), culminated in certain "definite understandings arrived at and agreed to by you and your associates on behalf of the I. G. Farbenindustrie and by me and my associates on behalf of the Aluminum Co. of America with respect to the production and fabrication of magnesium."

The understanding referred to, as outlined in the same exhibit, contemplated the formation of a patent licensing company to which would be transferred the relevant patents of both parties, and the formation by either or both of a magnesium production company, the capacity of which would be subject to limitation by I. G. Farben. Hendrie's memorandum of March 10, 1931 (exhibit No. 11), assumes that the production company would not start producing before January 1, 1933. It also indicates I. G. recognition of the fact "that there will be eliminated, to a certain extent, (fabricating) competition to Alcoa * * *."

THE ALIG AGREEMENT

By October 23, 1931, the Alig agreement, a formal document more fully covering the "understandings" between I. G. and Alcoa, was signed (exhibit No. 12). Acting under its terms the parties later formed the Magnesium Development Corporation, and to it transferred their magnesium patents. It should be noted that this agreement also had the effect of giving the I. G. shares in this patent holding company the exclusive right to limit output under whatever licenses might be granted above 4,000 tons per year. At the November 20, 1931, meeting of the interested persons, according to the Duisberg-Hendrie memorandum of November 21, 1931 (exhibit No. 13), it was agreed that Dow be informed of "the consummation of the agreement between the I. G. and Alcoa in the magnesium field * * *" and that "* * * Dow will be informed that it is our intention to create the most friendly relation with Dow. We are open to all of Dow's suggestions regarding cooperation. A three-party agreement, however, seems to be excluded by the Anti-Trust law." Mr. Dow was so informed on January 7, 1932 (exhibit No. 14).

DOW IS BROUGHT INTO THE FOLD

Negotiations were carried on between M. D. C. and Dow in March and April, 1932, with a view toward licensing Dow under the M. D. C. patents, but none of the proposals made were mutually acceptable (exhibit No. 15). Both sides had some patents on metal production techniques, but neither could be blocked in production by the patents of the other. The numerous patents held by each side on fabricating processes and alloy compounds were of greater strategic importance. I. G. Farben's Dr. Schmidt found in his interviews with prospective fabricating licensees under the M. D. C. Patents, that they "felt that there was no justifiable reason in paying tribute to M. D. C. when the metal had to be obtained and supplied by Dow" (exhibit No. 16). He believed that the only way of obtaining a monetary return on the M. D. C. patents, considering the

Digitized by Google

low cost of Dow's magnesium production, was to form a combined producing and fabricating company, and compete with Dow on the fabricated articles, which could be produced more cheaply by the M. D. C. forces (exhibit No. 17).

This, of course, would not at all suit Alcoa's book. Not only would it call forth the competition sought to be avoided, but it would bring into being a new magnesium producing unit in the United States. Obviously something had to be done to resolve the Dow-I. G. situation.

Alcoa regarded a patent infringement suit against Dow as the most effective course. W. D. Keith, Alcoa patent attorney, in his letter of May 25, 1932, to M. D. C. vice president Duisberg (exhibit No. 18) explained:

"Dow is either going to play with us or is not going to play with us. If they do not play with us, we have two courses before us. One is to enter into an oral argument over the entire industry with Dow. The result of this argument would simply be that a great deal of time, paper and energy would be wasted to no particular effect. The other course is to sue Dow with two objects in view, the first object being to bring Dow to terms, the second object being to actually prosecute the suit to its logical end. As a patent company, M. D. C. has nothing to offer at the present time except patents and technical information. Since they cannot make money on their technical information without their patents, they cannot deliberately refuse to recognize an outright challenge of the validity of their most important patent structure."

And I. W. Wilson, vice president of Alcoa and president of A. M. C., in his letter of June 3, 1932 (exhibit No. 19), further urged the suit in these terms:

"* * * we can only interpret (Dow's) silence as an indication on the part of Dow to go their own way if possible without any further sincere effort to meet our ideas. If this actually is their attitude it is more or less obvious to us that the only way they can be made to realize the soundness of M. D. C.'s position would be to bring a patent suit against either Dow or one of their customers."

The suit was brought. The effect was to open a series of conferences between Dow and Alcoa representatives in the autumn of 1932 (exhibit No. 20) which contemplated a long-term agreement for the purchase of magnesium by Alcoa from Dow. Dow was well aware of the position which Alcoa claimed for itself in the magnesium industry. Cheyney, the Alcoa salesman who was one of the initiators of these talks, reports the substance of a conference with Collings, the Dow board member:

"Consequently (Collings) could certainly not expect us to spend a lot of energy and a lot of money in the development of a product on which we had anything short of a firm hold. He agreed that this point is quite sound" (exhibit No. 20).

And Dow appeared to be willing to assist Alcoa in obtaining this "firm hold." Cheyney later on (exhibit No. 20) reported that Dow, through Collings, had proposed entering into "some sort of a long term contract by which the Aluminum Co.—or one of its affiliates—would become the exclusive distributor for Dow magnesium * * *."

At about the same time, according to the Hendrie memorandum of October 5, 1932 (exhibit No. 21), M. D. C. took "a new view on the question of issuing fabricating licenses. They are in agreement with the Alcoa organization that no effort should be made to sell fabricating licenses; that the best development of the patent situation is through a joint company marketing finished articles."

I. G. looked upon the Dow negotiations not unfavorably at first, but suggested the setting up of a pilot production plant as an offset to the danger of becoming entirely dependent on Dow as the only source of supply (exhibit No. 22; November 15, 1932). Later on, as it realized the probable effect of the proposed purchase agreement upon its plan to obtain revenue from the M. D. C. patents, and its plans to go into the production of magnesium, it objected quite strenuously. In its letter to Duisberg of December 23, 1932 (exhibit No. 23), it sets forth its understanding in the following language:

"We understand that under the purchase agreement, the American Magnesium Corporation purchases magnesium from Dow and that the Magnesium Corporation manufacturers and sells magnesium products. Since according to the (Alig) agreement the American Magnesium Corporation, as a subsidiary of Alcoa, does not pay any fees for the use of other manufacturing patents to M. D. C., neither the M. D. C. or ourselves will receive any compensation in this case.

"In case this agreement is carried out and in case the demand for magnesium increases, Dow will be able to prevent through further price reductions the

Digitized by Google

production of magnesium by Alcoa and I. G. * * * Dow * * * and Alcoa will benefit while * * * our experiences and patents are being used without compensation by the M. D. C. in the American market."

In fact, I. G.'s opposition was so strong that it thought it might be best to sell out to Alcoa its entire interest in M. D. C. (exhibit No. 24).

But, apparently, Alcoa had prepared itself for an offering of a quid pro quo to I. G. As early as November 18, 1932, "Alcoa (was) willing to accept (I. G.) as a 50–50 partner in the fabrication as well. Plans have already been drawn up with a 50–50 participation in the American Magnesium Corporation" (exhibit No. 25). The reasoning was that if I. G. could not obtain revenue from the M. D. C. patents, it could share in the profits of a fabricating company purchasing its material at a low price, and able, as Schmidt pointed out to fabricate magnesium more cheaply than its competitors. And remember that the groundwork for this proposal had already been laid in M. D. C.'s "new view on the question of issuing fabricating licenses," already referred to.

It appears that in late January or early February of 1933, Wilson of Alcoa and Duisberg of M. D. C. went to Germany and negotiated the contract of February 8, 1933, with I. G. (exhibit No. 26). By this contract Alcoa and I. G. agreed to become 50–50 partners in A. M. C. Paragraph twelfth of this contract, however, was an express consent by I. G. to the Dow-A. M. C. purchase contract negotiations.

The partnership of I. G. and Alcoa in A. M. C. was a wholehearted one. One of the early steps undertaken to cement this intimate relationship was the employment by A. M. C. of one of I. G. Farben's magnesium experts, Heinz Menking. This was facilitated by I. W. Wilson, in his capacity as vice president of Alcoa (exhibit No. 27, Wilson to United States Consul, March 18, 1933), I. G.'s interest in Menking's employment is indicated in Duisberg's cable to Hochswonder, president of M. D. C., dated August 4, 1933 (exhibit No. 27a), wherein it was suggested that Menking's ideas of the salary he was to obtain at A. M. C. be discussed with I. G. directors, Pistor and Schmidt.

Menking, as an A. M. C. employee, was useful to I. G. In response to a request in 1934 for a summary of the extent of the uses of magnesium in American aircraft engines (exhibit No. 28, I. G. to A. M. C., September 21, 1934), Menking prepared and sent to I. G., on March 15, 1935, a concise tabulation naming the parts of particular engines fabricated from designated magnesium alloys (exhibit No. 29). Engines manufactured by seven different American concerns were listed. Evidently A. M. C. officials felt that these disclosures went beyond the ordinary bounds of collaboration, since, on May 27, 1935, Vice President Norton wrote to I. G. asking it to consider the information furnished by Menking as "extremly confidential." Norton's expressed reason for this request was that "it is customary in the United States never to use information of this sort in publicity without the written approval of the company whose product is mentioned" (exhibit No. 30).

A. M. C. was sensitive of the complications caused by Menking's German citizenship. President Harvey in a letter of October 20, 1936, to Los Angeles Sales Manager W. C. Lynch, wrote:

"We are not particularly keen to ask for (War Department) permission (for Menking to visit aircraft factories) inasmuch as it would throw into the open the fact that Mr. Menking is a German citizen and in our employ" (exhibit No. 31).

However, full use was made of Menking's talents in connection with the interchanges of information between I. G. and A. M. C. He was one of those who met and discussed technical problems with I. G. representatives (exhibits Nos. 32 and 33). He also accompanied German engineers (whose plants he had visited) (exhibits Nos. 34, 35, and 36), on their visits to American aircraft plants although the Navy Department sometimes refused him permission to inspect these plants, while it permitted the entry of the German engineers (exhibit No. 37). Just why the Navy exercised this discrimination against Menking is somewhat obscure, since, as late as June 22, 1938 (exhibit No. 38), I. G. apparently regarded Menking as a full-fledged German citizen, subscribing its letters to him with the complimentary closing proper in such cases—"Heil Hitler!"

Another restriction on the magnesium industry of the United States was effected by paragraph ninth of the contract of February 8, 1932 (exhibit No. 26). By its terms, "Alcoa and I. G. agree that they will not start or undertake any fabrication of magnesium in the United States of America and its de-

Digitized by Google

pendencies outside of A. M. C. except upon request of A. M. C." The effect of this clause was to prohibit I. G. from independently entering the fabrication field in the United States, and thus part of the foreign competition, foreseen by Bakken, was eliminated.

The remaining danger—that of competition in production by I. G.—was eliminated when the 5-year purchase contract between A. M. C. and Dow was signed on June 24, 1933 (exhibit No. 39). The price scale ran from 23½ cents per pound to 19 cents per pound, and Duisberg had written to I. G., in his letter of January 14, 1933, that

"Dow was willing from the beginning to make a price of 24¢ per pound decreasing to 19¢ per pound (almost exactly the price calculated by I. G.), if the sales would amount to 1,500,000 pounds within five years. This price scale eliminated the * * * argument * * * that the I. G. could produce cheaper in its pilot plant than Dow" [exhibit No. 39A].

CONTROL OF POSSIBLE DOW PRICE COMPETITION

This purchase agreement also removed some of the competition between Dow and A. M. C. in the sale of fabricated articles. What was described as a "Most Favored Nation" clause, provided that the A. M. C. would receive "the benefit of the then prevailing lowest net price made by (Dow) to any of its customers in the United States." In the sale of fabricated products, Dow was to compute the prices charged on the basis of a prescribed formula. One element in this formula was the "fair cost" of fabrication which was defined. The components of this were subject to check by independent auditors in order to assure A. M. C. that Dow included the same cost elements as did A. M. C. The pricing formula included the price of the metal used in the fabrication and included profit at a specified rate. If Dow charged itself (in its fabricating operations) a metal price lower than that at which A. M. C. was currently being supplied, then A. M. C. was to have the benefit of a correspondingly reduced metal price. Thus whatever Dow's actual cost of fabrication was, the price at which it sold the fabricated article could never be lower than the price at which it sold the raw metal to A. M. C.

The reason for the insertion of this clause can be seen from the following correspondence. For example, a letter of December 9, 1932, from Alcoa to I. G. states:

"Our main worry is that Dow in selling its manufactured products will figure magnesium at the same price at which it is sold to us. In order to protect us against this danger, we have inserted a special paragraph * * *" (exhibit No. 40).

The December 23, 1932, letter from Wilson to Hendrie (who had then become Secretary of M. D. C.) (exhibit No. 41) states that "Mr. Dow seems to recognize the fairness of some protection to us to cover Dow's sale of fabricated or semi-fabricated magnesium * * *" And on December 27, 1932, Wilson writes to Hendrie (exhibit No. 42):

"I have been trying to think of some plan which could be incorporated into the proposed agreement which would afford us reasonable price protection in connection with Dow's sale of fabricated and semifabricated magnesium and at the same time might be acceptable to the Dow Company, as it seems to me that this is the most important point we have to cover in this pending negotiation."

On the 24th of December 1932, Wilson had written to Harvey (exhibit No. 43), asking for his comments and suggestions on the Dow negotiations, saying in part: "* * * the question of our protection, particularly in regard to fabricated and semifabricated sales by Dow, seems to present the greatest problem."

On December 31, 1932, Harvey replied (exhibit No. 44), writing:

"The real importance of insisting that this favored Nation Clause in some form apply to semi or fully fabricated products is not so much that we would by this means obtain a lower purchase price for our metal, but rather to insure that all calculations of cost are made on substantially the same basis."

DOW JOINS THE PATENT POOL

Almost immediately upon the signing of the purchase agreement, negotiations were entered into between Dow and M. D. C. relative to the cross-licensing of their respective fabrication patents. M. D. C. withdrew the patent infringement suit and a cross-licensing agreement was finally signed as of January 1, 1934 (exhibit No. 45). But the agreement was contemplated by Alcoa much earlier.

Digitized by Google

Bakken, in his "Confidential report" of May 17, 1930 (exhibit No. 46) indicates the general background of a possible relationship among the parties in these words:

"For the immediate present, with Dow as sole producer and ourselves and I. G. Farbenindustrie, A. G., following up fabrication processes and fundamental research to increase the use of magnesium, it is extremely doubtful whether anyone else would attempt to break into the magnesium business. As has been pointed out before, the two companies together would have a very strong patent situation. It is felt that this situation alone would make the entry of other interests unattractive. Even Dow Chemical Company and people whom he might interest in fabrication of magnesium would, from a patent standpoint, find heavy weather."

But when an exact study of Dow's patent situation was made, Bakken changed his mind somewhat about the heaviness of the weather Dow would encounter. Writing another of his reports, dated January 24, 1931 (exhibit No. 47), he states:

"The patents of Dow, taken as a group, are the strongest group of patents on magnesium base alloys in this country. It appears that they will cover the newly developed alloys which will be important in future years. * * * We would state that of the three parties (A. M. C., I. G., and Dow), Dow has the alloy patent situation containing the best inherent future possibilities."

And, later in the report:

"A. M. C. and Dow together own valuable heat treatment patents which effectively prevent, under present practice, the successful heat treatment of magnesium base alloys in this country [by other parties]. * * * I. G. has no heat treatment patents and is utterly without status in this country in this connection, but applications are on file. * * * The valuable heat treatment patents have now issued. It is doubtful whether any exceptionally broad heat treatment patents will issue in the future to any of the parties or to any other persons."

He concludes, after having examined all of the relevant patents of the three parties:

"It is to be noted, however, that if I. G. and Dow were to combine in their patents, a strong situation would be presented in that the combined patent structure would control the sand casting of magnesium and a great many magnesium alloys. It would also control the heat treatment of magnesium except insofar as A. M. C. is concerned.

"The strongest patent combination lies between I. G. and A. M. C., because the patent situation of these two companies are complementary. * * *"

So that, even if we were not to venture the hypothesis that the cross-license was intended to control independent fabricators of magnesium (as it in fact did), its effect was to render the three parties invulnerable to competition in fabricating.

RESTRICTION OF DOW-A. M. C. COMPETITION BY 1934 AGREEMENT

Possible competition between Dow and A. M. C. had been foreseen during the negotiations, I. G. having cabled Duisberg on September 1, 1933 (exhibit No. 48), that its approval of the proposed agreement was "contingent upon your investigation whether by this proposal Dow's ability to compete with A. M. C. on fabrication field is undesirably increased * * *"

To a certain extent this competition was eliminated by, as Keith wrote to Joslin, patent counsel for M. D. C., on September 13, 1938, "a side agreement between the parties."

"It was then arranged that all parties would issue the same type of sub-license, and that the sub-license should be royalty-free, nontransferable, and nonexclusive, and should be issued * * * '* * *' in connection with magnesium purchased from Licensor by Licensee * * *'" (exhibit No. 49).

In his letter to Duisberg of February 1, 1934 (exhibit No. 50), Keith had described this "side agreement" as "our main purpose." Earlier (January 15, 1934, exhibit No. 51) Keith had justified to Currie the issuance of such a license in the following terms:

"Such action will insure that the prospective sub-license shall have no choice as between Dow and A. M. C. on the grounds that one company is issuing a better license than the other company."

It appears that another understanding, not quite as explicit as the "side agreement" just referred to, also existed between Dow and A. M. C. with regard

Digitized by Google

to competition in fabricating. This arrangement appears to have existed at least as early as February 13, 1933, when Harvey, in a memorandum to A. C. Cooper, of the sales department (exhibit No. 52), wrote:

"The Dow Chemical Company are very active in their drive for magnesium castings business and while they would not purposely interfere with any of our sales which were going along well they might very innocently approach your customer and offer to make castings at lower prices."

The Syntron incident (exhibit No. 53) is likewise enlightening. In this case Harvey, having received a report that Dow had quoted an extremely low price to Syntron, phoned Sales Manager Grant, of Dow, and upon apprising him of the facts received a very profuse apology from Grant for the error which had been made. Harvey concludes in his interoffice memorandum of March 23, 1933, to Runnette:

"I think it has been very helpful to encounter this proposal and be able to show Mr. Grant that he has made a bad error."

OTHER RESTRICTIVE EFFECTS OF 1934 AGREEMENT

The cross-licensing agreement of January 1, 1934 was effective in controlling the activities of independent magnesium fabricators until the entry of the consent decree obtained by the Antitrust Division on April 15, 1942.

In the first place, it appears to have been Dow's practice to license only such fabricators who would, in advance, enter into a purchase contract with it. As an example, we have Grant's letter to Superior Bearing Bronze Co., of April 8, 1940 (exhibit No. 54), part of which reads:

"We are enclosing a proposed sales contract in duplicate covering your requirements for twelve-month period starting April 1, 1940. If this contract is satisfactory to you please sign and return one copy. Upon receipt of this signed sales agreement we will forward you our standard license for sand casting."

There are also other restrictive practices which Dow was enabled to effect because of its participation in the contract of January 1, 1934. One of these practices is the "stacking" of customers for the benefit of one of its licensees to the exclusion of others. An example of this practice is set forth in the memorandum of Stearns to Caple (both of Dow's magnesium sales division) of April 4, 1939 (exhibit No. 55). Stearns writes:

"* * * It is felt that if (the) Hills-McCanna representative can develop any business in (the Cincinnati) territory, that there is no reason why he should not do so. However, as you know, the Wellman Bronze and Aluminum Company have also been working on a number of customers in Cincinnati and the vicinity and has developed a certain amount of business of their own, and it is felt that it would be unwise both from our standpoint and from the standpoints of the two companies for them to compete for business in the same company. * * * It is therefore suggested that I discuss this situation with Mr. Stroebel (of Hills-McCanna) along these lines during my next visit to Cincinnati."

Dow also restricts the territory within which its licensees may operate. For instance, when a foundry in New Jersey wished to undertake the casting of magnesium, Otis Grant, Dow's eastern representative, recommended to Sales Manager Leo Grant, on April 15, 1939 (exhibit No. 56), that he "(did) not believe it would be worth while entering into a license agreement with the subject company in view of our set-up with Eclipse." Eclipse was a licensee of Dow, casting magnesium and selling it in the same area. Accordingly, Leo Grant wrote to the applicant on April 18, 1939 (exhibit No. 57), stating:

"Dow metal casting is now subject to license by our company and under the present circumstances we do not believe it advisable to extend a license at this time."

The device in the Dow license contract which enabled it to exert power over its licensees was a 1-year cancelation clause. The practice of tying the license to the purchase of metal, as set forth in Keith's letter of September 13, 1938, to Joslin (exhibit No. 49) appeared to have been a settled policy of Dow long prior to the agreement of January 1, 1934.

It should be noted that until 1941 these pooled and cross-licensed patents in the shelter of which the Dow-Alcoa-I. G. group continued to operate successfully prevented the persistent attempts of outsiders to enter the magnesium industry.

CONTROL OF MAGNESIUM EXPORTS

Moreover these patent agreements had effects not only within the United States but in the international sphere. Whether as a means of advancing German rearmament or in order to secure more favorable prices for the group by increasing Dow's sales of magnesium metal, the affiliated I. G. interests in Germany in October 1934 offered to purchase from Dow a substantial volume of metal. This order was for 350 tons in the latter part of 1934 and for 600 tons in 1935 with an option for purchases at the same rate in 1936 and 1937. An order for such a quantity representing almost 50 percent of Dow's capacity at that time and more than the total volume of its domestic sales proved attractive to Dow. Even though the price was only 20 cents per pound they accepted. This was the final contract affecting the relations of the parties. It is dated September 5, 1934, and consists of a copy of a letter from Mr. L. I. Doan, general sales manager of Dow, to Duisberg (exhibit No. 58). The contract carried the significant provision that Dow was not to export metal to any other European country during the term of the contract with the exception of a maximum 150 tons per year to Great Britain. It was also provided that the price of metal sold to Dow's British customer should not be less than 4 cents per pound above the price at which I. G. was supplied. Dow further agreed to do its best to keep the British from reselling magnesium in ingot form. Thus from September 1934 for about 2 years Dow supplied I. G. Farbenindustrie, the principal European producer, with a volume of magnesium that ran as his as 60 percent of its current output, at a net price one-third below the then prevailing domestic market price of 30 cents per pound. In this way I. G. Farben was able to use a patent pooling arrangement not only to limit production in United States but to retard the development of the magnesium industry in Europe and to keep Europe dependent upon Germany for supplies.

EFFECT OF NATIONAL EMERGENCY ON MAGNESIUM PRODUCTION

During the period of the Antitrust Division's investigation of the magnesium industry, other governmental agencies expedited the construction of additional magnesium production facilities.

The Dow Co. began to expand production in 1941, and it agreed to license and assist some other companies in the production of magnesium by its process. The British Government financed additional capacity both at Midland, Mich., and at Freeport, Tex., where sea water is used as a raw material and the United States Government through the Defense Plant Corporation is building additional capacity to be operated by Dow.

On March 6, 1941, a contract (exhibit No. 59) between the Defense Plant Corporation and the Dow Co. provided that the Dow Co. should lease a site near Freeport, Tex., and plan, construct, and equip a plant there. The Defense Plant Corporation agrees to pay not more than $8,007,407 for the buildings and machinery, which it will lease to the Dow Co. The annual rental to be paid by Dow is 3 cents per pound on the magnesium metal produced over 6,000,000 pounds and up to 18,000,000 pounds, and 8 cents per pound on the production in excess of 18,000,000 but not exceeding 36,000,000 pounds. The rental payments will end when the Government has recovered its investment. At the termination of the lease Dow will have the right to purchase the plant at a price based on the actual cost of the plant to the Government plus interest at 4 percent per year less the amount of rentals paid by Dow; or at a price based on the actual cost of the plant to the Government less depreciation and obsolecence.

On October 4, 1941, a contract (exhibit No. 60) between the Defense Plant Corporation and the Dow Magnesium Corporation provided for the construction and operation of a plant near Velasco, Tex., by the Dow Magnesium Corporation. As a fee for the management and operation of the plant and the sale of its products, the Defense Plant Corporation will pay one-half cent per pound on all magnesium metal produced in the plant. This fee may not be less than $60,000 a year unless the plant should have a productive capacity of less than 72,000,000 pounds a year, in which case the minimum fee shall be reduced by $10,000 for each reduction of 12,000,000 pounds of magnesium. The Dow Magnesium Corporation will have the right to purchase the plant at a price to be determined by arbitration.

On October 4, 1941, a contract (exhibit No. 60) between the Defense Plant Corporation and the Dow Chemical Co. provided that the Dow Chemical Co. would prepare all the plans for and give scientific advice for the operation of the plant to be operated by the Dow Magnesium Corporation near Velasco, Tex. In return,

Digitized by Google

the Defense Plant Corporation will pay Dow Chemical Co. 1 percent of the Defense Plant Corporation's expenses for the cost of the plant. But this payment may not exceed $520,000. In addition, the Defense Plant Corporation will pay the Dow Chemical Co. three-fourths of a cent for each pound of magnesium metal produced by Dow's electrolytic process or any other electrolytic process. Until production in this plant and in the Diamond Magnesium Corporation plant near Painesville, Ohio, shall have reached 414,700,000 pounds of magnesium metal, the Defense Plant Corporation will also pay the direct expenses including the wages and salaries of the Dow officers and employees in connection with the construction and operation of the plant.

In addition to increasing its own facilities, the Dow Chemical Co. was asked by the United States Government to license and assist other companies in the production of magnesium by its process, and the Defense Plant Corporation made contracts with Mathieson Alkali, the Diamond Alkali, and the International Minerals and Chemicals Corporation to produce magnesium by this process.

'On October 13, 1941, a contract (exhibit No. 62) was entered into between the Defense Plant Corporation and the Dow Chemical Co. whereby Dow agreed to disclose its electrolytic process and facilities and to give technical advice to the Diamond Alkali Co. for a plant to be operated by Diamond near Painesville, Ohio. As compensation, the Defense Plant Corporation agreed to pay Dow 1 percent of the Defense Corporation's expenditures for the cost of the plant to be erected for the use of Dow's or any other electrolytic process; but this fee is not to exceed $160,000. The Corporation will also pay Dow three-fourths of a cent for each pound of magnesium metal produced in the plant by Dow's or any other electrolytic process until production in this plant and in the plant to be owned by Defense Plant Corporation and operated by Dow near Velasco, Tex., shall have reached 414,700,000 pounds of magnesium metal. Furthermore, Defense Plant Corporation will pay Dow all reasonable traveling expenses and similar out-of-pocket expenses for their work in consulting with the Defense Plant Corporation and/or the Diamond Co.

The Diamond Alkali Co., which manufactures sodium alkalies and related chemical products, will use Ohio dolomite as the raw material for making magnesium.

On December 12, 1941, a similar contract (exhibit No. 63) between Defense Plant Corporation and the Dow Chemical Co. provided for the disclosure by Dow of its electrolytic process to the International Agricultural Corporation (now International Minerals & Chemical Corporation) for a plant to be built by the Defense Plant Corporation but to be operated by the International company.

This plant will be constructed near Austin, Tex. It will be operated by the Union Potash & Chemical Co., a subsidiary of International Minerals & Chemical Corporation. It is to have an annual capacity of 24,000,000 pounds and will be operated in conjunction with a chloride plant at Carlsbad, N. Mex., where the potash deposits of the company are located.

The Mathieson Alkali Works is one of the smaller chemical companies engaged mainly in the production of alkalies, soda ash, and caustic soda. A magnesium plant to be operated by this company will be owned by the Defense Plant Corporation. It will cost approximately $22,500,000 and will have an annual capacity of 36,000,000 pounds of magnesium. It will be located near Lake Charles, La., near Mathieson's alkali plant. The raw material used will be dolomite ore, which will come from the Mathieson deposits at Burnett, Tex. This will be combined with calcium chloride, a waste byproduct from the ammonia-soda alkali process.

The contract between Dow Chemical Co. and the Defense Plant Corporation whereby Dow would agree to transfer the "know how" to Mathieson has not yet been signed.

In addition, Basic Magnesium, Inc., Permanente Metals Corporation, and Union Carbide & Carbon Co. are now undertaking the construction and operation of other magnesium producing units.

GOVERNMENT ACTION—THE CONSENT DECREE

Most of the above facts were derived from an investigation of the magnesium industry begun by the Antitrust Division in July 1940. This investigation culminated in the presentation of three indictments in the Southern District of New York on January 30, 1941 (exhibit No. 64, 65, 66).

Digitized by Google

The indictments charged Alcoa, Dow, I. G. Farben, M. D. C., and A. M. C., with conspiring to fix prices, to restrain trade, and to monopolize the magnesium industry. It was also charged that a monopoly was actually effected.

In March 1941, the defendants undertook negotiations with the Antitrust Division for a consent decree. These negotiations continued until April 15, 1942, when the decree was entered. This decree (exhibit No. 67) provided that—

1. All existing patent licenses among the parties were canceled and the parties were enjoined from taking any action under these patent licenses;

2. Each of the corporate defendants and its affiliates was required to grant to any applicant a royalty-free license under any fabrication or production patent owned by it. In the case of the production licenses, however, a reasonable royalty might be charged after the present emergency.

3. Under Dow's contracts with the Defense Plant Corporation, that part of Dow's compensation therefor which represented royalty on account of its production patents was to be canceled.

4. Magnesium Development Corporation was prohibited from acquiring any other patents or patent rights.

By this means not only was the conspiracy terminated for all time, and the restrictions referred to above removed, but a positive influence was directed toward the expansion of the magnesium industry, since under the terms of the decree rights under the pooled patents were available to all who made application therefor. The long history of negotiations after a full discovery had been made of the restrictions effected under the pooled patents indicates what might be avoided if S. 2303 or a bill with like effect were law. If the President had had the power to seize the M. D. C. patents when their restrictive use was disclosed in January 1941, the magnesium industry might now well be far ahead of its very limited present production rate.

EXHIBIT No. 131

COMMUNICATION PATENTS

Statement by William H. Bauer

My purpose in appearing here is to advise this Committee concerning the legislative recommendations which the Federal Communications Commission has made regarding communication patents.

The Federal Communications Commission was established by Congress in 1934, and it was given regulatory jurisdiction over all nongovernmental communications—wire and radio. The Federal Communications Commission succeeded the Federal Radio Commission in the regulation of radio broadcasting.

On March 15, 1935, the President approved a joint resolution of Congress (Pub. Res. 8, 74th Cong., 79 Stat. 43) authorizing the Federal Communications Commission to investigate and report on the American Telephone & Telegraph Co. and all other companies engaged directly or indirectly in telephone communication in interstate commerce. The resolution was drawn in broad terms authorizing the Commission to investigate and report to Congress regarding various phases of the telephone business, including research and patents.

The Commission completed the telephone investigation under Public Resolution No. 8 during 1937 and a proposed report drafted under the supervision of Commissioner Paul A. Walker was transmitted to Congress February 23, 1938. The final report of the Commission on the telephone investigation was transmitted to Congress on June 14, 1939. This report was printed as House Document No. 340, Seventy-sixth Congress, first session. The report was unanimously adopted by the members of the Commission, who where at that time Frank R. McNinch, Chairman, Norman S. Case, T. A. M. Craven, George Henry Payne, Frederick Thompson, Thad Brown, and Paul A. Walker.

I have made a few copies of this final report available to this committee. The report contains a recommendation as to patent legislation which will be found on page 601, and reads as follows:

"8th. In the event of the refusal of any common-carrier utility engaged in interstate communications to license others upon reasonable terms under any patents obtained in connection with communication service to the general public as a common-carrier utility, the Commission should be empowered, upon the application of parties so refused, to order the issuance of such license; *provided*, That the granting thereof will not be detrimental to the communication service

Digitized by Google

rendered by the utility holding such patents and not detrimental to technical progress."

The proposed report, prepared under the supervision of Commissioner Walker, to which I have previously referred, contained a broader recommendation as to patent legislation. I also have made a few copies of the Walker report available to this committee. The patent recommendations occur on page 712 of the report and read:

"(b) The power to permit the Bell System, or any utility engaged in interstate communications, to obtain (under the determinations of this Commission) the *right to* use patents, owned by others, which may be essential to the rendition of its communications service to the public.

"(c) In the event of the refusal of the Bell System, or any utility engaged in interstate communications, to license others upon reasonable terms under any patents obtained in connection with communications, the Commission should be empowered, upon the application of parties so refused, to order the issuance of such license, providing that the granting thereof will not be detrimental to the communications service rendered by such utility."

Paragraph (c) of the Walker report is quite similar to the patent recommendations of the final report.

Paragraph (b) of the Walker report goes further as to patents in the communications field; it provides for the licensing of any patent, irrespective of ownership, to persons engaged in communication service to the public. This has the specific purpose of preventing the interference of patents with the building up of the best communication facilities available. In contradistinction, the patent recommendation in the Commission's final report and paragraph (c) of the Walker report, go only to the compulsory licensing of patents obtained in connection with public service communications.

The findings which form the basis of the patent recommendations in the Walker report and the patent recommendation in the Commission's final report are the same. Therefore, I will limit my further discussion to the final report of the Commission. Turning to the final report, you will find chapter 8 (pp. 213–246) deals exclusively with the subject of patents. Chapter 7, entitled "Research," also deals with patents, in so far as related to the work of research of the Bell System, and chapter 9 on Engineering and Standardization presents patent information relating to the subject of standardization of telephone equipment.

In brief, chapter 8 of the Commission's final report sets forth the policies adopted by the Bell System for achieving its patent objectives; the development and application of these patent policies and practices; the patent position of the Bell System as of January 1, 1935, and the intercompany patent relationship of the Bell System as of the same date.

In part II of the report, on page 583, will be found the Commission's findings as to Bell System patents. If the committee has no objection, I will read these findings, which are less than two pages, and amplify the same from other parts of the report where I believe such amplification might be helpful to this committee:

"The patent structure of the Bell System has grown from the two original Bell patents to a structure involving the ownership of more than 9,000 patents and rights under an even greater number of patents owned by others. From the beginning, control over Bell System patents has been centralized in the parent company of that system."

I might add at this point that the Bell System was built on patents. Also, in order to clarify what I have just read, I might add that since 1900, the American Telephone & Telegraph Co. has been the parent company of the Bell System. Prior to 1900, the parent company was known as the American Bell Telephone Co.

"Prior to the expiration of the Bell patents, the system had established the policy of acquiring all patents and patent rights related to communications deemed by it essential for the maintenance of its position in the communications field."

Here I might add that this policy of acquiring patents and patent rights was accomplished both through the purchase of patents and patent rights of any particular importance to the telephone field, and the securing to the greatest possible extent patents upon technical developments made by the Bell System. On the other hand, the Bell System granted few licenses under its patents and its licensing policy was such as to obtain maximum rights under the patents of

Digitized by Google

others, and to grant such restricted licenses under its own patents as not to endanger the Bell System in the field of telephony.

"Prior to 1908, the Bell System vigorously prosecuted patent suits against telephone companies engaged in telephone exchange service to the public. Later, these infringement suits were discontinued and the Western Electric Company was permitted to sell telephone-exchange equipment and certain types of toll equipment to the public under such restrictions as the American Company might impose from time to time."

These restrictions were such as to limit the use of the telephone devices sold by the Western Electric Co. to fields that would not endanger the position of the Bell System in the field of telephony (wire and radio).

"The Bell System has at all times maintained a controlling patent position as to equipment and instrumentalities necessary for rendering efficient and economical long-distance telephone service to the public. The system has also maintained patent control of public service in two-way radio telephony. In 1930 this system obtained control of the manufacture and sale of the teletypewriter; and in recent years has maintained control of devices considered necessary for the economical operation of broad-band-carrier systems over coaxial cables. The Bell System has maintained complete patent protection as to the types of automatic exchange equipment standardized for the telephone operating companies. The Bell System also obtained a strong patent position in sound motion pictures and a like patent position in sound amplifiers for public address and theater purposes."

I might point out to the committee that the control of manufacture and sale of the teletypewriter includes patent control. I might also point out that the strong patent position obtained by the Bell System in sound motion pictures was a byproduct of the research in the telephone field carried on by the Bell Telephone Laboratories and the Western Electric Co.

"By virtue of its policies and practices concerning the acquisition of patents and patent rights, the Bell System has continuously held from year to year a large number of unused patents. Patent suppression is commonly understood to mean ownership or control of patents and the intentional nonuse thereof. With the Bell System the nonuse of the patents has resulted in part from acquisition to protect and maintain as near as possible a complete occupation of the telephone field, both as to services to the public and as to manufacture of equipment therefor."

As I have before stated, this report shows that the Bell System in 1934 owned more than 9,000 patents and had rights under even a greater number of patents owned by others. Of the total number of patents owned, less than half were used. A great many of the unused patents covered alternatives of the methods and equipment used by the Bell System. This large number of unused patents was due to the policy of the Bell System to acquire patents and patent rights of any particular importance to the telephone field, even if no use was intended. As an example of this practice, I refer you to footnote 29 on page 192 of the Commission's Final Report, where it is shown that from correspondence taken from the files of the Western Electric Co., it was the adopted practice in connection with certain of the devices used in long-distance telephone, to develop and patent all alternatives for which there was no intended use.

"For the purpose of maintaining the exclusive right of manufacture and sale of patented equipment of Bell telephone operating companies, Bell System patent rights are so divided under intercompany contracts and agreements that the operating companies obtain the right to use patented methods and equipment made available to them, while the manufacturing subsidiary of the Bell System (Western Electric Co.) obtains the exclusive right to manufacture and sell under said patents, thereby compelling the operating companies to purchase their equipment covered by Bell System patents from the Western Electric Co."

In explanation of that just quoted, the intercompany contracts and agreements include the license service agreements between the American Telephone & Telegraph Co. and the so-called Bell telephone operating companies. These license service agreements are dealt with in chapter 6 of the Commission's report.

"Whether patent rights held by the Bell System are acquired by purchase or result from research and development, the expense thereof is borne either directly or indirectly by operating licensee companies. The manufacture and sale of patented equipment to the operating companies of the Bell System, as provided for in the intercompany contracts and agreements respecting Bell System patents, places in the hands of the Western Electric Co. the exclusive right to manufacture and sell all equipment covered by Bell System patents to telephone

Digitized by Google

operating companies that do substantially 90% of the telephone business in the United States. This system of manufacture and sale of equipment may be repugnant to the spirit of the anti-trust laws of the United States. Such a condition also introduces a problem in the complete and proper regulation of the telephone industry, i. e., it eliminates any possibility of the Bell Telephone operating companies securing equipment covered by Bell System patents on a competitive bidding basis and thereby renders impossible the securing of significant comparative prices upon equipment included in the rate base underlying 90% of the telephone business in the United States."

The particular antitrust law referred to in the matter just quoted is section 10 of the Clayton Act, United States Code Annotated, title 15, chaper I. This section has to do with prohibiting the purchase of equipment, except through competitive bidding, by any common carrier engaged in commerce exceeding the amount of $50,000 in any 1 year from another corporation having on its board of directors or as its president or manager any person who at the same time holds a similar office in the corporation of the common carrier concerned.

"The 'cross-licensing agreements' in which the American Co. and the Western Electric Co. constitute the 'telephone group' and the General Electric Co., the Radio Corporation of America, and the Westinghouse Electric and Manufacturing Co. and other companies constitute the 'radio group,' represent the most extensive licensing of others under Bell System patents that has occurred in the history of that system. But these cross-licensing agreements do not represent a free exchange of licenses between the companies concerned, in that the chosen fields of the 'telephone group' and the chosen fields of the radio group are kept intact, i. e., under the agreements the American Co. retains its exclusive rights under Bell System patents in two-way telephone services to the public (wire and radio) while the General Electric Co., the Radio Corporation of America and the other companies of the radio group retain similar privileges in their respective fields.

"The licensing of others under Bell System patents has been of a limited character. The policy of the American Company has been to withhold licenses from others except in those fields that do not threaten the primary interests of the Bell System."

At this time I wish to again point out that these findings definitely show an unremitting policy on the part of the American Telephone & Telegraph Co. and its manufacturing subsidiary, the Western Electric Co., to acquire and maintain through purchase and development all such patent rights as are necessary to maintain a dominant position in the telephone field both as to service and manufacture of equipment, and to maintain a patent-licensing policy which will not interfere with this dominant position. These practices result in many unused patents and also eliminate any possibility of the operating Bell Telephone Co. securing patented equipment through competitive bidding. The form of compulsory licensing recommended by the Commission negatives these practices when public interest is served.

"The ownership and control of patents by the American Company contributes to its ability to control the exploitation of potentially competitive and emerging forms of communication, such as Teletypewriter Exchange Service and two-way public radio telephone service."

This last paragraph of the findings clearly indicates the conflict that might arise between patent control and the Commission's regulation of the communcations industry in bringing about the most efficient communication service. To be more explicit, let us assume that under the present permissive merger legislation now being considered by Congress of the telegraph companies, it is specified that the telegraph companies have the benefit of the teletypewriter exchange services. As shown by the report of the Commission on the investigation of the telephone industry, the control of the teletypewriter patents is in the Bell System. Therefore, the teletypewriter exchange services could not be placed in the hands of the telegraph companies unless a license is obtained under the Bell System teletypewriter patents. Also, should the telegraph companies wish to use the coaxial cable for improving their services, the same situation would pertain. I might add that the coaxial cable would permit over one cable the transmission of, say, 2,000 telegraph messages simultaneously. That would be a great boon if needed in the telegraph field. But that is covered by patents held by the Bell System. There is such a cable between Philadelphia and New York now being used for telephone messages. Again, the same situation would be true in case a person applied to the Commission for furnishing two-way radiotelephone service in the United States.

RADIO-BROADCAST PATENTS

The patent recommendations of the Federal Communications Commission are limited to the compulsory licensing of patents for use in the common-carrier field. The patents that are excluded under the Commission's recommendations pertain particularly to radio-broadcasting. The Commission has made no legislative recommendations as to radio-broadcast patents because Congress has never requested the Commission to investigate and report upon such patents. The Commission has, however, pursuant to section 218 of its act, kept itself informed as to radio-broadcast patents and has also kept itself informed in general, regarding the licensing policies of the principal patent holding companies in the radio-broadcast field.

The Radio Corporation of America is the principal holder of radiobroadcast patents, and if there is no objection, I will be glad to give what information the Commission has regarding the licensing policies of this Corporation in the radio-broadcast field. I will also point out the manner in which private control of radio-broadcast patents, at times, may interfere with the Commission's duties in bringing about a larger and more effective use of radio in the public interest.

Before proceeding with the present policies of the Radio Corporation of America regarding its radio-broadcast patents, it is best that I review briefly the history of such patents and the Radio Corporation of America's part therein.

At the beginning of the first World War, the Government called upon manufacturers for considerable radio equipment. At that time there was on the statute books the act of June 25, 1910 (36 Stat. 851), giving the right to any person whose patented invention was used or manufactured by the United States to sue in the Court of Claims for the recovery of reasonable compensation for such use or manufacture. When the Government desired large quantities of radio material in 1917 that would infringe patents held by different parties and radio companies, contractors balked at the idea of accepting such contracts because the patent statute I just mentioned did not make the Government liable in the case where the infringing devices were manufactured for the Government. On July 1, 1918, the act of June 25, 1910, was amended (40 Stat. 705), so as to make the Government additionally liable as to infringing devices manufactured for it.

The Government's extensive use of radio in the first World War gave radio broadcasting a great impetus. At the termination of the war a number of companies were interested in radio and each held patents. These companies included the Marconi Wireless Telegraph Co. of America, General Electric Co., Westinghouse Electric & Manufacturing Co., the Western Electric Co., and the American Telephone & Telegraph Co. The manufacture of radio equipment, particularly tubes, by any one company was more or less blocked because of infringement of patent rights held by other companies.

In order to relieve this situation, in 1920 the so-called cross-licensing patent agreements were entered into between the "radio group" and the "telephone group." The telephone group comprised the Western Electric Co. and the American Telephone & Telegraph Co., and the radio group comprised the Radio Corporation of America, General Electric Co., the Westinghouse Co., and other companies that held radio patents.

The Radio Corporation of America was incorporated on October 17, 1919. It was formed by the General Electric Co. for the specific purpose of taking over the patent business of the Marconi Wireless Telegraph Co. of America, a British-controlled concern.

In 1921, additional cross-licensing agreements were made between the telephone and radio companies. As a result of the 1920 and 1921 agreements, the General Electric and the Westinghouse companies obtained the exclusive right to manufacture radio receiving sets; R. C. A. obtained the exclusive right to sell radio receiving sets which were to be purchased from the General Electric Co. and the Westinghouse Co.; and the American Telephone & Telegraph Co. and the Western Electric Co. were granted the exclusive right to make, lease, and sell broadcasting transmitters.

In 1926 the cross-licensing agreements were modified whereby the telephone group granted the radio group the nonexclusive right to manufacture, lease, and sell broadcast transmitting equipment and thus relinquished its claim to the exclusive right with respect to such equipment. These 1926 agreements retained in the radio group the exclusive right of manufacture and sale of radio-broadcast receivers in the United States.

Digitized by Google

These so-called cross-licensing patent agreements are covered in chapter 8 of the Commission's final report on the telephone investigation.

On May 13, 1930, the United States Government filed a petition in the District Court for the District of Delaware against the American Telephone & Telegraph Co., the Western Electric Co. (telephone group), General Electric Co., Westinghouse Co., General Motors Corporation, and others. The petition alleged that the defendants were guilty of unlawful combines and conspiracy in restraint of interstate commerce in the manufacture, use, and sale of radio apparatus, and that the defendants were parties to certain contracts in restraint of such commerce in violation of section 1 of the Sherman Antitrust Act.

After the Government suit was filed, negotiations were carried on between the contracting parties and representatives of the Department of Justice looking toward the removal of the exclusive provisions of the contracts. Following these negotiations, a new contract was executed on July 1, 1932, which removed the exclusive provisions of the July 1, 1926, agreements. These new agreements were submitted in court, and by a stipulation of November 21, 1932, it was agreed that the suit be dismissed as to the American Telephone & Telegraph Co., and the Western Electric Co. (telephone group), and that the Department of Justice found no objection to the new cross-licensing agreements. On the same day, a consent decree was entered against the remaining parties to the suit enjoining them from enforcing the exclusive provisions ofthe cross-licensing agreements.

As I have before noted from the patent findings of the Commission regarding its investigation of the telephone industry, the cross-licensing agreements of 1932 do not represent a free exchange of licenses between the companies concerned in that the chosen fields of the telephone group and the chosen fields of the radio group are still reserved to the respective groups; that is, under the agreements, the telephone group retains exclusive rights under its patents in two-way telephone service to the public (wire and radio), while the Radio Corporation of America, General Electric, and other companies of the radio group, retain similar privileges in their respective fields.

Recent changes in the cross-licensing agreements have not in any way affected the rights ofthe respective radio and telephone groups.

Regarding broadcast receivers, the Radio Corporation of America has under these cross-licensing agreements a nonexclusive right to manufacture and sell and also the right to sublicense others. It is the only company of the two groups that has the right to sublicense others under the broadcast receiver patents of all the contracting companies. In addition, the Radio Corporation of America has the right to sublicense others under receiver patents held by others in the United States and the same right under United States patents obtained by a number of foreign concerns. It also has many patents which have resulted from its own developments. Therefore, it will be seen that the Radio Corporation of America has a very strong patent position in the radio-broadcast receiver field.

Under the cross-licensing agreements between the radio group and the telephone group, the Radio Corporation of America has the nonexclusive right to manufacture and sell broadcst transmitters under the patents of all the contracting companies and the right to sublicense others under its own patents, as well as the patents of General Electric and Westinghouse.

The Radio Corporation of America has licensed 52 or more companies for the manufacture and sale of broadcast receivers. It has licensed a number of companies for the manufacture and sale of transmitters under the patent rights I have previously defined. However, all the transmitter licenses limit the manufacture to transmitters for specific purposes. Also, in these license agreements for both receivers and transmitters, the Radio Corporation of America usually obtains a license under the patents of the licensee both as to transmitters and receivers and, in some cases, these agreements permit the Radio Corporation of America to sublicense others.

It is clear from what I have said that the Radio Corporation of America has a dominant patent position in the radio broadcast receiver field. It also has a very strong patent position in the transmitter field. There are, however, a few others that hold important patents in the broadcast-transmitter field under which the Radio Corporation of America does not have the right to sublicense others, such as the American Telephone & Telegraph Co., Maj. Edwin H. Armstrong, and Allen B. DuMont Laboratories, Inc.

The Commission's regulatory interest is principally in transmitters. Because of this conflict of patent rights in the transmitter field the Commission's efforts

Digitized by Google

to establish new broadcast services to the public are sometimes hampered. This was definitely illustrated in the case of high-frequency broadcast stations, commonly known as FM broadcast stations. It was also illustrated in connection with the Commission's consideration of transmission standards for television broadcast stations. If the legislation proposed by the Commission for common-carrier patents were extended to radio broadcast patents, this patent interference would be eliminated.

FOREIGN-PATENT AGREEMENTS

Chapter 8 on patents, of the Commission's final report on the telephone investigation (pp. 242–245) deals with foreign-patent agreements of the Bell System. The report indicates generally the terms of these agreements and the territories covered.

It can be said that these patent agreements are of two types, those dealing with patents relating to telephony and telegraphy, including cables, and those dealing with byproduct patents of the Bell System, such as sound motion picture inventions, etc.

Beginning in 1926 the foreign contracts of the Bell System were negotiated by the Electrical Research Products, Inc., a wholly owned subsidiary of the Western Electric Co.

In order that the committee might have an understanding of the type of foreign-patent agreements entered into by the Bell System, I have here produced an agreement relating to telegraph and telephone devices and another agreement relating to motion-picture sound films, which I have previously termed "byproduct patents."

The agreement as to telegraphy and telephony is that between the Electrical Research Products, Inc., and the Sumitomo Electric Wire & Cable Works, Ltd., of Osaka, Japan. The agreement is dated July 1, 1931, and terminated January 1, 1941. The agreement extended to the Japanese company a nonexclusive license for the manufacture of cables for telegraph, telephone, and other purposes, to be manufactured in Japan but not elsewhere, and to be sold throughout the world. There are a number of limitations and territorial exceptions to this general provision. The Japanese company, on the other hand, grants the Bell Co. (Electrical Research Products, Inc.) exclusive rights under its patents in the United States and Canada to manufacture and sell and use, and nonexclusive elsewhere. The territorial rights of the Japanese company are limited by 13 previous agreements with companies in other foreign countries set forth in schedule A of the agreement. The license provides for exchange of technical information.

Regarding foreign agreements respecting byproduct patents of the Bell system, I have here an agreement between Electrical Research Products, Inc., the RCA Photophone, and 10 United States producers and distributors of motion-picture sound film as the American parties, and 2 German manufacturing companies and 2 German distributing companies as the German group. This agreement was negotiated in 1930. The agreement covers all sound-film patents of both groups.

The territory covered is the entire world. In the contract the American companies were given exclusive rights in the United States, its Territories and possessions, Canada and Newfoundland, Australia, New Zealand, Straits Settlements, India, and Russia, while the German companies were given exclusive rights in Germany, including the Free City of Danzig, Saar Basin and the Territory of Memel, Austria, Hungary, Switzerland, and a number of other European countries. A nonexclusive license was extended to each group as to a number of South American countries and the countries not covered by the exclusive provisions.

The agreement also includes certain provisions as to recording and distributing which tended to eliminate competition in the countries where each group possessed a nonexclusive license.

On May 24, 1934, the American companies relinquished to the German companies their exclusive rights under the patents obtained by the German companies in the United States and also waived the provisions tending to restrict competition. This action on the part of the American companies was a result of the Department of Justice suit against the telephone group and the radio group regarding cross-licensing patents, with which I have previously dealt.

FOREIGN AGREEMENTS—RCA

The RCA Photophone, Inc., was a subsidiary of the Radio Corporation of America at the time it joined the Electrical Research Products, Inc., in negotiating the Paris agreement with the German companies regarding sound motion

Digitized by Google

picture patents. In addition to this agreement with the Germany companies the Radio Corporation of America has patent agreements with companies located in Australia, England, France, Germany, Holland, Hungary, Italy, Japan, and Russia.

The Commission does not have in its files complete copies of any of these foreign agreements. At the time the Commission made the telephone investigation the Radio Corporation of America was asked to provide information regarding its agreements with companies in foreign countries. The information furnished, however, is not sufficient to give this committee full information as to the terms of the agreements and the territories covered. I might also state that it is highly likely that a number of other radio companies in the United States have foreign agreements and that an investigation of the Radio Corporation of America agreements would not be in itself a complete picture as to radio patents.

EXHIBIT No. 132

GERMAN CARTELS

Statement by Heinrich Kronstein

I appear here in obedience to a subpena served upon me and upon my superior, Mr. Thurman Arnold, Assistant Attorney General. My subject is the development of cartels in Germany and their relation to patents.

For several years I practiced cartel law in Mannheim, Germany, representing numerous cartels in private negotiations as well as litigation in the courts. Since 1935 I have been in the United States. In addition to my work on cartels for the Alien Property Custodian and the Department of Justice, I also teach at Georgetown University.

My statement will be addressed primarily to the following questions:

1. Why did Germany become the homeland of the cartels and the principal exporter of technology?
2. What has been accomplished by and with the cartels in the different stages of the development?
3. What was the significance of patents in the development of the cartel device?
4. What was the effect of these cartels on state and society in the several stages of the development?
5. How did the German Government react to the development of cartels and the use of the patent device in the several stages of development?
6. What was the reaction of other countries to the German cartel and patent system?
7. How did Hitler utilize the cartel and patent system for the purpose of preparing for and waging the war?
8. How did he use especially the obligations assumed by firms outside of Germany, to German firms, for his purpose?

I am not going to answer all these questions, but I hope to contribute something to the understanding of the phenomenon under discussion. The statement as submitted herewith will not be read in full, but it may be useful as a reference in answering questions which may come up today.

I wish to express my deep desire to submit the material to you as impartially as possible and to leave it up to you to draw conclusions therefrom.

I. DEVELOPMENT BEFORE HITLER

Cartels and other forms of monopoly power may be considered from the point of view of their legal aspects, their internal organization, their relations to actual or prospective contractees, and to governmental authorities, or from the point of view of their economic aspects, effect on prices, wages, and salaries, production and distribution of markets.[1]

---

[1] Rudolf Callmann, with whom I had the pleasure of discussing the problem of German cartels at great length, defined a cartel as "a contractual association of legally independent entrepreneurs in the same or a similar field of business, formed with the intent, effect, or potentiality of influencing the market by means of regulation of competition" (Investigation of Concentration of Economic Power, hearings before the Temporary National Economic Committee, pt. 25, p. 13347) following thereby statements of the cartel cour.
This definition tries to be legal and economic at the same time. Is it helpful?

Digitized by Google

All these aspects have been analyzed again and again.[2] These analyses have one thing in common: They deal with a general type of "cartel and monopoly power." Their aim is to justify a judgment taken to be correct with regard to the entire subject matter.

This article only deals with the dynamics of the German cartels and other forms of monopoly power in a certain period, especially in the light of their repercussions on the outside world. Such a study is only worthwhile if free from the dogmatic method so often used in discussions of this problem with people believing in free trade as the only form of sound commerce, or with people convinced of the justification of a hostile attitude against capitalist leaders. None of these groups even try to understand the facts. The less prejudiced our study, the more forceful can its conclusion be.

Cartels are tools used to accomplish certain aims. They have no lives of their own. The people behind them give them life. The psychology of these people, their efficiency or laziness, their defensive or offensive spirit, together make up the spirit of the cartels. It is really amazing how the use of legal entities makes people believe that the legal entity has certain characteristics, while actually it can show just the opposite characteristics whenever used for different purposes even by the same people. In Germany, since 1879, cartels have been used for three purposes: (1) To satisfy the profit hunger of private business organizations; (2) to do this, but at the same time to win influence over the political and economic organization of the Nation on behalf of private interests; (3) to serve as a means of governmental, political power.

There is no legal or economic form of a cartel which would be wholly unfit to serve any of these three aims. A cartel regulating prices or conditions of delivery may be a powerful means of influencing, or even making ineffective, the tariff policy of a government. On the other hand, a complicated cartel with a joint sales agency, patent exchange and the like, may prove to be merely a means of obtaining additional profits. Therefore, a student of the dynamics of the German cartel system would not accomplish much by describing the several forms of a cartel.[3] He would find that the economic history of all countries in all times knows of many agreements between business organizations concerning prices, working conditions, and the distribution of markets. For the entire economic machinery such agreements become significant only as soon as they determine, in connection with other factors, in any way the economic and political structure of a country.

The specific intent of the people involved is of no significance. An agreement between two local banks to exchange a list of debtors, or to make identical conditions on loans, in itself has no monopolistic end. The banks want to prevent losses in case of insolvency of a mutual customer and to have the benefit of the best protection lawyers can furnish. As soon, however, as in the regular course of business no bank is open to this customer, from his point of view and therefore from the public point of view, the agreement between the two local banks becomes a monopolistic agreement. The public has an interest in a merchant who may tomorrow be at the mercy of the bureaucracy of a single bank organization.[4] This instance shows how a cartel agreement of the most simple form may develop into a cartel agreement influencing the public welfare. The general trend and the aims of the cartel are the only things which count.

The German cartel system developed under very specific conditions to accomplish very specific ends. Germany was the last western power to enter the industrial field. Until the legislation of the Zollverein made possible a sufficiently high tariff to permit the establishment of production plants, it was almost exclusively the customer for products manufactured by other nations. Friedrich List, who studied economy in the United States as well as Germany,

---

[2] The best bibliography of cartel literature is Arnold Wolfers, Kartell Problem Im Lichte Der Deutschen Kartelliteratur.

[3] Milton Handler, A Study of the Construction and Enforcement of the Federal Antitrust Laws, Monograph 58, Temporary National Economic Committee, p. 922.

[4] It is typical that the representative of the German banks at the cartel hearing in 1930 (p. 216) made the point that the government can have no interest in any cartel of banks providing uniform conditions of credit "since they do not contain any legal binding of the outsiders and have no intention of governing the market."

Digitized by Google

came to the conclusion that in both countries any industrial development was impossible so long as domestic industry was not given a chance to develop under what he called "an educational tariff." The basic statement of his conclusions is:

"History teaches us how nations by nature gifted with all means necessary to conquer wealth and power may repeatedly change their economic system to meet the demands of each stage of their development. They can overcome the state of barbarism by free trade with more progressive nations. After some time they may, by trade limitations, develop plants, fisheries, shipping, and foreign trade, and finally, in the highest stage, they may slowly return to the principles of free trade to protect their farmers, manufacturers, and merchants against laziness, and to induce them to maintain the acquired superiority." [5]

Although German trade and industry began to develop under the protection of the Zollverein, the real significance of the teaching of Friedrich List did not obtain much influence until much later. Most "economists" were opposed to Bismarck's tariff bill in 1879. They called such legislation a gift to the farmers and a deadly blow to the slowly developing German industry. They were in the good company of the chargé d'affaires in Berlin, who wrote to the State Department shortly before the enactment of the Bismarck tariff statute on February 15, 1879:

"The law levying restrictive duties on imported products meets with great opposition, and its injurious effect in a country which, like Germany, is able to produce so little of its own food and is dependent on others for the raw materials of its manufacturers, would seem to be self-evident. It is, in reality, a display without resisting the competition of cheap producers and manufacturers of the United States and Great Britain, and making up in a false way for the great loss of capital and labor in Germany resulting from the heavy drain on the muscular and mental resources of the nation caused by a huge standing army, and the doubt and loss occasioned in business by consistent continental wars and rumors of war. As the reports of our countries here show, much of the working capital of Germany is idle, and several branches of industry which supported whole districts * * * such as hop culture and the lead pencil, wood, and toy manufacture are becoming steadily of less importance and leaving the country altogether." [6]

On August 15, 1879, we find furthermore in one of the first reports of the new Ambassador, Mr. White, to the Secretary of State the following statement:

"There are some who see in the new protective tariff nothing but a necessary step to a reorganization of German industry. The idea appears to be that this industry shall exist for Germany alone; that the Government should protect it from foreign competitors, while it clothes itself in some new form of guilds with the object, of course, of improving the conditions of both operatives and employers. This policy of isolation as regards Prussia has increased since the military success of 1870 and, is further strengthened by the necessity the German Government causes itself in maintaining a huge standing army."

Mr. White realized the significance of the new "guilds," but he misunderstood their policy in viewing it as a policy of isolationism, when it was just the opposite.[7]

The export figures of Germany increased as never before. After this date, in almost every field German industry developed into the most powerful industry in Europe, whereas in 1876 the German commissioner on the Philadelphia World Exposition called the German goods "an exhibition of cheap and bad products." [8] England was suddenly confronted with a competitor, not only in the European countries outside of Germany, but in all parts of the world. Instead of many

[6] Papers relating to the foreign relations of the United States transmitted to Congress with the annual message of the President December 1, 1879.

[7] The only men who realized what the future would bring was the leader of the free-trade group, Ludwig Bamberger, who on May 3, 1879 (record of the Deutsche Reichstag, fourth period, 2d sess.) stated: "The consequences of high tariffs will be the resurrection of conditions sometimes called 'the union of industrialists'—the German sheet metal manufacturers—there are only six—are so sure of themselves that they already are building its union."

[8] Statement of the German commissioner in the Exhibition Rouleaux, quoted in Isay Die Auslegung 11.

Digitized by Google

figures, it seems to be sufficient to mention one instance. The export of hard coal out of Germany developed as follows between 1886 and 1905:

Year	Export	Year	Export
	Tons		*Tons*
1886	8, 655, 240	1896	11, 598, 757
1887	8, 781, 377	1897	12, 389, 907
1888	9, 460, 258	1898	13, 989, 223
1889	8, 847, 202	1899	13, 943, 174
1890	9, 145, 187	1900	15, 275, 805
1891	9, 536, 374	1901	15, 266, 267
1892	9, 649, 055	1902	16, 101, 141
1893	9, 677, 305	1903	17, 389, 934
1894	9, 737, 075	1904	17, 996, 726
1895	10, 360, 838	1905	18, 156, 998

This development, which was actually opposed to all theories of classical economists, was only possible because of the cartel device used in combination with high tariff legislation.[9] For instance, the mines entrusted the sale of all their coal to the Rheinisches Westfaelisches Kohlensyndikat,[10] a corporation whose shares were owned exclusively by the cartel members.[11] No sales to anyone else were permitted. The syndicate became the only buyer of the mined products and the only seller to the public. It paid to the member firms the same price, no matter to whom the product was sold. Coal which sold domestically in Bavaria for 17 reichsmarks was sold abroad in Austria for 8 reichsmarks. This was a typical case of the dumping practices followed by cartels. Four hundred and fifty cartels of similar structure existed in 1901.[12]

The most important instances of similar cartels can be found in the coal, iron, electrical, chemical, textile, rubber, timber, paper, glass, and building industries. The ways and means to regulate the export business and to distribute the profits in the domestic field and the losses in the foreign field was accomplished in different ways; e. g., the Oberschlesische Roheisensyndikat in Zabrzo (1901) provided in section 6 for the establishment of a joint sales agency, which however, should not sell in its own name but is agent of each of the member firms. At the end of 6 months prices were to be equalized with the result "that each member firm received the same proceeds for the iron delivered" (sec. 12).

The Stahlwerksverband A. G. Dusseldorf compelled all owners of steel mills to sell all their products to it. The price obtained by the Verband on selling the product was the basis of accounting with each member. The contract (1901) contains the provision (sec. 33): "An exporting plant shall have no better but also no worse position than it would have if all member firms had sold in the domestic and foreign markets what would be their theoretical quotas."[13]

In 1880 the Badische Analine und Soda Fabriken, Ludwigshafen, opened its research laboratory for the study of the industry manufacturing indigo dyestuffs. "Seventeen years of uninterrupted work was not too long to accomplish this end. In 1897 the first success was accomplished" (Carl Duisberg, Verwaltungsberricht des Deutschen Museums, 1910–11, pp. 40–41). "In 1888 the Elberfelden Farbenfabriken (Bayer) began the production of pharmaceuticals" (Carl Duisberg, Lebenserinnerungen, p. 66).[14] Dyestuffs and pharmaceuticals proved to be the basis of the development of the chemical industry. In 1902 the development of the dyestuff and pharmaceutical fields is shown by the attached table.

In 1882 the Continental Edison Co. of Paris granted Emil Rathenau a license to use its basic bulb patents, which became the basis of the establishment of the A. E. G.[15]

[9] Herbert von Beckerath, Der Moderne Industrialismus, Jena 1935, p. 367.

[10] The exceptions to this rule were in themselves quite important, but they should not be discussed here because they were not changing the general aspect (Compare Flechtheim, The Legal Structure of Cartels, 1910).

In 1905 the British Marconi Co. assigned the rights under the Marconi patents to Telefunken.[16]

Foreign inventions have been brought to Germany, improved, and used to a certain extent, as the basis of German exports. The opportunity given to German chemists to organize research made it possible to overcome the lack of raw material in Germany, at least to a certain extent, and for a limited period of time these research laboratories in Germany, made possible by high tariffs and the cartel system, became the most precious raw material Germany had.

In 1904 Carl Duisberg made the following statement to American chemists, which seems to be important enough to be quoted literally:

"If I have sung the praises of the American engineer and of the American mechanical industry in the preceding portion of this lecture, I must now express my satisfaction with the German chemist and the German chemical industry. In this field lies the strength of Germany, a consequence perhaps of the peculiarity of the German character. Forced by want of natural resources and unprovided with American abundance, the German in scientific exploration must proceed in a cautious and economical manner, always bent on patient and minute research. He is forced to live a simpler life and to be modest in his demands, which is contrary to the American temperament.

"It is true you have already a very important industry in the inorganic field of our science and produce large quantities of acids and alkalies and, above all, of metals. In consequence of the immense and cheap water power at your disposal, a very remarkable electro-chemical industry has been developed. But these works manufacture at present only inorganic products, and so far as I can see it is impossible up to date to manufacture organic products as economically by electrochemistry as it is possible with older chemical methods. You have also begun to isolate the products of tar distillation which are formed during the coking of coal, and it is intended to convert the hydrocarbons thus obtained into more intricate organic products. You have also the beginning of a coal tar color industry, due to the protective duty of thirty per cent ad valorem. I have also noted that in metallurgical and textile works, but above all in factories of heavy chemicals and pharmaceutical specialties, chemists exercise analytic control of the raw materials which enter into the process. At some places we found wonderful laboratories in which many chemists were employed. We saw above all how your universities and technical schools are endeavoring to promote our science. Excellent representatives of scientific chemistry are employed as teachers. Scientific research is carried on more and more.

"But, not withstanding all that, I think that we Germans need not be alarmed in the near future. The time for the development of the organic chemical industries on a large scale has not yet arrived. As I have shown before, the Germans are masters in manufacture where numberless products are employed in a series of reactions which finally lead to the finished product, and require manual labor, which cannot possibly be replaced by machinery, while Americans may claim to be masters where manufacture on a large scale is concerned, which can be done by machinery. Yet we must not leave out of consideration the very important facts that in America wages are extraordinarily high, that the conditions of life are here much more elaborate, and last but not least, that the employees, and more particularly the workmen, manifest a spirit of independence which has become especially noticeable during the last few years. By their labor unions the workmen attempt not only to raise wages to a height which will make manufacturing difficult and less profitable, but they are also endeavoring to take the control of the works out of the hands of the educated managers and put it into the hands of irresponsible labor leaders. This movement, as I have above shown, is especially fatal for the chemical industry in which our glorious science should be supreme.

"But nobody can deny that times will change in all these respects. Then you will be obliged to husband more economically your natural treasures, and you will experiences changes which with us, in the course of historical development, are already things of the past. But this accomplished, the organic chemical industry of this country will commence to flourish. It will be found that the only way that leads to success in chemical manufacture is a combination of science and technics, the two branches of which eminent representatives are to-

day assembled here, men who in their spheres have done so much already for the advancement of industries. It will be found that technical progress in this industry can only be secured on the basis of purely scientific research, and to the man who first recognized this fact and taught it to the world, to our great fellow countryman, Justus von Liebig, not only the German, but also the great American nation, nay the whole world, owes eternal gratitude." [17]

The immediate price to be paid by Germany for this staggering development seemed not too high from the point of view of the prevailing Prussian philosophy. The freedom of action of the individual disappeared more and more. Free competition, where it existed, became a fight for quotas in the future cartel, while the liberal economists in the universities closed their eyes and pretended to live in a period of free trade. Each device for the protection of the individual became unconsciously a device for control by cartel and monopoly power. The fact that freedom of action disappeared in the sphere of life in which it was supposed to be most predominant had its effect on the entire philosophy of every man, whatever his place might be in the Nation.

The patent statute of July 1, 1877, R. G. B. L., page 501 and following, granted a 17-year monopoly to the individual applicant for the patent in consideration of his making his invention public, and as a reward for his individual efforts in the interest of science. But Werner von Siemens, before the enactment of the first patent statute, praised the protection of the individuality of the inventor and the benefit society will have from such protection. No German patent statute up to 1936 [18] mentioned the inventor at all.

In 1900 Carl Duisberg [19] praised the right of the competitors to file objections as the basis of an efficient patent law and its application in the interest of the public welfare. He blamed the machine tool industry for not filing objections against patent applications often enough.

"Such protest alone gives the Patent Office a chance of a reasonable examination. The idea cannot be patented, even if it is worth a million. Only if the idea becomes an actual invention can a patent be asked for. If you are too lenient you do not help the inventor but you do harm the industry."

In 1901 Duisberg made the following statement:

"In Frankfurt you came to the rather strange conclusion that the fact that only 30% of the patents applied for were granted reveals wrong practices on the part of the German Patent Office. We chemists were in opposition to this resolution but the Patent Office met the request of the mechanical industry to a very large extent. The percentage of granted patents, which amounted to 36% in 1889, rose to 50% in 1899 and to 61% in 1900. I believe if they should go on the year 1901 will bring us 70 or 80% or even 100%, of granted patents. It is just horrible. Such a large number of doubtful and bad patents had been granted that many suits in our courts will follow. Furthermore, the Patent Office induced by the rather dark language of the amendment of the patent law and by the decisions of the Reichsgericht, adopted the practice of no longer setting forth the connections between the patent and another patent—I heard them even in the mechanical industry saying—'Dear Patent Office—Stop your gifts. Put on the brakes. You grant too many patents which should not be granted and which only do harm to the industry and do not help anyone.'" [20]

In 1902 Duisberg has this to say:

"You citizens in practical life will understand that you cannot define an invention by just counting your fingers. Processes for the common good of many chemists by which you get somewhat more exploitation of material or by which you can produce somewhat more pure products, shall not be closed to the industry by granting patents. Some of these processes are not more than a change of temperature or distillation of the product in vacuum, or of similar kind. That is done now continually—the statistics of the Patent Office show that the number of objections against patents increased very much, especially in the groups of the chemical industry." [21]

The same Mr. Carl Duisberg some years later, in 1908, said:

"In Class 12 [one of the two classes in the classification of chemical patents] 1860 patent applications have been filed and only 11 were contested. In Class 22 [another class of chemical patents] 1149 patent applications have been filed and only 5 have been contested. The reason is not that the chemical industry did not like to begin patent litigation but the chemical industry is tired. It does not like any more to be continually misunderstood. It does not like to wait for years until it can have a decision of the Supreme Court." [22]

Did Mr. Duisberg really believe what he said here, that the lack of understanding by the Patent Office, especially on the part of lawyers who were very much disliked by Mr. Duisberg, was the reason for the decrease of patent litigation? Did he forget the following: He himself began the exclusion of patent

[18] Statute of May 5, 1936, R. G. B. L. II, p. 1174 ff. The new patent statute provides (par. 36): "That the name of the inventor shall be mentioned in the application, in the publication, and in the patent certificate itself." This protection of the "honor of the inventor" did not change the principal use made of patents to serve as a means of monopoly. It is quite typical of the propaganda of the National Socialist Party to appeal to the individualistic rights of the inventor to give him a so-called honor—and at the same time not only to sustain monopoly powers of the entrepreneurs but to strengthen it to the extreme. The same thing happened in regard to the so-called destruction of the "Anonyme" business economy by corporations, promised by the Nazis, announced in a number of statutes—with the effect that today corporations and monopoly powers are stronger than ever before.

litigation between the dyestuff manufacturers by making a "peace treaty" in the entire field of dyestuffs with A. G. F. A. in 1889,[23] and with other dyestuff firms in 1904. There was no room any more for any kind of patent litigation in the dyestuff field.

Exactly the same development can be seen in the pharmaceutical industry, again under Mr. Duisberg's strong influence. In his very remarkable memorandum concerning the merger of the German dyestuff firms, submitted to all members of the boards of these concerns in 1904, he already mentioned the existence of certain agreements, and complained bitterly about attacks against the possibility of protecting by patents the manufacture of pharmaceutical products. "Who knows how long it will go until the legislators in Germany, Austria, England, and America will adopt the opinions already existing in the Latin countries to deny patent protection to pharmaceutical products and to processes for the manufacture of such products. The same opinion can be found in the trademark field. Influential groups try to abolish the possibilities of protecting trademarks for pharmaceutical products." Mr. Duisberg was very well aware of the tremendous power which this absolute security of big industry as patent owners amounted to, not only in the domestic market, where competition was absolutely excluded, but also in the foreign market, and not only for the period of the patent's existence, but afterward. In his memorandum of 1904 he stated proudly that no one could any more dare to offer any competition against the combined power of the combined firms. On July 24, 1906, in a speech in London, he stated:

"But you will see when the problems have been solved and when the patents have run out and the manufacture is free to every one, why shouldn't the English and foreign firms decide to cope with the German firms and compete with them again? In my opinion this would be futile and would be of no avail. Even in Germany where, as we have seen, the conditions are the most favorable, it would now be scarcely possible, or at least be a singular coincidence if the manufacturer, although possessed of energy and capital, should succeed in building up a new firm in the color line so as to successfully compete against the existing powerful works, and this applies even more to other countries."[24]

The same development with regard to patent litigation, which is in the opinion of Mr. Duisberg the basis of patent protection in the interest of the common welfare, can be seen in the electrical industry.[25] In its tremendous struggle as the owner of most European patent rights for use of Wolfram wire, the A. E. G. was supported by Siemens & Halske and General Electric. In the beginning more than thirty objectors against the patents appeared. It was one of the biggest patent fights since the patent statute was enacted. The fight went through the instances of the Patent Office and of the regular courts until the patent was finally granted. In the end an agreement was reached between all firms manufacturing bulbs to protect each other's patents, to exchange information and patents and to stop the fight.

Another case may show us the fate of an inventor who refused to join any kind of combination. I ask for the pardon of the reader if I tell the story of my own father. In 1901 he applied for the grant of a patent protecting a process to use tung oil, imported from China, for insulating varnishes. This patent application was the first application for a polymerization patent. The varnish industry realized immediately the tremendous importance of this patent and of the process for which protection was sought. The Association of the Varnish Industry, a corporation registered in Germany, together with importers and other manufacturers, filed objections against the patent. It went up through the divisions of the Patent Office. The inventor risked his whole property, and the property of friends as well, on the successful granting of a patent. The association applied to the Supreme Court but was unsuccessful. Later each member of the association filed a new suit in the first instances in the Patent Office, and again the case went through the courts, until the Supreme Court gave the patent to the inventor—just when the 17 years were over. The significance of the patent is shown by the fact that in 1903 the United States imported 2,998,000 pounds of tung oil, whereas in 1904 they imported 9,161,000 pounds. The increase of the import was a direct result of the invention.[26] The inventor became a chemist of very high reputation, but other people became rich.

All these instances show how between 1877, the year of the enactment of the patent statute, and the outbreak of the war, the German patent law was perverted; it became a means of monopoly control; private inventors who tried to use patents for their protection without giving in to the demands of the monopoly powers were defeated by the patent procedure.[27]

The development of substantive patent law went in the same direction. Herman Isay set forth a new doctrine of patent protection,[28] namely, that the patent protection should not be limited to the text of the patent itself but should cover any new process opened by the patent. For practical purposes Isay's distinction between the scope of the patent itself and the scope of the patent protection means that knowledge of the patent itself is not sufficient to establish whether or not a certain process is protected by the patent, or what shall be considered as new.[29]

An even more general principle than the patent field, the principle of individual freedom to do business, as provided in the "Gewerbeordnung" of 1300[30] had the same fate. The process of perverting the free economy was favored in a very fateful way by a shift in public opinion in disfavor of free competition.

The victory of the opinion considering free competition as a chaotic economy deprived the institution of competition of its character as a regulating factor in our economy. The conception of competition was defined by the courts in a thoroughly anarchistic way.

It is really astonishing how easily economic competition and institutions hostile to dictatorship were sacrificed to the private monopolistic trend. The liberal institution of competition was even handed over to the monopolistic powers as an instrument of the destruction of free competition.

The result of this development is that the principle of free competition has been transformed into the opposite principle of the senseless fighting between economic powers. Everything is permitted, even if it should be outside of the pale of business, and inconsistent with law or good morals. During the period between 1879 and 1914 the whole development was based on the decision of the Government and the Reichstag to enact a high tariff statute, and could have been changed by the Government in the same way.[31] The motion was at least a reminder to industry that the Government had the power to act. Here is one of the essential differences in the conditions before and after the First World War.

Patents could be influenced by the Government in the following ways:

1. By compulsory license.[32]
2. By governmental use of patents according to administrative decisions.[33]
3. By refusing compensation for use in the interest of the Government.[34]

Another element, however, in favor of the Government was its bureaucratic and military control of all that was going on in the country. The significance of the bureaucratic and military power of the German administrative machinery and of the social preponderance of the people connected with it, before 1914, cannot be overestimated. Although the groups in social life which were later to destroy the Government already were in the making, society did not develop

[27] The leading lawyer of big business in Germany, Herman Isay, was of other opinions. He called the patent policy a weapon of small industry (Isay, Hermann Die Funktion der Patente Im Wirtschaftskampf Berlin 1927).

[28] Isay Patentgesatz, p. 191.

[29] Besso's Limitation of Patent Protection, Zurich, 1934, pp. 13, 14.

[30] R. G. B. L. 1900, p. —.

[31] An amendment to the tariff statute was proposed by a member of the Reichstag, but was rejected. This proposal provided that import duties would be abolished "if syndicates, trusts, cartels, conventions, etc., should demand unreasonable prices in Germany." (Memorandum relating to Cartels, 1st part, p. 2.)

[32] The amendment to the patent statute of June 6, 1911 (R. G. B. L., p. 243), provided: "If the owner of a patent refuses to permit someone else to use his invention in spite of the offer of a reasonable fee and guaranty for the payment of the fee, the other person can be granted the permission to use the invention, if such grant is considered necessary in the public interest (compulsory license), and the permission may be granted with certain limitations or may be granted under certain conditions."

[33] Sec. 5, par. 2, provided:

"The patent has no effect to the extent that the invention shall be used for the Army, Navy, or in other ways in the public interest, in accordance with the determination of the Government. However, the patent owner is entitled to ask for reasonable compensation from the Reich or the state which applied in its interest for the limitation of the patent protection. If no understanding between the patent owner and the Government can be reached, the court may determine compensation."

[34] The court had no jurisdiction to decide about a case against the Government for infringement of a patent if the patent had been used to accomplish strictly governmental aims (Isay, par. 4, note 71).

the stage of "Pluralisme" in which private groups subordinate the national policy to its own interest and ends.[35]

How did the world react to this development in Germany? Very slowly, just as after 1933. The first reactions were patent reactions. The English statute of 1907 [36] provided the loss of the patent for nonuse.

The result of this measure was an increasing influence of the German industry in the economy of the British Empire itself. The then existing two large dyestuff groups (Agfa-Bayer and Badische-Cassella) acquired large terrains in England "which is fit to serve for plants for the dyestuff industry and even for the manufacture of all inorganic intermediaries or tar distillations." [37]

Duisberg seemed not too much concerned about the reaction to the German expansion. He said:

"We studied the conditions in all directions and we learned surprisingly that coal is much cheaper in England than in our country, that the wages for workers are much lower than in our country, that the taxes to be paid and the other governmental burdens are much lower than in our country. The only thing that is more expensive is the freight, which is not important at all." [38]

The United States did not follow the English example. It did just the opposite, it signed a treaty with Germany on February 23, 1909, providing:

"ART. I. The provisions of the laws applicable, now existing or hereafter to be enacted of either of the Contracting Parties, under which the nonworking of the patent, working pattern (Gebrauchmuster) design or model carries the invalidation or some other restriction of the right, shall only be applied to the patents, working patterns, designs or models enjoyed by the citizens of the other Contracting Party within the limits of the restrictions imposed by the said Party upon its own citizens. The working of a patent, working pattern, design or model in the territory of one of the Contracting Parties shall be considered as equivalent to its working in the territory of the other Party."

At this time the United States was in its development state. The desire to get the most modern products the world produced was so great that even the highest tariffs introduced by Congress did not prevent the German importers from bringing their goods in. The United States was not too seriously interested in the international market and in competing with English or German firms. The American firms found much bigger profits in using the natural resources of their country than they could ever hope to get out of the relatively small profits from production which required experience and expensive and risky research with strict organization.[39]

---

[35] The conception of "Pluralisme" is used first by Carl Schmidt, the analyst of Germany's constitutional law—who is highly gifted with intelligence but lacking character, and served all governments which Germany had after 1914 as a capable adviser.

[36] The Patent and Designs Act, 1907 (7 Edw. C. 29, sec. 27, 2d), provided:

"The monopolistic rights under a patent shall be deemed to have been abused in any of the following circumstances: (a) if the patented invention be one capable of being worked in the United Kingdom, and is not being worked within the United Kingdom on a commercial scale and no satisfactory reason can be given for such nonworking. (b) If the working of the invention within the United Kingdom on a commercial scale is being prevented or hindered by the importation from abroad of the patented article by the patentee or person claiming under him or by persons directly or indirectly purchasing from him or by other persons against whom the patentee is not taking, or has not taken, any proceedings for infringement. (c) If the demand for the patented article in the United Kingdom is not being met to an adequate extent or on reasonable terms. (d) If by reason of the refusal of the patentee to grant a license or licenses upon reasonable terms, the trade or industry of the United Kingdom or the trade of any person or class of persons trading in the United Kingdom or the establishment of any new trade or industry in the United Kingdom is prejudiced and it is in the public interest that a license or licenses should be granted. (e) If any trade or industry in the United Kingdom or any person or class of persons engaged therein is unfairly prejudiced by the conditions required by the patentee, whether before or after the passing of this act, for the purchase, hire, license, or use of the patented article or to the using or working of the patented process."

[37] Duisberg, Association of German Chemists, 1903, p. 1962 ff.

[38] Duisberg, Association of German Chemists, 1908, p. 1962 ff. Is it not interesting that Duisberg immediately used this opportunity to threaten his political adversaries by saying the following:

"Our high-tempered persons in the political field should be warned to be careful. For the time being we only intend to use our patents in England, which is at the present time important for use, and whereby England does not get a stronger position in the chemical field. All that the English newspapers wrote about this is exaggeration. We came with 2 chemists and 50 workers. What does that mean as compared with 500 chemists and 18,000 workers which we employ here? But let us be clear about that. The beginning is made and who knows what comes? England may enact a statute providing high tariffs. Under such circumstances we should be careful and not go too far in our social legislation in order to make more inconvenient for us the conditions of production."

[39] Duisberg, The Influence of Leibig on German Chemical Industry, Popular Science Monthly, April 1904.

Digitized by Google

An interesting attempt to resist the abuse of the patent system was made by Switzerland, which refused to give any chemical patents up to 1906. The German chemical industry was very much excited about this fact and urged the German Government to include a special provision in the commercial treaty between Germany and Switzerland requiring that Switzerland grant such patents. Interesting are the figures mentioned by the speaker for German industry. He alleged in 1902[40] that Switzerland established six or seven chemical plants "which manufacture in my opinion about 20 to 25 million francs of dyestuffs. Switzerland needs about 5,000,000 francs. About 15,000,000 francs dyestuff are exported out of Switzerland. The export of dyestuffs from Switzerland to the United States amounts to about 5,000,000 tons—even from Switzerland to Germany dyestuffs are imported." The speaker indicated that the import amounted to 3,000,000 francs.

The second reaction was the increase of import duties. Here the United States was leading, while England did not dare to leave its traditional policy of free trade because of extremely difficult problems which were bound to arise inside of the British Empire in connection with a high tariff policy. As high as the tariffs enacted by the American legislators may have been, the special provisions avoided any serious threat to the German policy as described above.

Duisberg[41] pointed out that the tariff policy of the United States did not affect the import of intermediary products which could be transformed in the United States by German-owned plants. He indicated that he did not expect a change of the tariff, but he clearly anticipated the day in which that might happen under other circumstances.

Another interesting example showing that the American tariff policy did not seriously affect the German development can be found in the production of pharmaceuticals. Duisberg's Memoirs (Leipzig, 1933, p. 88) mentioned that the import duty amounted to almost 100 percent without interfering with the German export policy.

The third reaction was to paralyze the German cartels by cooperating with them through international cartels. The cooperation was necessarily connected with the abandonment of the policy of dumping. This development of international cartels was still at an early stage of development and did not go too far before 1914. Interesting instances are:

(*a*) The chloride of magnesium cartel.[42]

(*b*) The bromine agreement.[43]

German industry could agree to join these cartels without giving up its general policy, because its production in these two fields had not the slightest difficulty in being sold, hence the expensive dumping process was unnecessary from the German point of view. In spite of the general interest which these early inter-

---

[40] Congress for Industrial Property in Hamburg, May 5–7, 1902, Record, p. 143 ff.

[41] Duisberg's Memorandum, submitted to the members of the boards of all dyestuff firms in Germany in 1904.

[42] This cartel had seven members which participated in the turn-over of chloride of magnesium in accordance with certain established quotas. If new members should join, all members had to give up the same percentage of their quotas. The cartel regulated production and aimed "to prevent overproduction and to bring in order offer and demands in accordance with the needs of the market" (report on the bylaws of this cartel in the memorandum about the cartels, p. 23). The cartel was at the same time a price-fixing cartel. The total turn-over of chloride of magnesium amounted in 1904 to 200,000 dozen. Most of this production was exported, especially to Great Britain, although Great Britain manufactured this article herself. It was very important for the German development that the sales to Great Britain were secured. Therefore agreements were made with the English producers providing that the English producers regulate the production in accordance with similar provisions.

[43] The brome agreement was connected with the chloride of magnesium convention by the fact that the members of both conventions were at the same time members of the potash cartel. The brome producers entrusted the entire sale to the Vereinigten Chemischen Fabriken zu Leopoldshall, A. G., in consideration for a payment of 1 percent of the turn-over.

While all brome was sold to the above-mentioned corporation in Leopoldshall, the brome derivatives were sold to an international cartel to which English, German, French, and Italian firms belonged. The management of this cartel was entrusted to the Vereinigten Chemischen Fabriken auf Aktien vorm E. Schering (predecessor to Schering Kahlbaum in Berlin, the parent corporation of Schering, Inc., of New Jersey).

These two international cartels represent two different types of international cartel organizations, since in the first cartel the production and prices of two countries are regulated by agreements between two cartels, while in the second form only one cartel existed whose sales agency distributed orders and profits. Both forms of the cartel are equally important for the purpose of avoiding dumping.

Digitized by Google

national cartels have, they are not to be considered as an efficient defense against all industrial oppression.

The international patent cartels in existence before 1914 had rather the aim of giving foreign corporations, which controlled an invention, access to Germany, than German firms access abroad. In 1883, in the electrical bulb industry, the system of exchange of information and patents developed which finally led into the so-called "Patent Interessen Gemeinschaft," on March 15, 1911. This association, of which the General Electric Co. was a member, guaranteed each member a free license under all the patents of all other members and the joint protection of these patents against any attack. Outsiders could only get a license if the association decided unanimously to grant such license. Since in this field the American development preceded the German, we are more interested in the American inventions than the German. A similar case could be found relating to radio patents. The Marconi Wireless & Telegraph Co., Ltd., an English corporation organized in 1897, controlled the patents relating to the use of radio on ships. Before 1911 Telefunken could not prevent Marconi from controlling the wireless even on German ships. However, Telefunken's research produced new inventions in other related fields, while Marconi became interested in participating in the German market in other fields than in the wireless telegraph field. Therefore Telefunken and Marconi agreed to exchange patents, which agreement was the basis for a very efficient world distribution system. Telefunken became a partner of Marconi in the Belgian Campagnie de Telegraphie Sans Fils, and a world-wide distribution of markets was in the stage of preparation when the First World War broke the contract for the time being.[44]

All in all the resistance of the outside world against the new German cartel and tariff system grew from year to year. At the same time German industry developed more and more. The clash between Germany and abroad became unavoidable. The German fortress from which goods could be sold cheaper throughout the world, became, in an increasing manner, an encircled fortress which in the final end could save its existence only by broadening its own field. The more immediate the danger of war, the greater became the significance of the Government as the best customer of industry.

In 1914 Germany entered the war as a nation which appeared to be unified to a degree never before seen, but as a matter of fact the Government was only the most powerful group among a certain number of groups which existed inside of the nation—the cartels, the unions, etc. The question was, how long could it remain the most powerful group, especially since the outbreak of the war deprived the Government of its most effective way of control, the control over the tariff policy. How long could the full outbreak of the crisis, the development of "pluralism," be avoided?

In the very beginning of the war the Government, directly or indirectly, as the largest customer could dictate conditions. But industry realized more and more that the Government had no choice other than to give in to the demands of the cartel and, to a certain degree, to the demands of the unions. Even if German economy had not made any real preparation for the war[45] Rathenau and Colonel Koeth, the organizers of the German war economy, nonetheless found ready the entire equipment they needed; namely, an organized economy which could easily produce a maximum of certain goods, restrict production of other goods, and replace some scarce products with newly invented substitutes. The whole machinery of the cartels, built up by private groups for the purpose of cornering markets, distributing profits, etc., which had been dependent on governmental policy, became for the moment the tool of the Government's war policy. The cartels were made the basis of all the so-called "war corporations." When these corporations were established it was not only intended to provide a supply of raw materials by seizure, but to purchase goods in the domestic market and to import other goods. All involved persons were accustomed to see products, orders, and profits distributed and divided.[46] Von Beckerath,[47] who had a very good chance to observe the activities of the cartels himself, made the statement that this above-described "war service" was very profitable business for the cartels and the industrialists behind them. The longer the war went on, the more the Government had to learn that it was absolutely dependent on the fullest

cooperation of industry, which was expected not only to produce but to substitute its goods to a very large extent.

In connection with the present discussions concerning certain artificial substitutes for raw materials developed in Germany but not used in sufficient quantity in the United States, I do not see any reference to the experiences which Germany had under the compulsion of the blockade of the last war. It is very interesting to read the report of Carl Duisberg about the war work of the predecessor firms of I. G. Farben. In reading this report we discover the basis of the development which became of greatest importance in connection with the present war.

(*a*) Rubber problem in the last war.[48]

(*b*) Nitre and nitrogen in the last war.[49]

---

[48] "An important question which interested us very much was the manufacturing of synthetic rubber. Many years before the war broke out we had already approached the problem as to how it could be arranged to manufacture a synthetic rubber to replace that found in plants in the tropics, which was so necessary to our industry. After many attempts we were successful, in August 1909, as a result especially of the work of Dr. Fritz Hofmann, in manufacturing synthetically a chemically pure isoprene. This product was produced from the derivatives of coal tar. Isoprene is a carbohydrate. This could be transformed into rubber by polymerization. This rubber was identical with the natural rubber, as the experiments of Dr. Harries proved. We were successful in transforming the higher homolog of isoprene, methyl isoprene or dimethylbutadiene, and the lower homolog of isoprene, butadiene, into two new forms of rubber. These two forms were elastic and similar to natural rubber, but different in several respects.

"Although we could not hope to manufacture isoprene as cheaply as the product obtained from natural rubber, we nonetheless began to manufacture methyl rubber, which was rich in carbohydrate, since it was much easier to produce and had a higher degree of homolog. This was done at a time when natural rubber was very expensive (20 reichsmark per kilo). Therefore it was not difficult to put the artificial product on the market.

"Experiments of the Continental Rubber Co. and Gutta Percha Co., in Hanover, made with methyl rubber to produce soft rubber, and experiments of Traun in Harburg to manufacture hard rubber, proved that we could already produce a product which was usable for certain purposes, although not equal to natural rubber. Therefore, we began to manufacture methyl rubber, and the Continental Co. in Hanover promised to use any quantity which we were able to produce. As far as we knew this methyl rubber was used exclusively, mixed with natural rubber, to manufacture tires. Tires which I myself made with this product proved that it was good and usable. For many years my cars had no other tires than this kind. They proved to be absolutely equal to tires made with natural rubber. The car of the Emperor was provided with tires made from the synthetic rubber of the Continental Co. After we had manufactured some 1,000 kilograms of this product and delivered it to the Continental Co., they observed that tires manufactured from a mixture of methyl rubber and natural rubber became old quicker, that is, deteriorated faster, than tires produced from natural rubber alone, if the tires were in storage longer than a year. In the meantime the price of natural rubber had decreased to 5 or 6 marks. Therefore no greater interest existed any more in the artificial product. The Continental Co. refused to take further quantities of our methyl rubber, and the manufacture of this product was suspended.

"On the other hand, the experiments in the research laboratory were continued without interruption, to improve the quality of the product and to decrease the costs of manufacture. We tried to use not only methyl rubber but also the two other synthetic forms of rubber. New experiments were made, together with some rubber companies in our neighborhood, especially with Clouth in Koln. We tried to use the different synthetic rubber forms for all purposes.

"When the war broke out we suffered from a lack of three raw materials necessary for the production of methyl rubber. Methyl isoprene (dimethylbutadiene) was being manufactured out of acetone by reduction with aluminum in the presence of mercury salt. All three products could only be used for the most urgent needs of the army. Therefore we had no chance to make methyl rubber. When, however, the war went on and the lack of rubber became greater and greater, we tried again to make use of methyl rubber. We began to produce it, using a very much improved process. Clouth in Koln found when they vulcanized methyl rubber which is easily affected by air, that 50 percent sulphur gave a hard rubber. Clouth used for this purpose 'Vulkacite' invented by us, to prevent oxidation. This hard rubber so manufactured was much superior in its electric resistance to hard rubber manufactured out of pure, natural rubber. The resiliency of methyl rubber produced by us was not inferior for certain purposes, even to the best natural rubber. Since the market broke down after the war, the continuance of this manufacture was no longer of interest for the industry" (Duisberg's Memoirs, Leipzig, 1923, p. 101 ff.).

[49] "A great problem solved by us was the problem of synthetic nitrogen. Before the war Badische manufactured, in accordance with the Haber and Bosch process, ammonia out of the nitrogen and hydro out of the hydrogen in the air. When the war broke out a plant was just being established for the production of 150,000 tons annually of ammonia. In the meantime Ludwigshaven began to double its plant.

"Since it was necessary to give our farmers as much nitrogen as possible, the production of calcium nitrogen in the plant in the neighborhood of Koln was raised to 120,000 tons. We had the Bavarian plant in Trostberg which produced 25,000 tons. Two new governmental plants were established in the Province of Sachsen and in Upper Silesia. The Reich made a contract with the Badische to establish a plant with a productive capacity of 150,000 to 180,000 tons of ammonia sulfate. This plant was established in the neighborhood of Merseburg and began work in 1917. This plant was called Lunawerk and was organized by Badische. Germany became selfsufficient in nitrogen before the war, although it had to bring to Germany more than 50 percent of its needs from foreign countries. A large number of new nitrogen compounds were being used as fertilizer, for instance, chlorammonium, ammoniunitrat, Harnstoff, ammoniasulfatsalpeter, Luena or Montansalpeter, Kalkammonsalpeter, Kalksalpeter, and Nitrophoska. Because of the needs of the war, German industry became independent in another field, the supply of sulfur" (Duisberg's Memoirs, p. —).

C. Metallurgical products in the last war.[50]

The Government had the power not only to grant compulsory licenses to firms interested in the field of these new inventions, but also to prevent the publication of any patent which might be important from the point of view of national defense. The Government did not use this power in many cases, especially so far as the big industries were concerned. No publication is available which gives us information on this point but I know of only one case in which the Government prevented the publication of a patent. In this case the inventor and the applicant were relatively weak.[51]

The two most efficient uses the Government made of its economic influence were the following:

1. The Government itself became a manufacturer, especially of aluminum. Research prepared by the Metallgesellschaft and Griesheim Elektron were utilized for the establishment of a large Government aluminum plant, which has remained under the control of the Government up to the present date.[52]

2. The establishment of compulsory cartels and the compulsory merger or closing of plants was brought about. Insofar as the industrialists could not agree in the organization of cartels, and the Government could accordingly not rely upon such cartels in certain fields, the Government established compulsory cartels compelling the industrialists to become members of this cartel.[53]

The practical history of the compulsory associations as established during the war shows, however, that it was not so much the Government command which regulated these compulsory cartels as it seemed to be. After the cartels were once established it could be quickly seen that the big industrialists inside the compulsory cartel had a more or less absolute leadership. Very often, if not in most cases, the suspicion arose that the compulsory cartels were only made on the request of the big fellows because of the refusal of one or another of the small industrialists to join.

There is no doubt that at the beginning of the war the Government had a very strong psychological position which was not used at all. In spite of all conservatism the Prussian militarists were very much influenced by the economic liberal theory that the Government should not interfere in business. The Government lost its chance very soon. From month to month a change in public opinion with regard to social classification could be seen. Public opinion, even in the groups of militarists themselves, considered a "Wirtschaftstuehrer" as the type of person replacing the generals and high officials in the social classification. The ideology of the Government had nothing to offer against the demands of technologists, industrialists, and financiers. Walther Ratheneau made the only attempt to give an ideological basis to the fact that industry and business had to devote themselves to the aim of the Government in time of war. Ratheneau, who organized the German war economy to a very large extent, established for the first time the character of an enterprise as a kind of public

---

[50] "I do not like to finish this chapter without discussing the success of chemistry in the metallurgical field, where chemistry opened ways which seemed to be very difficult. For instance, manganese is not only important as a means of alloying in the preparation of steel, but it is also important for use as a means of deoxidation. Many experiments were made to save manganese as an alloying material and to substitute it as a deoxidation means. Very soon we learned to save manganese. Calcium carbide was discovered as a full substitute for manganese in connection with deoxidation, and thereby we cheapened the manufacture of steel by 8 pfennig per ton. The large increase of the price for nickel and chrome made it possible to utilize mines in Germany which could not be utlized earlier. The Stahlwerke Richard Lingenberg in Remscheid introduced steel which was poor in nickel for these purposes. With the help of electro-steel ovens wolfram would be substituted for molybdenum. The best mine for molybdenum oxide lead was found in the neighborhood of Garmisch in Bavaria.

"To make us independent of foreign countries in the field of aluminum, three plants were established in Germany at places at which electrical power was cheap and ample. These plants supplied the entire German needs of aluminum. We used in the beginning Hungarian bauxite as raw material, and later German clay.

"In Bitterfeld a new plant for the manufacture of a new metal, just discovered, was established. This metal, called "electryon," was made out of magnesium alloyed with manganese and aluminum. This metal was manufactured out of a byproduct of phosphate salt fabrication of chlorine magnesium. Electryon was a very good substitute for aluminum" (Duisberg's Memoirs).

[51] The patent involved dealt with the substitution of fats and oils in printing.

[52] In the above-noted information of Duisberg about artificial rubber (Review for Electro-Chemistry, 1918, p. 369) we find the following statement:

"A new big plant for the production of aluminum will be completed very soon. This plant will not use foreign bauxite but German clay, wherefore we will now be independent from foreign markets in the field of acetic acid and also in the sale of aluminum, and even in peace we will be able to substitute large amounts of imported copper by domestic aluminum."

[53] The idea of compulsory associations was not unknown in the German law. Such compulsory organizations were known for quite a long time, as for instance, fishery associations.

Digitized by Google

good, subject to the commands of the Government, which alone can be responsible to the national state.[54]

When the war was over the development can be understood more easily if we have in mind the following facts:

1. German industry lost its foreign subsidiaries, patents, and foreign property (art. 238, 243 Versailles Treaty).

2. Other countries could freely establish high tariffs while the German Government lost its power to regulate tariff legislation independently.

3. German industry was confronted with a large number of new European states, such as Poland, Czechoslovakia, Jugoslavia, etc., which had all new tariff borders and tried to become self-sufficient as much as possible.

4. German industry had to import raw materials which, up to 1918, it had in its own territory, especially zinc, which had now to be imported to a large extent from Upper Silesia, which was under Polish jurisdiction.[55]

5. German industry, on the other hand, had a very much greater capacity than it had before the outbreak of the war, because during the war new plants, technical processes, equipment, etc., were established, without any consideration for future economic development. The same happened in other countries, which up to the war sent their raw materials to Germany to have them transformed into finished products.

6. The Government itself lost not only its tariff power but also its social standing. The industrial class prevailed in the social structure of the nation.

7. The Government had to rely upon industry in connection with the performance of many provisions of the peace treaty, for instance, that requiring the export of a certain amount of coal dyestuffs to the victorious countries (Versailles Treaty, art. 232), which provision could only be performed by the entity of the dyestuff industry.

8. The German Government had to rely upon industry in the problem of demobilization and of transferring the returning Army men to jobs in industry.

9. The Government lost its position as the largest customer for armament purposes, and could not reestablish this position.

Two outstanding events made the situation much worse. First, the inflation: While the government could not cancel its foreign debt, and while its domestic debt reappeared almost immediately, especially the debt connected with the peace treaty, industry undertook to cancel its own debt by the inflation policy. During the inflation the industrial merger movement developed very fast. The statistics relating to corporations in the time of inflation does not give us any true picture, because of the establishment of business organizations which were practically without foundation. The increasing number of corporations revealed by statistics does not make clear the fact that during the inflation period the control of the entire German corporation capital began to be confined to an always decreasing number of people. In this connection it may be stated that according to the statistics of 1940 the management of 170 German corporations controlled 56 percent of the entire German business capital.[56]

Second, the threat which existed during the whole inflationary period that a merchant might lose his entire capital by selling his products for paper marks without regard to the repurchase costs, became the basis for the cartel agreements between producers, wholesalers, and retailers, which will be discussed later on.

The worst immediate effect of the inflation on the German economy was that industry, which already had a capacity much exceeding any possibilities of a regular German market, increased its technical capacity to a very large extent. Then came a period of rationalization—and again German capacity grew to a never expected efficiency, with the help of American loans.

After this was accomplished the crisis began, for there was practically no idea as to what to do now with this tremendous industrial power.

Any student of the cartel situation, especially with regard to patents, should understand this development above discussed, and its effect on the relations between government and industry.

Pre-war history, the development during the war and this last development established a complete domination of German economic life by the industries which used these devices: The monopolization of products, the patent monopoly

power, and predominant capital power. In all fields in which any group could exercise one of these powers the industrialists, after they completed their own cartels, informed the wholesalers that they would only be supplied if they became members of the wholesalers' cartel, and the wholesalers informed the retailers that they would only be supplied under the same conditions as those under which the industry supplied them. A typical example of the conditions in a field in which the production was monopolized is the association of German screw and nut producers. This association made an agreement with the association of screw wholesalers. Section 2 of the bylaws of the association of the wholesalers reads as follows: "The purpose of this association is the regulation and improvement of the German screw business, especially the fixing of prices in the screw trade and the performance of eventual contracts to be made with the association of German screw and nut producers Düsseldorf."

No member of the producers association (and there was already in 1929 no producer not included in the cartel) could supply any wholesaler or anyone else who was not a member of the trade association. The agreement between the two associations regulated the kind of products to be sold and the price and conditions of delivery, not only between manufacturers and wholesalers but also between wholesalers and retailers or any other kind of customers.

There was already after the inflation practically no field in the coal, iron, steel, or metal industries in which the producer had not an absolute control over the sale of the products, beginning from his plant up to the last consumer.

It would not serve our purpose to describe many instances of these contracts. However, it may be referred to decisions of the cartel court which described typical situations in which businessmen came into this cartel.[57]

A case typical of the second situation, the monopolization based on patent power, is the case of Telefunken. Telefunken controlled the so-called Fleming patent DRP 186,084 relating the the protection of cathode detector tube and electrode tube, and patents relating to the circuit.[58] That gave Telefunken, up to 1941 a subsidiary of Siemens & Halske and A. E. G., an absolute control over the radio industry, wireless industry, and all enterprises manufacturing medical equipment using such devices (for instance, equipment to examine heart activity and auditory disturbances). In the field of radio the Government induced Telefunken to give a certain number of licenses. However, from the very beginning, the grant of any license was dependent on the joining of a cartel. Whereas the full effect of this system did not become clear before Hitler came into power, the transformation of the associations of the radio industry and the radio trade by the National Socialist Government amounted to a subordination of an existed commercial system under the political command of the party. The regulation of the market was accomplished before Hitler, as a market regulation by patent, effective from the manufacturer to the last consumer. That could be accomplished although the patent refers only to a relatively small part of the sold product.

The National Socialist Government was so much concerned about the fact that one of the important Telefunken patents came to a natural end that the Government by decree provided that the patent "market regulation" shall continue.[59]

As far as other uses of the tubes were concerned, it was extremely difficult to get any kind of license from Telefunken. I tried myself, on behalf of a client who had a very excellent reputation as a scientist, to get a voluntary compulsory license for the manufacturing of equipment for testing the human hearing. The only success was that Telefunken itself brought the article on the market.

The German monopoly situation has been discussed only too often[60] in connection with the I. G. Farben case. This case may be classified between the group of monopolization by patents and the group of monopolization by capital power. The chemical industry began more and more to apply for a patent on practically everything. The research laboratories of the few remaining chemi-

[57] The cartel court is organized in accordance with the provisions of the cartel decree of 1923. The cartel court was abolished in 1940 and its tasks were entrusted to the Reichswirtschaftsgericht. The jurisdiction of the cartel court or of the Reichswirtschaftsgericht exists, for instance, in cases in which a member of a cartel alleges that the continuance of his membership is inconsistent with public interest and cannot be expected.

[58] Otto von Bronk, Telefunken Patents—Twenty-five Years Telefunken.

[59] Kartell Rundschau, 1939.

[60] Some people may be inclined to believe that I. G. Farben is the only case.

Digitized by Google

cal works which were connected among themselves by cartel and working agreements, studied systematically entire fields and closed them by a large number of patents. That was true in the development of plastics (the participants were I. G. Farben and Röhm & Haas), and in most pharmaceuticals (in which three groups of enterprises participated: (1) I. G. Farben, (2) Merck and Boehringer Knoll, connected by joint sales agency and agreement relating to the exchange of information, etc., (3) Schering-Kahlbaum, A. G.). Each publication in any chemical review or each patent application of any applicant in any country is given to the staff of the research laboratory to find anything that can be patented, no matter if the patent is a patent of evasion or supplement or protection against other inventors. But in fields in which the patent situation had theoretically permitted to build up competition, the factual power of the capital investment made such attempts impossible.

The capital to be invested to build up efficient plants in the field of the heavy industries and the chemical industry, as well as in the machine and metal industry, became so tremendous that only very rich groups could try to go into any of these fields. As soon as a plant was completed, as for instance the nitrogen plant in Leuna or the plant of the Vereinigte Aluminumwerke in Lauta, a competitive plant would be not only a disaster for the new entrepreneur but also for the old entrepreneur and for the public. Therefore, no bank participated in bringing out money for such purposes. The Vereinigte Aluminumwerke obtained a patent relating to the manufacture of aluminum out of clay in 1919. If it had tried to use this patent its just completed plant would lose its value, therefore the Vereinigte Aluminumwerke gave a license to its Italian subsidiary, but did not use this patent until a number of years later.[61] The monopoly powers based on patents on capital used the same device of binding the wholesalers and retailers and of control of the last consumer as the above described cartels did.

So we learn that the Government was confronted with the fact that the entire production and market conditions were regulated by the management of a number of corporations which from year to year either decreased or became dependent on each other. What does it mean if we say that the Government took care of the domestic policy of the nation, whereby production and market was regulated by monopoly powers and the wages and salaries by the unions of labor and employers? The industry was confronted with the problem which Hitler later expressed by the statement: "Export or die." At this time not the German offensive and the foreign reaction thereon had to be studied, but for the time being the situation was reversed. The outside world, including the new states, acted first, by high tariffs, by depriving Germany of her tariff power, by a license system for imports, for doing business, and for establishing subsidiaries, by seizure of patents, trade-marks, etc.

None of the devices used by the German industry before the last war could help. The only governmental measure or policy which helped was the agreement between Germany and Russia relating to the financing of German goods to Russia. German industry did not have any other chance but either (*a*) to find loopholes in the exclusionary system of the world for whatever reasons these loopholes may exist; (*b*) to find help from "within" the outside world.

These two ways can be shown by two interesting instances of the chemical industry.

America excluded German dyestuff and chemicals after peace was reestablished, by the Dye and Chemical Control Act of 1921,[62] which provded in paragraphs 27 and 28 the following:

"If there is no similar competitive article manufactured or produced in the United States then the ad valorem rate shall be based upon the U. S. value as defined in subdivision (d) of sec. 402, Title 4. For the purposes of this paragraph any coal tar product provided for in this act shall be considered similar to or competitive with any imported coal tar product which accomplishes results substantially equal to those accomplished by the domestic product when used in substantially the same manner."[63]

If there is any competitive article manufactured or produced in the United States the import duty is much higher.

The German industry learned to use this provision for its own benefit in two ways:

---

[61] ———.
[62] 42 Stat. 18.
[63] This provision has been taken in the Tariff Act of 1930.

1. *Nitrogen.*—On July 11, 1930, the manager of the nitrogen plant of I. G. Farben made the following statement in the committee of the German Reichstag investigating the structure of the Germany economy:[64]

"Serious endeavors to manufacture synethetic ammonia have been made in the United States, France, England, and Italy since 1917. However, before the armistice, only in the United States was a plant built up, after the chemical foundation sold licenses on the German nitrogen patents of the Badische Aniline Soda Fabriken. On the request of the government the General Chemical Company began to build the plant in Sheffield on the Tennessee River in 1917. The plant was called "Nitrate Plant No. 1." It was intended to put this plant in operation in June, 1918. However, up to the present date no regular production has been taken up. The process which was supposed to be used was prepared by the General Chemical Co. This process was distinguished from the process used in Oppau by lower pressure and by the use of catalizers, which however, were already described in the patents of the Badische Aniline Soda Fabriken. During the last years the Nitrogen Engineering Corporation, a subsidiary of the General Chemical Company, established plants on the Niagara River and in Peoria, Illinois. All these plants including plants which were supposed to use a process developed by the Fixed Nitrogen Research Laboratory, Bureau of Soils, Washington, using a process very similar to the Haber-Bosch process; some of these plants close especially because of a lack of profitability. Other plants were transformed into plants manufacturing other products. The plant of the Niagara Ammonia Corporation has been sold to the Dupont concern in the spring of 1927 and closed down immediately after the sale. In the plant of the Commercial Solvents Corporation in Peoria the hydrogen is now used for the purpose of manufacturing 'methanol'."

This allegation of Mr. Bueb could not be investigated, but his allegation practically amounts to a statement that nitrogen has not been produced in this country in spite of the seizure of the patent. The often alleged excuse that it could not be produced because the patents did not describe the process sufficiently is verified by the following statement of Mr. Duisberg:[65]

"The military control commission demanded that we shall not only inform it about the processes used for the production of powder, explosives, and gas, which we certainly did in pursuance with the peace treaty, but that they also be informed about the processes by which we manufactured raw material, such as nitrogen acid, ammonia, and sulphuric acid, which are the basis of every chemical production plant. Thereby the businessman of the entente intended to be enabled to produce peacetime products as cheap and as good as we did before the war.

"We were required to give to the entente the processes in all peculiarities, with drawings. We were requested to inform them how our heatings were constructed, etc. They demanded that we inform them how we produce sulphuric acid out of plaster, and how we produce cement as a byproduct. Our cement was superior to any cement in the world, since it was about 50% stronger. Furthermore, we were required to inform them how we made nitrogen after we were separated from Chile and could no longer import any Chilean nitrogen. We were requested to inform them even of our unsucceesful attempts to transform ammonia into nitrogen, to help them from following the same erroneous ways we went through until we were successful. That was not enough—they wanted to have more. They wanted to know the Haber-Bosch process for the manufacture of ammonia out of the nitrogen of the air and hydrogenation. It is obvious that had nothing to do with explosives or with war, but it had to do with our manufacture of fertilizers. These demands came only to make economic profit."

The German Enqueteausschuss III contained on page 188 a list of the import duties to be paid for nitrogen manufactured by Leuna (I. G. Farben) in the different countries. This list states that the import to the United States is free, under position 1583, in accordance with paragraphs 27 and 28 of the Tariff Act of 1922 as quoted above. So the loop-hole was found to bring nitrogen in the United States.

After 1923 the German processes were improved to a very large extent and new patents in this field have been taken out.

The import in this country was entrusted to the Synthetic Nitrogen Corporation which was under formal control of an American friendly to I. G. Farben interests.

2. *Dyestuff.*—The Alien Property Custodian of the last war was especially active in regard to dyestuff corporations. He repeatedly stated that the German dyestuff monopoly is of extreme danger to the safety of the United States. Therefore he answered in the Senate committee the question if the German dyestuff firms should be excluded forever, very much in the affirmative. On February 3, 1919, he sold 558 patents and 1 trademark belonging to the Elberfelder Farben Fabriken Bayer & Co. to Sterling Products Co.[86] The dyestuff patents of other firms were sold to the Chemical Foundation, Inc. These two groups of patents came back under the control, or at least strong influence, of the predecessers of I. G. Farben. The dyestuff patents sold to Sterling were not of real interest to Sterling Products, which was only interested in pharmaceuticals. Sterling Products sold its dyestuff interests to Grasseli Chemical Co. In 1924 the Grasseli Chemical Corporation came to an agreement with Elberfelder Farben Fabriken Bayer & Co. and another predecessor firm of the I. G. Farben, the Farberwerke vorm. Meister Lucius & Bruning. In accordance with this understanding the Grasseli Chemical Co. assigned all dyestuff patents to a new corporation, the Grasseli Dyestuff Corporation, to which Bayer assigned its present and future United States patents and trade-marks relating to the manufacture of dyestuffs, granted or applied for after the end of the war. Bayer acquired an interest of 50 percent of the dyestuffs while Grasseli kept 50 percent. Later the so-called Hoechster Farbewerke acquired a subinterest under Bayer. In 1925 the participation in Grasseli Dyestuff Corporation was changed when Grasseli Chemical reduced its participation to 35 percent, Bayer reduced its participation to 30 percent, while the rest was assigned to H. A. Metz as trustee for Hoechster Farberwerke and to other predecessor firms of I. G. Farben. In the same year this company became the exclusive selling agent in the United States for all dyestuffs of the I. G. firms. The personnel of the General Dyestuff Corporation was obtained by combining the dyestuff sales personnel of the Grasseli Chemical Co., which was taken over by du Pont, with the dyestuff personnel of the firm H. A. Metz and Kuttroff Pickardt & Co. Grasseli changed its name to General Dyestuff Corporation, which was optioned to I. G. Farben in 1926. In 1928 I. G. Farben acquired all the shares of General Dyestuff Corporation and the name was now changed to General Aniline Works.

The second line by which the German dyestuff corporations returned in the American market was the following: "the president of I. G. Farben, Dr. Bosch, made a statement in the German Enqueteausschauss (p. 121) which indicated the payment of royalties on patents formerly owned by German firms, to the Chemical Foundation Co. by the I. G. Farbenindustrie." This statement has obviously the following facts in mind. The Chemical Foundation issued an import license after the War Trade Board had given its consent, to Kuttroff Pickardt Co., Synthetic Nitrogen Products Corporation, General Dyestuff Corporation. Kuttroff applied for licenses on certain of the patents of the Chemical Foundation, all of which were granted: Patent Nos. 1,232,551, 1,232,552, 1,201,850, 1,251,954, 1,342,790, 1,344,671, 1,391,664, 1,082,719.

These licenses in conjunction with the above discussed devices opened the way for the import of important German dyestuffs.

These two devices show how the German industry came back in regard to new patents and in regard to old patents.

As soon as that was accomplished the manufacturing plant of the General Aniline Works had the immediate effect to exclude any other foreign competitor, for instance, Swiss competitors, by the above-mentioned tariff provision of the American tariff act. Other domestic competition could be excluded by patents newly taken out for dyestuffs.

Here we have the basis for one of the most important devices which gave the German industry a chance in spite of all exclusionary legislation: the establishment of subsidiaries which had all benefits provided for domestic corporations by exclusionary legislation. Any kind of exclusionary legislation worked now in favor of the German subsidiary.

In 1932 the Imperial Chemicals joined the German-Swiss-French cartel, whereby the entire front outside of the United States was consolidated.

This international cartel controlled within the United States the following subsidiaries in the dyestuff field: General Aniline; Ciba, Inc.; Sandos, Inc.; Geigy, Inc.; and Cincinnati Chemical Corporation. They controlled furthermore in almost every Latin American country sales agencies of great importance,

[86] See Report of Alien Property Custodian submitted to Senate, 67th Cong., 2d sess., Doc. No. 181.

Digitized by Google

and several manufacturing plants. Although the American subsidiaries did not become, as a matter of form, members of the cartel, they were put under active control and had to follow instructions of the management of the cartel members. The principle of instructing subsidiaries was strengthened by the use of the patent system. Since the cartel firms had patents in each and every country of the Americas it has a patent system that could exclude the United States subsidiaries from the Latin American market just by assigning only the American patent to the subsidiary, wherefore the subsidiary would violate the patent granted in another country to another firm if it ever would supply any firm outside of the United States without the permission of the patent owner. This form of international cartel is directed against the interest of the United States from without, using the subsidiary device and the patent device as means from within.

In other kinds of international cartels the situation is different. If the German position was not strong enough, neither to prevent the establishment of any plant in the United States and thereby to use all benefits granted by the United States tariff legislation, nor to exclude foreign and American competition by establishing subsidiaries in this country, they had to look for an American enterprise which was interested in those patents, either because they had other patents which could be made much more useful and valuable by exercising the license of the German patents, or which were afraid of the use of these patents in this country as a competitive means against their own products, and would be willing to pay substantial amounts of money either to participate in the German patents or to exclude them or to exchange their own patents for the German patents. In this situation another form of international cartel was established. An interesting instance is the electric bulb production. As we learn above, already before the outbreak of the last World War a patent association existed which made it, as a matter of fact, possible to exchange all General Electric patents with all patents of other electric bulb manufacturers. This system was reassumed as soon as the last World War came to an end. At the end of 1924 the entire world electric bulb production outside of the United States was formally cartelized by two agreements:

1. General patent and development agreement.
2. Agreement establishing the Phoebus S. A. (Compagnie Industrielle pour Le Developpment de L'Eclair A. G.) it being just in the same form as we learned it in connection with the first German cartel Rheinische Kohlen Syndikat.

We learn that the Phoebus corporation has to guarantee to a certain extent the distribution of markets, the standardization of products and restriction of production. The fact that the United States is not a member of this cartel because of the antitrust legislation did not impress the president of the German electric bulb company, Osram G. m. b. H. K. G. He made the following frank statement:

"When we made this contract (the world cartel) we were already confronted with a large system of license contracts by which the manufacturers came in closer connection with each other and by which their markets have already been distributed and their interests equalized. Especially we had already very extensive collaboration agreements with the American firms by which mutual patent protection has been obtained and by which also in a territorial aspect a certain distribution has been reached. Therefore we have no reason to be excited about the American law discussed by Dr. Isay (who just had spoken about the American antitrust legislation before Mr. Meinhardt, chairman of Osram, took the floor), but we could use all agreements with the Americans which are made on perfectly legal basis, namely, as patent license agreements to accomplish the now intended aim of the distribution of markets." [67]

The participation of one American enterprise in a world cartel mostly using the device of patent exchange became a very common one. However, the full

[67] Wilhelm Meinhardt in the Kartell Stelle of the German Association of Manufacturers, 1929.
Mr. Meinhardt did not make this statement as a mere "lapsus linguae," since in his book on the development of the structure of the electric bulb industry (Berlin, 1932) he made this statement (p. 105):
"It is of special significance that our old collaboration agreements relating to the exchange of inventions and experience which were made between the American and the other enterprises were a good basis even as far as American law is concerned, since the reservation of certain countries for exclusive supply was based on a lawful basis. The world agreement could therefore be certain not to be attacked from the American side. The old agreements were on a sufficient basis to accomplish the aim of the distribution of the markets."

Digitized by Google

consequences of this device did not become clear before Hitler came to power, wherefore its destructive character from the point of view of American security shall be discussed later on.

The only case in which it came to more than a cartel agreement, to a partnership, was the Standard Oil-I. G. Farben case.

Carl Bosch, the president of I. G. Farben, described the purpose of this agreement in the following way:

"In the field of the hydrogenation of coal our position is not easy. Therefore we try to find out the means to cooperate with the big American oil concern, Standard Oil Co. of New Jersey. The field of petroleum industry is so tremendous and is so absolutely under the command of three large concerns that the consideration of a new production in the fight against these concerns would have been very difficult.

"In the nitrogen field the conditions were quite different. When we began to produce nitrogen we knew that we could obtain a certain profit rate, using the available technical equipment. However, in the field of hydrogenation of coal we knew from the very beginning that we needed many years only to decide the question up to the price limit we could compete. Even if we did decide this question we had to spend tremendous amounts of money to transform the experiences made in working with small quantities in a production manufacturing large quantities. The problem of obtaining liquid fuel out of coal is extremely important and its solution is in the national interest. If we had been compelled to fight against the large petroleum companies the financial needs would have been beyond any expectation.

"Therefore, we believed it best to come to an agreement with the petroleum concerns. These concerns have not only a small interest in our process. That is especially true as far as heavy raw oils are concerned, which were used in increasing manner, since the light raw oils are not any more sufficiently available. The turn-over of light gasoline increased very much compared with the total production of oil. At this point our process comes in, since it is possible with our process to transform the heavy raw oils which are easily available into a condition in which they can be used just as the light raw oils up to now. Furthermore, the oil industry has to keep in mind that the natural sources of oil may come to an end, in spite of the fact that we have now an overproduction of raw oil.

"Therefore we made an agreement with Standard Oil relating to the use of our process, to use raw oil in the United States. Our joint research work which was the basis of the establishment of large research plants in three refineries of Standard Oil in the United States proved quite soon that this agreement has to be amended in territorial and in substantive matter. The business of Standard Oil is not limited to the United States but covers all countries of the world. Therefore, it proved to be impossible to develop new processes to use and refine oil and its products in the United States but to restrict the foreign subsidiaries of Standard Oil from using these processes. In a substantive point we learned more and more that we gave important experiences of our coal and tar hydrogenation out of the hand by giving information about hydrogenation of oil, since very close connections exist between these two processes. Relating to the coal hydrogenation which is of importance for Standard Oil, especially in regard to countries which have cheap coal but no natural oil resources, it will become more important for Standard Oil as soon as the natural oil becomes scarce. In regard to this process, however, we had no agreement.

"To meet this situation and to make sure that our processes will be developed with the greatest possible profit, we decided in 1929 to establish a holding company, together with Standard Oil, the Standard I. G. Company, and to assign to this company the right of using all our patents in the field of hydrogenation in all the world outside of Germany. Standard Oil promised to bring in its patents in the same field. We intend to permit not only Standard Oil and its subsidiaries but the other large oil concerns or other proper firms to use our processes in the fields of oil, coal and tin hydrogenation. The management of the new company has been entrusted to Standard Oil.

"However, we reserved for us the right to use our new process in Germany alone and we made a special agreement in regard to the manufacture of gasoline by us for the German market. The conditions of this agreement protect our interests."

Digitized by Google

Bosch's statement makes it clear that it is the principal idea to meet the requirements of the German national defense by producing substitutes, even if more expensive than any available natural raw material: that could only be done if the owners of the natural products were driven from the German market or bribed by high prices not to undersell the substitutes. Bosch, an honest friend of peace, became, against his own wishes, the founder of the National Socialist trade policy.

He states clearly that he had no chance to develop the hydrogenation plants in the fight against the American petroleum firms selling natural oil, because of the impossibility of competing in price with the natural product. The high price was for Standard Oil an inducement, and for I. G. Farben, the condition of developing new processes in the oil field without which any idea of rearmament was necessarily hopeless.

All forms of international cartel agreements, no matter if offensive or defensive, deprived the German Government of its international influence, so even the international policy came in an increasing manner under the control of private groups cooperating with corresponding foreign groups. The list of the members of the committee sent by the Government to Russia contains representatives of cartels and monopolies, although that was the only governmental contribution at this time. Maybe the Russian Government preferred to negotiate with them because of the actual power conditions in Germany.

In 1932, the whole process had developed to the point that the German Government was driven out of the domestic, foreign, and social policy. The attempts of the Chancellors Bruening and Schleicher to restore the State failed. Their only serious attempt to a successful fight can be seen in an emergency decree of the Bruening government decreasing all cartelized and monopolized prices by 10 percent. The effect of the degree was frustrated by many policy devices of the "Pluralistic" powers. In the labor policy the labor unions followed just the same line: to oppose any governmental solution of the social situation and to extend their own powers to the greatest extent. The Berlin subway strike in 1932, was the answer to the attempt of the Government to adapt wages to the depression.

II. THE DEVELOPMENT UNDER HITLER

In 1932 the disintegration of the German state and society came to such a peak that practically any well-organized group of people, knowing the real stage of the disintegration and offering some integrating force, could take over Germany. The integrating force of a new flag, a new song, a new uniform, and a new promise cannot be overestimated, especially after years during which the attempt was made to overcome all difficulties by the application of rationality accompanied by inadequate action.[68]

It cannot be denied that the National Socialist critics of the situation before 1933 realized the dangerous "Pluralistic" development in Germany. They tried to meet the situation by the following means:

1. By unifying German economy and state through the exclusion of any person not in absolute accord with the party in power, from any place and any position in any enterprise, cartel, or other organization (Gleichschaltung).

2. By substituting groups organized as divisions of the "National Socialist Movement" and connected thereby with the Government in place of cartels or owners. These groups were supposed to establish market regulations in each of many industrial fields and to be connected with each other to secure uniform market regulation in all fields of Nazi economy.

3. By weakening the anonymous monopolistic corporations by the bestowal of numerous governmental favors on business enterprises acting under the personal liability of the owners.

4. By governmental supervision of all new investments this empowered the Government to prohibit new investments, to prohibit the establishment of new plants, and to act itself in a competitive capacity with any business firm at any time.

Whoever is interested in comparative law knows the danger of using conceptions of your own law or history in considering the law or history of another country.

[68] "The state is not an entity which issues certain statutes, diplomatic acts, judgments, or administrative decisions. Its real existence is in a process of continuous renovation and permanent resurrection. It is based on a plebescite which repeats itself every day" (Smend Verfassung und Verfassungsrecht Munchen, 1928, p. 18). This condition of the state is what is called integration.

Digitized by Google

Whoever says that in Germany the "state" controls everything should make clear that the German conception of "state" is not identical with the American conception of state. The German state is the most active expression of the National Socialist party,[69] taking control of society in each of its spheres and making subordinate to party anybody at any place in the German society. The process of "Gleichschaltung" did not make the corporations, enterprises, associations, or cartels subject to the "state" as a neutral institution serving the nation, but to the party dominating society and serving the aims of the movement. The process of the "Gleichschaltung" was successful in a very short time. After a few months the party could be sure that in any German corporation, big or small, either all the leading people believed in the "party," or that the "confidential advisers" inside of the board of directors could be trusted enough to control the entire life of these corporations for the "party."

The second means of the program to substitute cartels and owners by "Wirtschaftsgruppen" was much less successful. In some cases the "Wirtschaftsgruppen" took over the functions of the cartels and became the cartels themselves. In others the managers of the cartels became managers of the "Wirtschaftsgruppen." The only two "Wirtschaftsgruppen" to be considered as "corporations" in the conception of the corporate state, established by the "legislature" and the party are the "labor front"[70] and the "Reichsnaehrstand."[71] The "Reichsnaehrstand" is an organization including all persons or enterprises directly or indirectly engaged in the feeding of the nation. It is based on the Fuehrer principle, has public character, and exercises powers of market regulation to a very large extent.[72]

These groups are supposed to regulate their own policy within the scope of the National Socialist Party, but the party command goes so far that not much space remains for the free policy of the fuehrer of these groups. However, in all fields the situation developed quite differently from the idea the National Socialist Party had when it came to power.

It happened just as a noted economist said:

"Since the idea of the corporate state becomes now an actual policy, we have to expect that the economic groups interested in cartelization and monopolization will try to use the corporate idea for their own purposes and for their own private interests. The experience of the last decades has shown us that associations of entrepreneurs and other organizations of interested people become masters of the technique to use any kind of political ideology as soon as it becomes influential, in an efficient and impressive way. The observer of the development after the last war knows how the cartel government made their demands, sometimes under the slogan of labor or freedom of competition, sometimes under reliance of the idea of a planned economy, sometimes under the slogan of an economic democracy, sometimes under the slogan of freedom of coalition. Therefore, these cartels will have the idea to accomplish all under the slogan of the market regulation, what society refused them up to this date. The Deutsche Berwerkszeitung published an article called 'The Cartel Program of the Iron Industry in the Cooperative States." We can expect many new articles about cartels and cooperative states." * * * "If it should happen that the cartel managers should take over the market regulation and thereby get political regulation, no power in the world could avoid that their economic interests will be stronger than the political idea of the cooperative states and will falsify its institutions and destroy this state sooner or later."

Typical examples of market regulations by the "Wirtschaftsgruppen" can be found in leather, radios, and cigarettes. On November 28, 1936, the "Wirtschaftsgruppen" commerce and the "Wirtschaftsgruppen 6" of the German industry agreed on joint conditions of delivery and payment for the leather and shoe business. The performance of this agreement was entrusted to the Wirtschaftsgruppen leather industry, wholesale and retail trade. The field of the radio market regulation is discussed in other connections.

In the cigarette trade the producers are organized in a 100-percent cartel, although the wholesalers and retailers are not organized correspondingly.

Therefore the "Wirtschaftsgruppen" commerce interfered to build up joint conditions for the resale of cigarettes.[73]

A much more usual device is the appointment of cartel managers to positions of leadership in the "Wirtschaftsgruppen."[74]

In spite of all legislation favoring the dissolution of corporations and the transformation of corporations and partnerships[75] into smaller business units, the decrease in the number of independent corporations and business entities became more and more clear. German statistics indicate that monopolization in the hands of a relatively small number of enterprises is developing quite fast, very much against the program of the National Socialist party.

The power of the Government to regulate future investment proved to be less a weapon against the extension of monopoly powers than a powerful means to help the cartel organization against outsiders.

In any case, however, under the Hitler government the cartel organizations have been transformed entirely; the entire German economy was devoted to one single new aim—preparing for the rearmament program between March 5, 1933,[76] and March 16, 1936,[77] and completing the final rearmament between March 16, 1936, and September 1, 1938.[78] Without any consideration of the fact that Germany capacity was already enlarged, the war, and other pressures were expected to give priority to the largest capacity and expansion possible. The clearest expression of this policy was the "Vierjahrsplan."

As soon as the whole society is subordinated to one single economic aim and the people in power have sufficient means of persuasion and compulsion to utilize all available personal and material resources, the whole economy becomes a single weapon in the service of this one aim. This unity could be observed during the last war in Germany, and to a certain extent in this country; and it can clearly be seen at the present time in this country. Perhaps having one aim is the outstanding characteristics of totalitarianism.

After the disintegration period it was not difficult to bring the entire German personal and material power, including the cartels, within the orbit of this single aim.

Cartels which had monopolized production up to 1933 were now called upon to distribute the work necessary for national rearmament among the available plants. Cartels further had the task of inducing the various cartel members to enlarge their working facilities and to convert them into rearmament plants.

Cartels were no longer concerned with fixing prices because price regulation was now a governmental function. The Government now provided that prices could be changed only in accordance with governmental regulations.[79] The Government fixed prices by way of the "Reichsnaehrstand" or compulsory carterization, or by applying influence on already existing cartels. We will learn more about the development of the change in the significance of money in further discussions. The price cartels were now transformed into calculation cartels which published fixed schedules of cost calculations, to be respected by all the cartel members.[80]

Cartels previously interested in persuading outsiders to join do not worry any more about that—the Government forced the outsider by compulsory decree to help the cartels in the distribution of rearmament orders.[81]

Governmental power to establish compulsory cartels shifts the power inside of the cartels quite often. If the cartel members having great political influence

[73] "Wirtschaftsgruppen" were based on the Gesetz zur Vorbereitung des Organischen Aufbaus der Deutschen Wirtschaft of February 27, 1934, R. G. B. L. 1, p. —. It is interesting to note that in the very beginning of the National Socialist development an attempt was made to consider the acts of the Wirschaftsgruppen as acts of cartels legally fixing prices, etc. Philipp Kessler, the late fuehrer of the German economy, stated in a letter addressed to the Wirtschaftsgruppen, that they themselves were not entitled to fix prices or regulate markets (Frankfurter Zeitung, June 8, 1934). Kessler left and the Wirtschaftsgruppen became more and more identical with the cartels themselves.

[74] Even the cartel supervision was partly entrusted to the "Wirtschaftsgruppen" whose close connection with the cartels is described above. Erlass des Reichswirtschaftsministers of November 12, 1936.

[75] Gesetz Ueber die Umwandlung von Kapitalgesellschaften of 1934, R. G. B. L., 1934.

[76] The date of the election of the first National Socialist Parliament.

[77] The date of the enactment of the statute relating to obligatory service in the Army.

[78] The date of the ultimatum against Czechoslovakia.

[79] Ueber das Verbot von Preisstelgerungen of November 26, 1936.

[80] Interesting instances are the radio cartel of July 15, 1937, and the casting cartel. The scheme of these cartels is to give the firms some freedom of action in regard to the price but to make clear that the prices they ask are based on actual costs. The cost schedules serve as control guides.

[81] Gesetz Ueber die Errichtung von Zwangs Kartellen of July 15, 1933.

Digitized by Google

cannot accomplish their aim, they threaten with compulsory cartelization or with some other exercise of the power of the Government which can easily be granted by special legislation (for instance coal or potash legislation).[82]

The pre-war industry not directly connected with the armament program, but important in the subsequent development of the armament industry, such as the radio and automobile industries, the cartels were used as a means to enlarge consumption, and thereby production facilities or plants. Consumption was increased by a continuing standardization of products, such as the "peoples' radio sets" and the "peoples' cars." Cartels were used to compel skilled workers who preferred to do business as individual entrepreneurs to go back into plants as employees. The number of retailers in the radio industry admitted into the cartels decreased from 60,000 in 1933 to 32,000 in 1935; and even the number of wholesalers fell from 1,500 to 750.[83]

What was the effect of this new cartel policy on patents? Patents, insofar as the domestic market in Germany was concerned, lost a good deal of their significance and have been replaced in the main by profit devices. The patent owner belonging to a calculation cartel would have an advantage compared with the other members of the cartel. The existence of such a patent would endanger the existence of a calculation cartel.[84] Therefore the patent owner has to get such an unusually strong position inside the cartel that he is able to control cartel policy and to prevent complaints from the cartel members to the party and Government officials. The patent owner is very soon confronted with a demand to give a license to all other cartel members and to look for his advantage in the payment of license fees. Behind the demands of the cartel members the power of the Government exists to grant compulsory licenses without permitting any complaint in any court of the Patent Office.[85]

A patent is no longer the sole means of market regulation by license. When the Lieben patent expired, the Government considered the necessity for prohibiting the establishment of new plants for the manufacturing of radio sets and tubes.[86]

Thereafter, the Secretary of Commerce issued a decree establishing exactly the same situation that existed before the expiration of the patent. The licensing agreements made under the control of the Reich Chamber of Radio, a subdivision of the Reich Chamber of Culture, organized by the statute of September 22, 1933,[87] between the cartel of the producers and the cartel of the wholesalers and retailers, are described best by the decision of the cartel court of October 27, 1934, stating that these patent license agreements amount in themselves to a cartel arrangement. The Government, however, did not draw any conclusion adverse to this decision, even though the cartel court decided in a later case that, although these license agreements amount to a cartel, the refusal to give a license is not inconsistent with public policy. So it was more or less a logical step when the Government, exercising its power to prohibit new investment and new establishment of plants, prohibited by decree what had previously been prohibited by patents under which certain applications for licenses had been denied. The same was accomplished without the existence of any patent.

Patents protecting an invention not of immediate importance in the rearmament field were made useless by cartels. An interesting example is a resolution of the cartel of laundry owners. A circular decree[88] of the association of German laundries—a subdivision of an association of the German textile industry—on December 31, 1935, stated:

"The cartel committee resolved in accordance with Sec. 3 of the bylaws, with immediate effect, the following:

"1. All cartel members are prohibited from using any chemical process using cellulose derivatives for the purpose of starching any kind of laundry. All chemical processes known in Germany at the present time, with the exception of the usual starching process, are covered by this agreement.

---

[82] That may be the reason for the action of the Reich Secretary of Commerce requesting the establishment of a joint sales agency of all producers of brown coal in Middle Germany, while the producers for many years before had only a profit pool and did not, in the majority, seek more (Frankfurter Zeitung, December 16, 1937).

[83] Kartell Rundschau, 1939, vol. 36, p. 225.

[84] The only exception is the case in which all cartel members pay the same license fee, as in the radio cartel (Kartell Rundschau, 1937, p. 294).

[85] Sec. 15 of the Patentgesetz of May 5, 1936.

"2. Because of the extraordinary significance of all these chemical processes, the association of German laundry industry will try to make available to all members this technical progress in a certain form. The members are obliged to obey the orders of the association relating to any later introduction of chemical starching processes."

In this case the patent owner cannot use his patent, and no compulsory license can help him because nobody is asking for such a license. Cartels appear here as the adversary of patents, for the reason that they are made a part of the general system which has to accomplish only one aim—the rearmament. Patents which are not helpful in rearmament shall not be used until further notice of the government.

An opposite condition arises in all cartels active in the field of rearmament. The power of compulsory license is only a formal legal remedy. Of much greater importance is the influence exercised on the members of the board and the leading employees of a corporation, or even on the workers in the plants, by active members of the "party," of the labor front or of similar organizations, to make available all business and technical experience for the rearmament program. An enterprise refusing to cooperate in the accomplishing of a certain plan in the interests of rearmament by not giving a license to the other cartel members, or to other competitors, or to anyone else, cannot be imagined because of the tremendous pressure. Therefore, the fact that statistics do not report many cases of the granting of compulsory licenses does not mean anything about its real importance. The number of cases in which licenses are granted by pressure of the cartel management, or for management of the "Wirtschaftsgruppen," or of the labor front, is obviously very important.[89]

Shortly before the enactment of the new patent statute of 1936, on December 21, 1935, the Reichsgericht held that the creation or maintenance of a monopoly in any field of industry is a sufficient reason for the granting of a compulsory license. In this case the defendant held German Patent 378,330, granted on June 4, 1920, which covered an invention described as an invention "to examine perforated forms used for census purposes by a tool such as a bolt by which it can be seen if one of the perforations is out of place."

The petitioner alleged that he would be compelled to go out of business if he were not granted a compulsory license and, in that case, the defendant would control the entire market for such machines. The Reichsgericht found:

"The Patent Office was right in considering it a matter of public interest that competition between the parties would be impossible if a compulsory license was denied. It is obvious that a compulsory license cannot be granted for the sole reason that the patented invention could not be used without such license. An additional reason for its issuance is necessary. Such a reason may be that the patentee abused his patent monopoly, for instance, by refusing to grant a license and thereby doing harm to the public. But that is not the only point in issue. The public interest may be affected without any abuse of the patent monopoly power only because the existence of two different plants and enterprises is always to be considered as a public interest. In such cases the compulsory license cannot be denied even though no abuses exist."

It is noteworthy that in 1922 the Reichsgericht granted a compulsory license for no other reason than to provide work for unemployed workers. On January 24, 1934, the Reichsgericht repeated this decision and made it clear that this reason was a sufficient justification for compelling the granting of a license.

While we can realize the decreasing significance of the patents in the German domestic market, the situation was quite different with regard to foreign patents owned by German corporations or business organizations.

Subsidiaries and affiliates of the German corporations were also made to serve the one aim to which the entire German economy was devoted, the aim of preparing for rearmament up to 1936 and to rearmament itself after 1936.

---

[89] Between 1877 and 1933 petitions for compulsory license or revocations were filed against 1.5 percent of all existing patents. No official statistics have been published for the period after 1933 which distinguishes petitions for compulsory license from petitions for revocation of patents, but all publications indicate that the number of compulsory licenses is increasing. Compulsory licenses which are now granted by the government were granted under the conditions before the statute of 1936 for the following reasons: (*a*) Improvement of security of production (Reichsgericht January 3, 1927) and security of communication (RG February 14, 1934); (*b*) improvement of health (RG November 30, 1929); (*c*) cheaper production of merchandise necessary for the public (RG November 26, 1930); (*d*) better supply of the domestic market (RG May 27, 1918); (*e*) avoidance of unemployment (RG January 24, 1934); (*f*) increase of export (RG December 21, 1935).

The number of instances is too great to give any complete description in this connection. However, it may be helpful to give one instance.

Schering-Kahlbaum A. G. Berlin.—This German enterprise developed from a pharmacy, the "Green Pharmacy" in Berlin. In 1864 it was transformed into an industrial enterprise under the name "E. Schering." It became a corporation in 1871.

The principal products manufactured by Schering are synthetic camphor (included in the production program in 1902), photographic papers (included in the production program in 1904), and pharmaceutical specialties.[90]

Even before the first World War, the German Schering concern had acquired foreign subsidiaries and foreign plants.[91] After the war Schering acquired coal mines, enlarged its production program, developed its business in photographic articles considerably, and merged with C. A. F. Kahlbaum Chemische Fabrik G. m. b. H., Berlin, in 1927, under the name of "Schering-Kahlbaum, A. G."

The reconstruction of Schering's foreign business after the war was especially essential for Schering, because more than 50 percent of Schering's products had been sold in foreign countries. Furthermore, interests in the British Foreign Chemical Producers, Ltd., in London, and in the Lepel Ignition Corporation of New York were acquired. The annual report of 1930 mentioned as principal markets South America, Italy, and Spain. In all these markets the United States appeared to be the strongest competitor.[92]

The following figures give some indication of the scope of the business. The working capital of Schering was:

	RM.
In 1913	60, 465, 954
In 1929	70, 971, 090
In 1939 more than	102, 000, 000

The export of chemical products amounted to 60 percent of the entire business in 1938. In 1938 the export was even greater than in 1929, despite the depression. The pharmaceutical specialties constitute an ever increasing part of the entire export. We read in the annual report of 1938:

"Relating to the future development of the pharmaceutical business, the fact of the export is decisive. The development of the export to oversea countries may be quite different from the development of the export to neutral Europe. It may be an open question whether the former stability of the domestic market will be affected by the additional war demand, because the preparations use less pharmaceutical mass products than specialties. These specialties are often necessary for life and their sales price is very high compared with the price of the raw material."

The United States subsidiary was established in 1930 (Schering Corporation), which acted in the beginning merely as an importer of pharmaceutical products. In 1934 Schering Corporation of New York acquired part of its present plant in Bloomfield, N. J., and began to engage in the manufacture of pharmaceutical hormones. In 1936 Schering, Inc., New York, transferred its assets to Schering, Inc., New Jersey, and the personnel located in New York moved over to Bloomfield, N. J. Similar subsidiaries existed in all parts of the British Empire.

Schering controlled a huge number of patents in the field of certain pharmaceuticals (hormones, camphor, borax, etc.). Licenses under these patents were granted to subsidiaries all over the world.

The organization of subsidiaries did not prove to give sufficient control; therefore, Schering, A. G., entered cartel agreements with German, Swiss, and Dutch companies, pooling all the patents in this field, exchanging information, and drafting patent applications in accordance with such agreements. Each of the partners to such agreement, no matter if Swiss, Dutch, or German, established a

[90] The annual report of 1939 goes so far as to mention the pharmaceutical specialities as one of the most important articles of the Schering concern.

[91] The first subsidiary was established in Russia in 1905, but was seized by the Russian Government in 1914. All over the world subsidiaries have been established (Shanghai, 1922; London, Madrid, Milan in 1925; Buenos Aires and Rio de Janeiro in 1926; Lisbon in 1927; Montreal, Calcutta, and Mexico in 1928; New York and Havana in 1929; and Santiago in 1930).

[92] Forty-nine patents and 34 trade-marks were seized in the United States. It may be noted that the company complained much more about the loss of trade-marks than about the loss of patents: "The trade-marks are lacking, particularly in the United States where we have to start as a new business. Our old trade-marks are in the hands of another enterprise today and is doing a good business. The introduction of new trade-marks is a very expensive matter."

Digitized by Google

subsidiary in this country, which followed, with or without special contractual agreement, the instructions of the parent corporation, which in turn came more and more under the command of Schering-Kahlbaum, A. G., Berlin. Before the outbreak of the present war Schering tried to accomplish what I. G. Farben had accomplished a long time before: to interpose between themselves and their foreign subsidiaries, a Swedish or Swiss corporation, a transaction which did not change the real factor of control and which made detection more difficult.

The National Socialist government used three devices to accomplish their result: (1) The so-called currency control; (2) the control of the personnel of the foreign films by party organization; (3) the influencing of foreign competitors to omit actions important to the national defense of their own country.

The world had experienced anti-inflationary legislation in many countries, particularly in Germany in the years after 1918. Therefore, the world did not realize that currency legislation might have other ends entirely. So it was possible to build up a situation whose significance cannot be overestimated: property belonging to the residents of one state and situated in another state, with control exercised by the residents of the first state even though the property was formally held by a trustee or foreign corporation within the state of the property's location as a special function in connection with foreign trade. The imports of a country can be paid for only through two means:

Either by the export of goods (gold is only one special kind of such goods) or by income from property, especially business interests, of residents of the importing state situated in the exporting state. In a self-regulating, capitalistic economy this function of foreign-owned property is one of the factors that determine the balance of trade. If the amount of income from foreign in the exporting state owned by residents of the importing state is exactly equal to the value of the imports, there is no balance of trade and no need for foreign currency. Without the income from the property in the exporting state the importing state would have an unfavorable balance of trade and the need for foreign currency would be great. In an economy which is planned and regulated by the government, the government will interfere with private property situated abroad to such an extent that it will finally use such property, or the proceeds of such property, to pay for such imports as the government deems essential. In such case the value of the controlled imports will be made to coincide exactly with the value of the income from the foreign property.

The system first mentioned prevails in the United States, and the second has been developed in Germany since 1931. In commenting on an official speech made by Pietzsch, president of the Reich Economic Council, the leading German magazine in the field of currency law,[93] made the following statement:

"Two camps are now established; the one under leadership of the United States; the other under the leadership of Germany. In the United States the traditional principles of economic liberalism are in the forefront—at least theoretically—holding that the world is one unique large market in which each people shall offer what it is able to produce cheaper than others. This system is conditioned by a free and unlimited system of payments. In the German group a number of national economies tries to draw the consequences from bad experiences of the past and establish something new * * *"

The devotion of all German property situated abroad, and the subordination of all rights in such property, to the interests of the Reich, developed in three steps which are disclosed by the several phases of the German currency legislation discussed below:

(1) In 1931 Germany enacted statutes and decrees for the purpose of controlling all transactions which might tend to endanger the already weakened monetary situation of the Reich. The report of the committee of the League of Nations, made in 1934, "to arrange for an inquiry concerning the causes, scope, methods, and results of compensation and clearing agreements," stated:

"Exchange control is only one form of defense against the effects of the general depression on countries whose economic and financial structure was especially vulnerable."

In order to avoid any further danger to the monetary situation in Germany, the statutes and decrees of 1931 restricted the right of a German owner of American property to dispose of such property without governmental approval. Since the laws gave the German Government the positive power to direct the manner of the disposition of such property, the laws were limited to measures necessary for the protection of the monetary situation.

[93] Devisenarchiv, IV, p. 906, August 1, 1939.

Digitized by Google

(2) On September 24, 1934, Germany announced the "new plan," the basic principle of which was enunciated by Dr. Schacht in a speech on March 4, 1935,[94] in these words:

"Do not purchase more than our country can pay for and purchase first what the country really needs."

The private entrepreneur retained the initiative in the matter of purchases; though application had to be made to the government for approval, and the government had the right to determine what was really "necessary" for the country. In commenting on this new plan, Wagemann, president of the Institute of Business Cycle Research[95] stated:

"The principle of free import, which was restricted only by the general currency and duty regulations was substituted by a general control over all imports, the aim of which control was to select imported goods according to the available foreign exchange and the needs of domestic production."

It thus became clear that the ends for which private property owned by Germans, and situated e. g. in the United States, would be used by the German Government, were quite different from those ends for which the property had been used in the first phase of the German currency regulation. In the second phase of this regulation, the assignment of private property could be demanded by the German Government for the payment of debts, contracted by private entrepreneurs engaged in foreign trade with the approval of the German Government, and for other monetary purposes.

(3) The third step was taken in 1937 in connection with the so-called Four Year Plan (Vierjahresplan), and gave the German Government the power to determine what could be purchased abroad, even in cases where the formal contract was between "private" parties. The Nazi regime could dictate to a subsidiary or citizen abroad what foreign property should be purchased. The whole German economy then became dedicated and devoted to one political aim—total rearmament.

Thus the currency administration finally evolved from a measure to protect the German currency from the menace of depreciation to an important means of controlling the entire German economy. And this situation has not been changed by the war.[96] The currency legislation is now used by the German Government as a means to control all "private" commercial activities abroad, and it denies governmental protection to private interests engaged in such activities unless its consent to undertake particular transactions has been secured.

In other words:

"The totalitarian state governs the economy with strong hands; it determines what economic relations towards foreign countries are desirable."[97]

The technique by which private property was placed under the absolute control of the German Government was developed in 1931, and no basic change in law was necessary to accomplish the ends to which the currency restrictions laws were later devoted. This technique is relatively simple. Every foreign security, claim, patent, license, etc., must be registered with, and offered to, the Reichsbank. The Reichsbank can then appropriate it whenever it deems it desirable to do so. No disposition of foreign property owned by a German resident is allowed without permission from the Reichsbank. If such permission is given, the proceeds must be delivered to the Reichsbank or to an authorized agent.

The statutes and decrees relating to the foreign currency are to be interpreted in connection with numerous circular decrees of the central agency for the management of foreign exchange. These circular decrees show that it is the policy of the German Government that no property situated abroad belonging to residents of Germany can be used for purposes not in line with the policies of the Government, and all such property, as soon as usable for foreign exchange, must be used in compliance with such policies.

The question is thus presented as to whether or not German "private property" can be recognized as "private property" in the conception of Anglo-American law, or any other law applying the liberal conception of property. The "private" owners of such property cannot dispose of it definitely or for a limited time by pledge, loan, license, etc. He must offer his "property" to the Reichsbank; which may accept this offer at any time, and take the property for con-

sideration of 2/15 Reichsmarks on the dollar; which is a purely artificial rate, fixed arbitrarily by the German Government, greatly overvaluing the mark, and undervaluating the property.

In Germany the so-called "legal" title remains in the private owner, but his right of disposition is restricted, and the Reichsbank has the positive right to take it in consideration for a purely artificial value. It is thus clear that the distinction between the Russian case and the German case is merely a formal one; for the rights of "private" property have been subordinated in Germany to the policies of the Reich to practically the same extent as the rights of private property of residents of Russia was subordinated to the policies of the Soviet Government.

It might be argued that the German "owner" receives compensation in a situation where the Reichsbank accepts the offer, just as it is argued in the United States that no cloud is cast on the title of a property owner by the fact that at some time he may be deprived of his legal title by an expropriation for public use; in which case he must receive just compensation.

The most obvious distinction between the German and Anglo-American conception of property right is that under the liberal conception the proceeds of a compulsory sale can be used to acquire similar property, such as a piece of land next to the expropriated land, and which land can be used for exactly the same purposes. The German resident, however, who owns foreign property, does not get compensation which equals his previous "property right." His "compensation" is based upon an arbitrary and artificial value. It is true that he had a "property right" which had a "value" in all countries, including Germany. But after German expropriation of the property, he receives compensation which for all practical purposes, represents a value only in Germany and no value in any other country. He must put his property at the disposition of the German Government. Therefore, the position of an American property owner, who may be compelled to surrender his property for a just consideration, and a German "owner" of foreign property, are not comparable.

The second distinction makes it absolutely clear that the two situations cannot be compared, and that the legal status of the German "owner" of foreign property and an American property owner are absolutely different. The American property owner can dispose of his property in any way he may choose. He may rent or sell it and use the proceeds as he may see fit. It is true that under rare circumstances the State may take his property for just compensation, but that possibility casts no cloud on his title, nor does it restrict the way in which his property may be used. The German owner of foreign property, however, cannot dispose of it unless the German Government gives its consent, and he may be compelled to dispose of it by order and for the benefit of the German Government. The end of his "property right" is a sale for the highest price he can get, the money from which must be paid to the German Government. It is clear, therefore, that the German "owner" of foreign property is not an "owner" of anything in the legal conception of that word because he cannot dispose of his property, and can only exchange it for a consideration which he does not get, but which is paid to the German Government who gives in exchange a grossly insufficient value.

"Property right" is difficult to define, but it may be said that in the Anglo-American conception a person has no property right if he cannot dispose of it as he likes; or if he may be compelled to dispose of it against his desires for an inadequate consideration; or if the consideration received for the voluntary disposition of his property does not actually belong to him. This is the situation of the German "owner" of foreign property.

It is extremely difficult to use judicial concepts of one legal system in the understanding of a factual situation in another. However, the attempt must be made so that a sound international picture can be portrayed and so that foreign relations of this country may be worked out within constitutional limitations. The German "owner" of foreign property, as discussed above, has no "property right" under the conception of American law. He has only a special right to keep assets in his name until he is ordered to give it up. It may be said that he is in no way better off than if he had only a mortgage on a property of somebody else. The mark value in Germany is his real and final right, but even that value is determined on an artificial and arbitrary basis; and all tests of a true property right, in the Anglo-American legal conception, are lacking.

In the conception of the new German terminology the "owner" (who may be called the overlord, if the use of feudal conception helps in the understanding of this new order) is the "Volksgemeinschaft," which may be loosely translated

Digitized by Google

as "the whole German people," and whose agency is the German Government. It is the actual "owner" of all property situated abroad in the name of German residents. Such property is not "private" but "public," since all rights of ownership may be exercised by the German Government, and the private nominal "owner" must dispose of such property as he is directed, and, in case of such disposition he will "receive" compensation which in turn he must dispose of as the German Government directs.

It is clear from the foregoing, that the effect of the German currency legislation is to enlarge the sphere of its influence, and to give as much property as possible the character of German "public" property. An effective means to accomplish this is the legal definition of the term "residence" adopted in Germany, under which all persons, over whom even an indirect influence is exerted, are declared to be residents of Germany to the extent that it is in the interests of the German Government for them to be residents.

In the circular decree issued by the chief of the German Agency for Currency Administration of October 22, 1936,[98] it is provided:

"Branches of domestic corporations in foreign countries and legally dependent foreign plants of a resident of Germany, if the place of their management is in Germany [are deemed resident in Germany].

"The same rule must be applied to legally *independent* partnerships and corporations whose seat is abroad, provided its management is in Germany.

"In regard to the determination of where the place of management of partnerships and corporations is, the place where the actual decisions relating to the management of foreign corporations are made shall be decisive.

"These principles which are in agreement with the tax law are to be applied without any limitation only to corporations dealing with the administration of property (including the corporations dealing with the administration of patents and other rights of authorship), no matter what their legal form may be (family endowments, associations, combinations similar to the German association with limited liability) * * *.

"However I wish to assume a foreign place of management in the case of production or sales organizations wherever the foreign management is decisively influenced from Germany * * *. If this treatment, favorable to the interests of the participants and the freedom of handling business arising out of this treatment, should lead to abuses, I reserve the right * * * to include also production and sales organization." [Italics supplied.]

This decree declares American corporations, domiciled in the United States, "residents of Germany" and makes their property thereby "public property" of Germany, if they are under the "decisive influence" of German residents, and if they deal with the administration of property including patents. The difference in the treatment of corporations dealing with the administration of property, and the "Erwerbsgesellschaft" (active commercial enterprise) is explained by the fact that it is to the interest of the German Government to allow active commercial enterprises to operate so that profits can be made; which profits must be transferred to the Reichsbank to the extent that they come into the hands of German residents.

Corporations dealing with the administration of property situated abroad are liable to the same extent as any other "resident" of Germany. If they use this property otherwise than permitted by German law, they will be treated as though such property had been the subject of an illegal conversion. The execution of the decree issued in such circumstances is assured by the provisions of the foreign currency statute which provided that every "resident of Germany who dominates the corporation is * * * also liable."

Since 1936, when the circular decree under discussion was issued, the practice developed in Germany has tended to abolish the distinction between corporations dealing with the administration of property and "Erwerbsgesellschaften." At the present time every single act of an "Erwerbsgesellschaft," which has to do with the administration of property, places such property in the power and under the control of the German Government. If an "Erwerbsgesellschaft" desires to make a "new investment," it must take the amount of money or other property out of its working capital, and such transactions are treated as an administration of property under the currency decrees. The consequence of this is that such property actually loses its character as private property and becomes "public" property.

[98] No. 152/36, D. St.

Digitized by Google

The decrees do not contain a final definition of what a "new investment" is. Senate Court President Dr. Dreist,[99] who suggests that the German practice be interpreted as much in favor of the interest of the domestic dominating corporation as possible, used as a test the determination as to whether an investment is made to increase the capacity of the corporation organized abroad, or only to keep it in the same position as it was at the time of the enactment of the currency law. All assets of such corporations not invested in permanent investments before the decree, and which are not needed for maintaining the position of the enterprise, must be offered to the Reichsbank; and the currency administration is the sole authority to determine what is needed to "maintain the position of the enterprise."

A certain difference between the two forms of corporations is that a corporation dealing with the administration of foreign property is primarily liable under the German law; while in the case of the Erwerbsgesellschaft, the German resident dominating the foreign corporation is liable. He must offer the property of the corporation to the Reichsbank; even though such property is situated abroad, and he must devise the means to satisfy the commands of the German authorities, and he must use his influence so that he can offer everything to the Reichsbank which is not a part of the work of the Erwerbsgesellschaft. Dreist frankly admits that if the offer had to be made directly by the foreign Erwerbsgesellschaft the fact that such foreign corporations are really "German corporations" could not be kept secret.[1]

The fact that all reserves and all property to be used for new investments must be offered to the Reichsbank, puts the entire corporation under the effective control and supervision of the German Government, because it may inspect all books, documents, and reports concerning all transactions to determine whether the corporation really restricted itself to activities recognized to be in the German interest.

In the same sense in which the property of residents of Germany situated abroad may be called "public property" of Germany, the types of corporations through the medium of which the German Government owns and uses property, in its sole interest as instrumentalities of the German Reich, are also "property" of the German Government. Under the present German practice, corporations doing business under foreign charters are controlled and exploited for the purposes of the German Government, if the persons who have any kind of controlling interest in those corporations are residents of Germany. The result of this is that the German Government actually exercises control over all American corporations a majority of whose stock is owned or controlled by residents of Germany. A realistic approach must be made to this situation, and it is obvious that these corporations cannot be treated in the same manner as ordinary commercial corporations. Otherwise the United States will be permitting the legal device of a private corporation to be used for the uncontrolled and unrestricted activity of a hostile foreign government.

The new German theories are absolutely logical in their treatment of "private property" situated in Germany and belonging to residents of foreign countries, or branches of foreign enterprises in Germany, or corporations organized under the German law and domiciled in Germany, but controlled by foreign interests.

Under the new German legal theories no distinction is made between public and private property situated in Germany belonging to owners residing abroad, except in the enforcement of civil suits. The German currency legislation is in fact not only a law establishing the management of property situated abroad and owned by residents of Germany, but is at the same time a law regulating the use of property in Germany owned by residents of other countries. None of such property can be taken out of Germany. All of such property has to be paid into special accounts as soon as it is reduced to money or credits; these can be used only within Germany, and only with the special approval of the German authorities. These special accounts are what are known as "blocked marks." Licenses to use these accounts for purely domestic purposes are now being granted to a less and less extent; this has resulted in a fall in the value of these accounts in other countries to about 10 percent, and these accounts cannot be used to pay for goods exported from Germany. The manner in which goods exported from Germany are paid for will be commented on below.

---

The new German legal theories are not particularly concerned with corporations organized and domiciled in Germany, but under control of foreigners, because these corporations are subject to the German restrictions anyhow. Such corporations are not regarded as foreigners, because under the general rules, corporations cannot send anything abroad, and no payment, even inside Germany, can be made out of profits or otherwise to the foreign shareholders, partners, etc., without approval. The result is that the actual control and supervision of such corporations by the Government is extremely effective.

In spite of such control, it was believed possible that an enterprise, influenced by foreign interests, might take steps which would be harmful to the German currency, and therefore to the German general economic interests.[2] To avoid this the requirement of a permission to transfer interests in corporations was adopted by the German Government as a weapon against the development of foreign influence in German corporations.[3]

The principle of German law that a foreign branch or plant of a German enterprise, which is under a management residing in Germany, is a resident of Germany,[4] and that a plant or a branch of a foreign concern in Germany is also a resident of Germany is surprisingly illogical; but it cannot be assumed that the treatment of a German branch of an American corporation, or other enterprise, as a resident of Germany is a mere technical surveillance. The following decision of the Reich Economic Court (Reichswirtschaftsgoricht) of March 23, 1939,[5] shows how the rule works in practical application. The case was as follows: In a merely technical accounting between the branch in Germany and the foreign principal headquarters of the enterprise, the price for 10 tons of aluminum was assumed to be 65 marks, although "the price adjusted to the interest of the enterprise and the national economy would have been 95 marks." Actually the branch had charged the lower price because the corporation, in order to avoid excessive taxation, did not wish to have profits in Germany. It would have been reasonable if the German tax authorities had used the higher price as a basis for the computation of the profit on the transaction for tax purposes, but the manager of the branch was punished for a disposition of a claim against a foreigner payable in marks, prohibited by section 11, paragraph 2, of the 1935 foreign exchange statute. The court said:

"The basic idea of Section 11, paragraph 2, *is to prevent values corresponding to foreign currency from being transferred to a foreigner* * * *. It makes no difference whether the disposition is to be seen in an agreement to sell goods for a consideration of 90 Marks and later to discharge the debtor as to 25 Marks or to sell the same goods at the outset for 65 Marks in spite of higher price justified by economic reasons." [Emphasis supplied.]

The result of this decision was that the German branch was compelled to offer to the Reichsbank the countervalue of the "just" consideration for the goods, and it illustrates how every transaction between an American corporation and its German branch is subjected to the approval of the German Government. Thus, for all practical purposes, the German branch of an American corporation is treated as a German corporation, but—as was shown above—an independent American corporation, in which German interests are involved, is also treated as a German corporation.

It is argued in Germany that if the German Government should accept the distinction between public and private activities in the field of international practice which is accepted by all "liberal" countries, it would be harmful to German interests, because, for example, Germans are not protected in the United States against private boycott propaganda, while Americans in Germany are so protected. However, in practice, Germany derives a tremendous benefit from the clash between the two schools of international practices. Boycott of the goods of any country can be accomplished in Germany by means of currency control without the slightest publicity, but at the same time the device of "private" property, and its constitutional protection in the United States and other liberal countries, is used to accomplish political aims of the German Government in such countries. At the same time "private" property in Germany belonging to residents of the United States, is brought under German governmental control under the outspoken theory that the protection of the German currency requires this, and under the assumption that Germany regards all the property of foreign-

Digitized by Google

ers as belonging to the economy of their respective countries of which disposition is theoretically possible only in accordance with an international government. Thus, the situation is this: That what a resident of Germany owns in the United States is controlled by the German Government, and can be used by it to any extent it may choose, but what a resident of the United States owns in Germany is also under control by the German Government.

Further illustrations of this unequal situation are suggested by the following: One who has secured a valid judgment in a German court against a resident of the United States may enforce his judgment in the United States, and, after execution, may take the proceeds out of the United States. One who secures a valid judgment in an American court against a resident of Germany, may, under limited circumstances, receive permission from a German court to enforce his judgment there, but if he is successful, he cannot take the proceeds of the judgment from Germany, nor may he use the proceeds in Germany as he pleases.

Theoretically, the American owner of a German patent has the same rights as the German owner of an American patent. Actually, disposition of the German-owned American patent lies with the German Government. Because no assignment of the right located in Germany is recognized in Germany unless approved by the currency authorities, the American owner of a German patent can sell or license his patent only after obtaining permission from the German currency authorities. And such permission is only granted if it is considered to be of advantage to the German Reich.

The most commonly discussed instance of inequality is the situation resulting from the distribution of inheritances. A German resident who becomes a distributee of an American estate gets everything, and can take his inheritance out of the United States, but he must use it as directed by the German Government. The American resident who is a distributee of a German estate cannot take his inheritance out of Germany, and for all practical purposes, gets nothing.

This discussion should make very clear to what extent property of citizens of the United States held in Germany is made to work for the Axis interests. Numerous instances may be shown: The largest German tank plants—Ford, Cologne, and Opel (General Motors); a large part of the German radio industry, C. Lorenz, Schaub, Mix & Genest, etc., are controlled by I. T. & T.; the business machines industry (Elliott-Fisher Maschinen Gesellschaft Berlin, Optima Machine Fabrik A. G., and Deutsche Hollerith Maschinen G. m. b. H. Berlin, controlled by Hollerith; the lock and key industry (Yale) in control of the largest European plant; important food interests (Corn Products); petroleum industry (Standard Oil of New Jersey, Atlantic Refining Co., Pure Oil Co. of Ohio, Sinclair Refining Co.).

All these corporations subject to the German currency legislation could not send one penny out of Germany to their parent corporations in the United States. They were in a pinch. On the one side they were threatened with losing their money in Germany through the increasing danger of a German inflation. On the other side they were prevented from investing any money in American currency. This was exactly what the German Government wanted; it made those firms pliable to its demands. They were encouraged to invest in enlargements of the plants, installation of new rearmament equipment, or in the building of tankers or similar ships which are now parts of the German Navy. Some cases are known in which such investment was only permitted by the German Government under the condition that at least 10 percent of the costs and expenses of the building or establishment were paid for in dollars. Thereby the German Government would not only get the installation of new plants and rearmament equipment but also foreign currency. The patents of all these firms in Germany became subject to all such interferences of the Government and the cartel system and all the other handicaps described above, while, as already mentioned, the patents of German firms abroad became of additional significance, at least from the point of view of the German Government.

All personnel of these firms in Germany became subject to the regulations of the National Socialist Party and the National Socialist labor front, but also the personnel of German subsidiaries and affiliates in foreign countries also became subject to the same regulations and instructions of the party and labor front. The certificate of membership in the labor front was no less a condition for getting a job in a subsidiary or affiliate of a German firm in South America or in this country than it was over there. This personnel, acting under such instructions, could not only observe efficiently the technical work done in such firms or in affiliates of such firms, but they could also report to

Digitized by Google

the authorities to what extent the currency regulations imposed upon the subsidiary or affiliate were fulfilled by such firms. What constituted a permanent threat to the parent corporations in Germany, the patent applications and the patents themselves, thereby obviously became subject to a permanent supervision by the labor front and party.

Foreign subsidiaries and affiliates as weapons for the preparation of rearmament and for rearmament itself had also the important task of making available sufficient foreign currency and to form a permanent tie between the Government and foreign industries.

A great deal of the success of Dr. Schacht in managing to get ample supplies of raw materials, in spite of the lack of gold and in spite of insufficient exports, may be attributed to the fact that all affiliations, licenses, and subsidiary relationships were used to make available the money for the necessary payments. That means that, for instance, a subsidiary such as American Bosch, had to pay royalties on patent licenses and dividends from funds in American banks. No disposition of this money was possible without the approval of the Nazi currency authorities, and these affiliated firms were often advised by the German Government to make loans or to pay license fees for a number of years in advance.

In regard to the technical development much looks today to Americans as a conspiracy in restraint of trade what was only the result of a condition in which one well-organized industry and its country with an absolute clear and determined policy and aim met an industry and a country without such definite and determined aim working in accordance with the principles of liberal economy. Since 1933 the German cartels and monopoly concerns knew very well what their job in the scope of the National Socialist program was. They knew that every research laboratory has to work to find substitutes for raw materials in which Germany is not self-sufficient. They just continued the work where it was left in 1918. The National Socialist Party invented the slogan of self-sufficiency as the ideal of its economy, therewith masking to the outside world its real aims.

The well-organized research directed toward one single aim—the preparation for rearmament—necessarily led to a large number of new processes in the entire field of substitutes and increased exploitation of available material, especially insofar as tin, rubber, zinc, oils, and fats were concerned. Compared with the natural raw materials, these products were inferior. Therefore, the owners of the raw materials in the United States and the British Empire and the American and English owners of such materials situated in the Netherlands Indies and China were not interested in these experiences; even if in spite of the provisions of the currency legislation the German firms offered experiences and information to the British and American firms in pursuance of existing exchange agreements.

Another point has to be made in this connection. The National Socialist Party always understood very well how to use the misunderstood aims of certain groups and to abuse those groups for their own purposes. American business was not immune. The German cartel partner or raw material owner or firm connected with raw material owners did not object against very high prices for their raw materials. We learn in connection with the gasoline case that Dr. Bosch made the open and clear statement that I. G. Farben could only be successful in the field of raw oil production by price agreements with its American partner in pursuance to which the price of natural oil on the German market was so high that artificial German products could compete. The same observation can be made in other fields. In spite of the tremendous rearmament the increase of the import of tin and tin ore was relatively small. The obvious reason was the successful treatment of tin by the German industry, thus saving material. In regard to zinc, Germany established a 50,000-ton electrolytical plant in Magdeburg, which increased the supply of zinc considerably. The writers of International Control in Non-Ferrous Metals[6] misunderstood the significance of this development so much that they wrote the following (p. 722):

"It is increasingly difficult to make satisfactory adjustments in Europe, where the opening of the Magdeburg refinery disturbed the balance between German, Polish, and Belgian industries."

Here we see the basic difference between the standpoints of the two worlds relating to new inventions: The liberal world thinking in terms of "balance," the totalitarian world thinking in terms of preparation for the destruction of balance. The German industry substituted more and more light metals for copper and used

[6] Published by William Yandell Elliott, etc., the Macmillan Co., 1937, vol. 9.

Digitized by Google

extremely expensive methods to obtain copper out of the poor German mines. Of the entire need of 250,000 tons of copper, 30,000 tons came from the German mines in 1938. The price of copper was so high that it was good business for Germany to use even the most expensive processes to make substitutes for copper. Nickel gave way to chrome alloy and chrome ore.

Patent exchange and exchange of information may sometimes be effective in the national interest if the countries to which both partners belong are following basically the same policy. As soon, however, as one of these countries follows a different course of economic policy, the exchange becomes ineffective and only useful in the interest of the country which uses everything for one and the same aim—the aim of rearmament, for which practically any kind of invention can be used more or less efficiently, while the other countries have no use for invention confined to the aims Germany has pursued.

Thereby the situation developed that the German industrialists could use all American experiences for their purpose while the Americans were just not interested in the experiences and patents in the field of rearmament, or of substituting something for the raw materials which America has or controls.

The devastating effect of patent exchange agreement develops in serious political times. If patent exchange agreements do not only exist between a German firm and an American firm, but if relating to the same patents exchange agreements exist between the German firm and Latin-American firms, export from the United States to Latin America becomes impossible while relations under the patent rights exist in South America. A similar situation arises if the German firm does not exchange its patents with a Latin-American firm but keeps these patents itself, in its own name, since in this case the German firm can prevent import to the United States. This patent situation makes it clear that a mere interruption of the agreements between Germany and South America or a mere seizure of the patents in the United States does not reestablish the American right to export to Latin America. International agreements with countries of the Western Hemisphere are necessary in this respect, to accomplish this aim.

Out of the discussions about the development of the German cartel and patent law we learn the following:

1. Cartels may be very efficient political weapons in connection with high tariffs or with patents or with subsidiary corporations.

2. Cartels and owners if at the same time strong and not under efficient governmental control, are dangerous infringements on the rights of a government in the domestic and international field.

3. Patents are used as a basis for cartel organizations in several ways—

First. Patents can be assigned or licensed to subsidiaries in each country, preventing any export by these firms and establishing permanent control over such firms.

Second. Patents taken out by foreign firms only for the purpose of prohibiting the work of American firms in certain fields.

Third. Patents can be exchanged with affiliated firms with the effect that the party obtaining the patent is excluded from any other country but its own.

Fourth. A system can be worked out in pursuance of which all licenses of the patents of an American firm are granted to firms situated in certain countries, while the German partner licenses other firms in other countries, thereby accomplishing an absolute distribution of markets.

Fifth. A patent on one article can be used to control other articles in the international market, as for instance, in radio development.

Sixth. The patent and cartel device can be used as a dangerous political weapon by any aggressive country. That has been done in connection with currency legislation providing for licensing of patents and exchange of information.

Seventh. Patents during time of war have been used to prohibit the export of important articles to countries in which the United States takes very strong political interest.

Eighth. Patents and cartels have been used to increase prices and to thereby make possible the production of substitutes and the increased exploitation of domestic goods.

Ninth. Germany used the patent and cartel device very efficiently in the preparation and waging of the present war.

The conclusions relating to the present bill are so obvious that any further discussion seems to be unnecessary.

EXHIBIT No. 133

ACETIC ACID AND OTHER ACETYLENE PRODUCTS

Statement by Irving Lipkowitz

INTRODUCTION

It is customarily claimed that when foreign corporations patent their processes in this country they bring to this country the benefits of foreign inventions and discoveries. Self-labeled international corporations contend that their patent pools with foreign interests bring into the United States valuable processes which would otherwise be unavailable here. Conceivably, if all foreign patentors and the members of these world-wide patent pools operate in accord with the motivating spirit behind our patent laws, to promote the advance of the industrial arts, those benefits would accrue. The practical question is whether we actually benefit, not whether we theoretically could do so. The need for maximum output under the war-production program makes it especially urgent that we determine whether foreign influence over United States patents has hindered our essential industries.

In connection with any analysis of actual case histories involving foreign patentors, it is important to note that the existence of antitrust laws in this country force foreign corporations and world cartels to rely very heavily on technically legal patent arrangements in their efforts to eliminate competition within their industries. Consequently, as will be shown later in detail, United States patents issued to cartel-minded corporations, such as I. G. Farbenindustrie of Germany, have been used with disconcerting frequency to improve their own international position by so manipulating them that production in this country was hampered rather than stimulated.

This analysis is limited to the activities of I. G. Farbenindustrie in a single branch of the chemical industry, acetylene and its derivative products, particularly acetic acid. Primary attention is given to the operations of an international patent pool which was operated here by I. G. Farben and Standard Oil of New Jersey.

ACETIC ACID—ITS IMPORTANCE AND DEVELOPMENT

Acetic acid is one of the most important heavy chemicals used by industry. Last year the United States consumed 293,000,000 pounds of it. The largest single outlet is in the manufacture of cellulose acetate, which required 140,000,000 pounds of acid in 1941. Cellulose acetate is the raw material used in manufacturing rayon, safety photographic film, and an important type of plastics. The second largest field of consumption is solvents, which are used in making paints, lacquers, and varnishes. These two broad categories account for over three-fourths of this Nation's consumption of acetic acid. Other important uses of this chemical are in the manufacture of pharmaceuticals, particularly salicylic acid, which is aspirin, and salvarsan. It is also used in the manufacture of dyestuffs, such as indigo, in the printing and dyeing of textiles, and in the tanning of leather.

The development of the industry in this country has been inhibited rather than stimulated by the manipulation of patents and licenses. At the turn of the century a synthetic process for making acetic acid was developed. Until then it was made by the destructive distillation of hardwood. During the World War about 1915, synthetic production was begun in Germany, and in Canada at Shawinigan Falls, Quebec. This country's inability to get started in the synthetic acetic acid field was dramatically demonstrated in 1917, after we entered the war. To get the acetic acid required by our war industries the United States Government had to subsidize the construction of a second plant at Shawinigan Falls, Quebec, and rely on the private Canadian manufacturer for this vital material.

A plant producing synthetic acetic acid was not established in this country until the process was patent-free. Consequently, the first commercial plant was not built until 1927, at which time the Niacet Chemicals Co. established such a plant at Niagara Falls. Thus, the United States began the synthetic manufacture of acetic acid 12 years later than Canada and Germany did. Even then such production was apparently possible only with the consent of the Canadian producer, as indicated by the fact that this company became a non-third owner of the Niacet Chemicals Co.

Digitized by Google

The importance of the synthetic process is indicated by the rapidity with which it obtained a dominant position in the industry, once it was given a chance to operate. Synthetic acetic acid was superior in many ways to the wood distillation product and cost less to produce. As a result, many wood distillation plants had to shut down while synthetic production expanded rapidly. In 1927, when the first synthetic plant was built here, over 90 percent of this country's acetic acid production was made by the distillation of hardwood. By 1933 only 40 percent of the acid was made by this method, and in 1937 and 1941 only 22 percent of the Nation's output was so produced. In contrast, synthetic acid production rose from nothing in 1927 to 37½ percent of the Nation's total in 1933, 66 percent in 1937, and 70 percent in 1941. During the last 2 years synthetic production would have been even greater if raw material shortages had not developed.

The introduction of the synthetic process not only resulted in the decline of wood-distillation operations but also helped bring about a net expansion of the acetic acid industry as a whole. From 1927 to 1941 total production of acetic acid almost trebled in this country. This expansion was both a stimulus to and a reflection of the growth in the rayon, plastic, film, and solvents industries. The earlier establishment of the synthetic process in this country might well have meant an even greater development of these important acetic acid industries. Although it is impossible to estimate the extent of the loss to this country because of the retardation of synthetic acid production, the fact that such production boomed once the process was introduced indicates that the problable loss was substantial.

I. G. FARBEN-STANDARD OIL PATENT POOL

Patents were instrumental not only in delaying the establishment of the synthetic acid industry but also in hampering the subsequent development. During the early 1930's, I. G. Farben of Germany held the United States patents on a new and promising process for making acetylene the principal material used in the manufacture of synthetic acetic acid. By an adroit manipulation of these patents and by a clever use of its partnership with Standard Oil of New Jersey, I. G. Farben succeeded in preventing the full development and utilization of that process. How I. G. Farben kept this process on the shelf while the demand for acetic acid was rapidly expanding is a complex but revealing story. It shows how United States patents in the hands of a foreign interest, such as I. G. Farben, become a menace rather than a boom to the chemical progress of this country. It further illustrates the harmfulness of such international partnerships as the chemical patent pool between I. G. Farben and Standard Oil of New Jersey.

In 1930 I. G. Farben and Standard Oil organized a chemical company in the United States called Jasco, Inc., which was to develop and exploit new processes for making chemical products out of natural and refinery gases (exhibit 1). Although this joint venture was ostensibly a partnership, each of the two companies owning a half interest and selecting half the governing board, it was in truth under I. G. Farben's control. Jasco was organized pursuant to a basic understanding consummated in 1929 between Standard Oil and I. G. Farben, which agreement provided that in all chemical ventures I. G. Farben would have the compelling voice and Standard Oil would be the junior partner (exhibit 2). To the outside world, however, Jasco was an American corporation, and since it was half owned by so powerful a company as Standard Oil of New Jersey, it was presumably operating under the influence and guidance of that company. By first getting Standard Oil to accept the status of junior partner and then by giving it a 50-percent interest in Jasco, I. G. Farben was able to establish this chemical company under the camouflage of an American enterprise, and yet was able to operate it for all practical purposes as an I. G. Farben subsidiary.

At the time that I. G. Farben and Standard Oil were negotiating their basic understanding in 1929, the German interests were very outspoken in declaring what their policy would be as to future chemical ventures, such as Jasco. High officials of I. G. Farben told the executives of Standard Oil that—

"It was the policy of I. G. not to go into old fields already occupied but to create new industries and new fields; that the I. G. did not wish to go into competition in the United States with the United States chemical industry" (exhibit 2).

Digitized by Google

Standard Oil was thus put on notice that any chemical venture in this country established jointly with I. G. Farben would have to operate on a noncompetitive basis. This attitude on the part of I. G. Farben necessarily deprived the United States of the benefits to be derived from any patent held by I. G. Farben in this country, if the process covered happened to be competitive with already established chemical processes. As will be shown by subsequent citations from I. G. Farben and Standard Oil files, Jasco's efforts in the acetic acid field were foredoomed because of this fundamental limitation.

One of the first projects undertaken by Jasco was the development of a synthetic rubber process. In 1930 I. G. Farben was of the opinion that acetylene would be the raw material for synthetic rubber, and so it concentrated first on the problem of producing acetylene as cheaply as possible (exhibit 3). Toward that end, an experimental pilot plant was established by Jasco at Baton Rouge, La., for the manufacture of acetylene out of natural or refinery gases by a new electric arc process, which the Germans had originated (exhibit 4). The process was far from perfect, and considerable improvements were made by Jasco's research staff at Baton Rouge (exhibit 4).

Sufficient progress had been made by the fall of 1931 for Standard Oil and I. G. Farben to consider what should be done with the acetylene being produced by the pilot plant. At that time I. G. Farben was not yet ready to make synthetic rubber out of the acetylene being produced at Baton Rouge, nor did it seem at all interested in the marketing of acetylene itself. Standard Oil, however, was a large user of acetic acid in the manufacture of solvents, which was carried on by its subsidiary, Standard Alcohol Co. Since acetylene was the basic ingredient of synthetic acetic acid, Standard Oil urged that the Jasco plant's acetylene be used to make acetic acid.

I. G. Farben finally approved the production of acetic acid at Baton Rouge in October 1931. The Germans regarded it "as expedient, prior to developing a butadiene [synthetic rubber] project, to start operating an acetylene arc process and to keep this process within limited bounds as long as the acetic acid obtained therefrom can be used by Standard for its own purposes" (exhibit 3). This line of reasoning clearly indicates that I. G. Farben was very much interested in staying out of the acetic-acid market. It permitted acetic-acid production only as part of its grand strategy in advancing its own synthetic-rubber project, and not because of any desire to establish Jasco in the acetic-acid field. By limiting the production to Standard's own needs, I. G. Farben was able to try out its acetylene arc process and yet adhere to the principle laid down in 1929, namely, that it would not compete with existing industries in this country.

JASCO TRIES TO SELL SURPLUS ACID WITHOUT UPSETTING THE MARKET

Depression conditions in the early 1930's made it extremely difficult for I. G. Farben at one and the same time to produce acetic acid and yet not disturb the market. Small as Jasco's pilot plant was, its acid output was greater than Standard's requirements during the depression years. Jasco, therefore, had acid to sell, but under the rules laid down by I. G. Farben, such acid had to be disposed of without creating competition in the synthetic-acid market.

The marketing of Jasco's surplus acid was not entrusted to Jasco itself or even to junior partner Standard Oil of New Jersey, which had a Nation-wide sales organization. Instead, I. G. Farben delegated this delicate assignment to Advance Solvents & Chemical Corporation, its American sales agent, in order to make sure that nothing would be done to upset the numerous friendly understandings existing between I. G. Farben and American chemical interests (exhibit 5).

This type of sales control and restriction was particularly valuable because it enabled I. G. Farben to keep American chemicals out of world markets by promising in return to keep its own products and those of its affiliates out of the American market. I. G. Farben's attitude was clearly brought out during the negotiations which culminated in the formation of Jasco in 1930. At that time an I. G. Farben official expressed the view that it was desirable in carrying on negotiations with Standard Oil "to see to it that the sale of new products to be manufactured in the United States in conjunction with Standard be entrusted to our U. S. A. sales organization" (exhibit 6). I. G. Farben was fearful that Standard Oil "will get control of a considerable part of the solvents business. Standard will then be in a position to point out that it possesses a

Digitized by Google

sales organization in the solvents field and that it, therefore, sees no reason to entrust the sale of new products to another firm" (exhibit 6).

As I. G. Farben saw it, if Standard Oil were allowed a free hand in the solvents business, it would be marketing large amoutns of such chemicals in the United States, and increase the competition faced by other American solvents producers. Under such circumstances, I. G. Farben felt that Standard Oil would "make itself felt in the United States in a very disagreeable way" and that such a development would "have the consequence that we will see more of American competitors in the world markets" (exhibit 6). It therefore took every precaution to prevent Standard Oil from creating competitive conditions in United States markets among I. G. Farben's friends. Standard Oil,, by accepting these restrictions, not only helped I. G. Farben maintain its strategic position in the chemical world but also helped it restrict chemical exports from this country to the rest of the world, and in that way restricted the development of the chemical industry generally.

When Advance Solvents was assigned the task of selling Jasco's acetic acid the prospects of this newcomer in the acetic-acid market were very good, judged according to normal business standards. A Jasco report of May 1932 concluded that the Baton Rouge plant was "on a sound economic basis" (exhibit 4). Estimated production costs, using cracked refinery gases, amounted to 2.8 cents per pound, and at that time Standard Oil itself was paying the Niacet Chemical Co. 5.18 cents per pound for its acetic acid, while the normal contract price was believed to be between 6.35 and 6.50 cents per pound. Furthermore, it was emphasized that the acetic acid produced at Baton Rouge was superior to the synthetic acid produced by Niacet, because it contained no mercury and therefore could command a better price. Even though the plant was relatively small, being merely a pilot plant, an annual profit of $225,000 could be realized on the sale of acetic acid produced there.

Despite these promising estimates, I. G. Farben's sales agent proceeded very cautiously in the marketing of the acid. Dr. Hochschwender, I. G. Farben's representative in this country, reported in May 1932 to the home office in Germany that the Advance Solvents people believed that "it will be possible to sell the entire production * * * to two large customers whose acetic acid contracts expire January 1, 1933" (exhibit 5). Dr. Hochschwender also stated that "A good sales argument is the fact that our acetic acid is free from mercury" (exhibit 5). He then inquired as to "whether I. G. has commitments which would stand in the way of Advance Solvents selling the acetic acid in the United States. Please do not forget that Jasco is not identical with I. G., and that therefore I. G. does not appear in the market as a manufacturer" (exhibit 5).

Dr. Hochschwender here reveals the double-dealing attitude of the Germans. On the one hand, from the point of view of their international relations and their comprehensive understandings with giant American chemical companies, I. G. Farben is desirous of keeping them satisfied and of creating an appearance, at least, of living up to its bargain. On the other hand, apparently the I. G. Farben interests were not above trying to make it appear that Jasco is an independent enterprise and therefore not a party to I. G. Farben's obligations to other American chemical companies. I. G. Farben replied that "exports of acetic acid from the United States are undesirable," and that "in view of our general acetic acid business we would ask you not to mention, as a sales argument, the fact that the acetic acid produced in Baton Rouge is free of mercury" (exhibit 7). Thus, right from the outset, the Jasco product was seriously restricted because it could not export and even within this country could not use its strongest selling point, its superiority over other synthetic acetic acid.

I. G. Farben was so concerned about not upsetting the acetic acid market that it kept Union Carbide, its most important competitor in this field, informed of Jasco's development. I. G. Farben reported on July 31, 1933, that:

"Union Carbide had been informed in Germany by the I. G. about a year ago that I. G. is working together with the Standard Oil Company in the Ethylene field in U. S. A. Mention was also made of acetic acid produced from methane in a pilot plant in Louisiana" (exhibit 8).

Again, on July 26, 1933, Davidson, of Union Carbide, in a conversation with vom Rath, of American I. G., asked "how the acetic acid project had progressed, to which Mr. vom Rath replied that, as far as he knew, samples of acetic acid were available now from a semi-commercial plant in Louisiana" (exhibit 8).

The first real effort to sell Jasco acid took place in the summer of 1933. On

Digitized by Google

July 14, 1933, Advance reported that it had submitted samples to three companies explaining that:

"I have been extremely careful in these three contacts to get my friends to keep the matter confidential and not let the trade know we are in the field with Acetic Acid or Acetaldehyde at this time, as I would like to place the desired quantities without disturbing the market if possible" (exhibit 9).

Pursuant to its policy of avoiding any action which established acetic-acid producers would find objectionable, Advance tried to make sure that it was not underselling the market. This was not easy since Niacet, affiliate of du Pont and Union Carbide, dominated the market and gave special inside prices to large contract customers. The following procedure was consequently adopted. Standard, whose contracts expired in 1933, would negotiate a new contract with Niacet for the next year. The price arrived at was "to serve as a guide for the contracts of Advance" (exhibit 10).

The first sale of acetic acid was made by Jasco to Commercial Solvents in July 1933. In order to avoid any possibility of price cutting, Advance asked the Commercial Solvents people what they had been paying for their acid and explained that "they did not desire to underquote the market" (exhibit 11). The sale was then consummated "at the price which they [Commercial Solvents] were then paying" (exhibit 11).

UNION CARBIDE ASSUMES CONTROL OF JASCO'S SURPLUS ACID

Despite all this caution, Advance apparently did disturb Niacet's market. On March 14, 1934, the vice president of Union Carbide complained to an official of General Aniline that "one tank car of acetic acid had been sold lately to one of U. C. C.'s [Union Carbide] largest customers and that quotations for further supplies had been submitted to that customer" (exhibit 12). This Union Carbide official went on to point out that when he was in Frankfurt, Germany, "he was informed that the sales policy of Baton Rouge acetic-acid production would be handled in such a way as not to influence the market" (exhibit 12).

This difficulty was settled with remarkable rapidity. A conference was arranged between the Union Carbide man and a Standard Oil official who was on friendly terms with him. As explained in a memorandum from Chemnyco, I. G. Farben's American agent, to the home office in Germany:

"When the two gentlemen met, Davidson [Union Carbide official] pointed out that U. C. C. controlled approximately 40% of the acetic-acid market in the United States and was very much interested in arranging matters so that the market price for acetic acid would not be disturbed by the small output in Baton Rouge. Dr. Haslam [Standard Oil official] told Davidson that the Baton Rouge plant was a pilot plant and that at the moment had no steady output. It was pointed out to Davidson that U. C. C. had been repeatedly advised of this both here and abroad. He was also told that we had no intention of disturbing the acetic acid market by underselling. Furthermore, he was informed that the capacity of the plant was about 4 tons a day at the moment and might be raised 5.5 tons a day by the end of the year * * * Dr. Davidson was not surprised by these production figures and proposed that the Baton Rouge acetic acid should be sold through U. C. C. U. C. C., he said, was ready to pay the market price less 5% for Jasco's acetic acid. Jasco accepted this proposal, and in another conference among Davidson, McLaughlin (Niacet), and the Advance Solvents & Chemical Corporation it was agreed that henceforth Advance would sell Jasco's acetic acid to Niacet at the market price minus 5%" (exhibit 13).

Niacet thus became the sales agent for Jasco, and that ended all possibility of Jasco acetic acid being sold in competition with the product of Niacet, the only other seller of synthetic acid at that time.

Dr. Hochschwender, in commenting on this solution of the acetic-acid problem, stated that "we believe that in entering this agreement we have acted in the interest of I. G. Farben in order to retain good relations with U. C. C." (exhibit 13). Thus did Jasco, the acetic-acid venture, and necessarily the United States patents covering the arc process, become mere pawns of I. G. Farben in its international game of business politics.

Once a definite understanding had been consummated between Union Carbide and Jasco, the former was quick to clamp down on Jasco's market operations. When the meeting took place in March 1934, Jasco's production was running at only 4 tons per day, but it was expected to reach 8½ tons by the end of the year, and to climb to 13½ tons during 1935 (exhibit 14). Nevertheless, on May 15, 1934, by letter agreement between Advance Solvents, which was still

Digitized by Google

Jasco's sales agent, and Niacet, covering the "disposal of your surplus acetic acid," Niacet undertook to sell "up to a maximum of four tank cars per month, with the exception of your requirements for the Pacific coast" (exhibit 15). This ceiling on the sale of Jasco's surplus acid made its expansion dependent entirely on Standard Oil's ability to absorb any increase in output.

AMERICAN PRODUCERS WERE ISOLATED FROM WORLD MARKETS

I. G. Farben being an international chemical company, just as Standard Oil of New Jersey was an international petroleum company, was interested in keeping for itself the largest possible share of the world markets. For that reason Jasco was not given any opportunity to export its products. When the question of marketing Jasco's acetic acid was first raised, I. G. Farben advised its New York agent that "exports of acetic acid from the United States are undesirable" (exhibit 7). Of course, since Jasco was under I. G. Farben's domination, this expression of the undesirability of such action precluded the possibility of Jasco ever attempting it.

A much more difficult situation developed when the Dutch Shell oil interests were negotiating for a license on behalf of their American chemical subsidiary, the Shell Chemical Co., to enable it to manufacture in the United States acetic, propionic, and formic acids. Although the process differed from Jasco's, it was similar enough in its major respects to come within the scope of the I. G. Farben-Standard Oil of New Jersey partnership. It was first decided that they "would need Standard's consent for reasons of fairness because the process is competitive in a sense with the process for the manufacture of acetic acid from acetylene which has been bought into Jasco" (exhibit 16). However, that obstacle was brushed aside by I. G. Farben because "we are particularly interested to satisfy the Bataafsche Co. in this matter because that might make it possible for us to come to an understanding with the same company in another very important field" (exhibit 16).

Shell, being an international corporation like I. G. Farben, wanted the freedom to operate in world markets, and the question of exports became a sticking point in the negotiations. Shell raised a query as to "whether it is possible under American law to insert a valid export prohibition. I. G. said that the export prohibitions are so important that in case they could not be validly agreed upon, no contract would be signed" (exhibit 17).

I. G. Farben wanted to prevent exports not only by Shell but also by its customers. After long months of haggling, Shell agreed that "if and when it should learn that one of its customers was exporting materials, it would stop supplying this particular customer" (exhibit 18). That was not enough for I. G. Farben. It wanted a clause in the license flatly prohibiting such exports by Shell or its customers. What American law permitted or did not permit mattered not at all to I. G. Farben. They were far more concerned with their obligations as a member of the world cartels in these fields. They wrote Chemnyco in January 1939:

"In view of other agreements we have entered into, we will have to insist that Shell impose an obligation on its customers not to export. In our opinion it should be possible to induce Shell to make such a promise. If for technical reasons it should not be feasible to insert such a clause in the text of the contract, it might perhaps be a good idea to exchange letters on this point" (exhibit 19).

The phrase "technical reasons" was manifestly a euphemism for legal restrictions, and consequently I. G. Farben was here blandly suggesting that what cannot be done in conformance with the law should be carried out by means of sub-rosa agreements which ignore and defy the law of the land. The deadlock was finally broken when Chemnyco convinced its parent that Shell could not legally enforce any such obligation on its customers, and that, therefore, they should issue the license upon Shell's promise "not knowingly to sell to others for export from the United States" (exhibit 20).

The potency of the world cartel in acetic acid was graphically illustrated in August 1934 when some American producer had the temerity to export some acid from New Orleans to England. Niacet, upon learning of this rash act, being "very anxious to find out who made this shipment" (exhibit 21), immediately got in touch with I. G. Farben's sales agent, Advance Solvents. As I. G. Farben's agents explained to Standard Oil in passing the query along, Niacet was worried because "this disturbs the whole international acetic acid situation and,

Digitized by Google

July 14, 1933, Advance reported that it had submitted samples to three companies explaining that:

"I have been extremely careful in these three contacts to get my friends to keep the matter confidential and not let the trade know we are in the field with Acetic Acid or Acetaldehyde at this time, as I would like to place the desired quantities without disturbing the market if possible" (exhibit 9).

Pursuant to its policy of avoiding any action which established acetic-acid producers would find objectionable, Advance tried to make sure that it was not underselling the market. This was not easy since Niacet, affiliate of du Pont and Union Carbide, dominated the market and gave special inside prices to large contract customers. The following procedure was consequently adopted. Standard, whose contracts expired in 1933, would negotiate a new contract with Niacet for the next year. The price arrived at was "to serve as a guide for the contracts of Advance" (exhibit 10).

The first sale of acetic acid was made by Jasco to Commercial Solvents in July 1933. In order to avoid any possibility of price cutting, Advance asked the Commercial Solvents people what they had been paying for their acid and explained that "they did not desire to underquote the market" (exhibit 11). The sale was then consummated "at the price which they [Commercial Solvents] were then paying" (exhibit 11).

UNION CARBIDE ASSUMES CONTROL OF JASCO'S SURPLUS ACID

Despite all this caution, Advance apparently did disturb Niacet's market. On March 14, 1934, the vice president of Union Carbide complained to an official of General Aniline that "one tank car of acetic acid had been sold lately to one of U. C. C.'s [Union Carbide] largest customers and that quotations for further supplies had been submitted to that customer" (exhibit 12). This Union Carbide official went on to point out that when he was in Frankfurt, Germany, "he was informed that the sales policy of Baton Rouge acetic-acid production would be handled in such a way as not to influence the market" (exhibit 12).

This difficulty was settled with remarkable rapidity. A conference was arranged between the Union Carbide man and a Standard Oil official who was on friendly terms with him. As explained in a memorandum from Chemnyco, I. G. Farben's American agent, to the home office in Germany:

"When the two gentlemen met, Davidson [Union Carbide official] pointed out that U. C. C. controlled approximately 40% of the acetic-acid market in the United States and was very much interested in arranging matters so that the market price for acetic acid would not be disturbed by the small output in Baton Rouge. Dr. Haslam [Standard Oil official] told Davidson that the Baton Rouge plant was a pilot plant and that at the moment had no steady output. It was pointed out to Davidson that U. C. C. had been repeatedly advised of this both here and abroad. He was also told that we had no intention of disturbing the acetic acid market by underselling. Furthermore, he was informed that the capacity of the plant was about 4 tons a day at the moment and might be raised 5.5 tons a day by the end of the year * * * Dr. Davidson was not surprised by these production figures and proposed that the Baton Rouge acetic acid should be sold through U. C. C. U. C. C., he said, was ready to pay the market price less 5% for Jasco's acetic acid. Jasco accepted this proposal, and in another conference among Davidson, McLaughlin (Niacet), and the Advance Solvents & Chemical Corporation it was agreed that henceforth Advance would sell Jasco's acetic acid to Niacet at the market price minus 5%" (exhibit 13).

Niacet thus became the sales agent for Jasco, and that ended all possibility of Jasco acetic acid being sold in competition with the product of Niacet, the only other seller of synthetic acid at that time.

Dr. Hochschwender, in commenting on this solution of the acetic-acid problem, stated that "we believe that in entering this agreement we have acted in the interest of I. G. Farben in order to retain good relations with U. C. C." (exhibit 13). Thus did Jasco, the acetic-acid venture, and necessarily the United States patents covering the arc process, become mere pawns of I. G. Farben in its international game of business politics.

Once a definite understanding had been consummated between Union Carbide and Jasco, the former was quick to clamp down on Jasco's market operations. When the meeting took place in March 1934, Jasco's production was running at only 4 tons per day, but it was expected to reach 8½ tons by the end of the year, and to climb to 13½ tons during 1935 (exhibit 14). Jasco's sales agent, and Niacet, covering the "disposal of your surplus acetic acid," Niacet undertook to sell "up to a maximum of four tank cars per month, with the exception of your requirements for the Pacific coast" (exhibit 15). This ceiling on the sale of Jasco's surplus acid made its expansion dependent entirely on Standard Oil's ability to absorb any increase in output.

AMERICAN PRODUCERS WERE ISOLATED FROM WORLD MARKETS

I. G. Farben being an international chemical company, just as Standard Oil of New Jersey was an international petroleum company, was interested in keeping for itself the largest possible share of the world markets. For that reason Jasco was not given any opportunity to export its products. When the question of marketing Jasco's acetic acid was first raised, I. G. Farben advised its New York agent that "exports of acetic acid from the United States are undesirable" (exhibit 7). Of course, since Jasco was under I. G. Farben's domination, this expression of the undesirability of such action precluded the possibility of Jasco ever attempting it.

A much more difficult situation developed when the Dutch Shell oil interests were negotiating for a license on behalf of their American chemical subsidiary, the Shell Chemical Co., to enable it to manufacture in the United States acetic, propionic, and formic acids. Although the process differed from Jasco's, it was similar enough in its major respects to come within the scope of the I. G. Farben-Standard Oil of New Jersey partnership. It was first decided that they "would need Standard's consent for reasons of fairness because the process is competitive in a sense with the process for the manufacture of acetic acid from acetylene which has been bought into Jasco" (exhibit 16). However, that obstacle was brushed aside by I. G. Farben because "we are particularly interested to satisfy the Bataafsche Co. in this matter because that might make it possible for us to come to an understanding with the same company in another very important field" (exhibit 16).

Shell, being an international corporation like I. G. Farben, wanted the freedom to operate in world markets, and the question of exports became a sticking point in the negotiations. Shell raised a query as to "whether it is possible under American law to insert a valid export prohibition. I. G. said that the export prohibitions are so important that in case they could not be validly agreed upon, no contract would be signed" (exhibit 17).

I. G. Farben wanted to prevent exports not only by Shell but also by its customers. After long months of haggling, Shell agreed that "if and when it should learn that one of its customers was exporting materials, it would stop supplying this particular customer" (exhibit 18). That was not enough for I. G. Farben. It wanted a clause in the license flatly prohibiting such exports by Shell or its customers. What American law permitted or did not permit mattered not at all to I. G. Farben. They were far more concerned with their obligations as a member of the world cartels in these fields. They wrote Chemnyco in January 1939:

"In view of other agreements we have entered into, we will have to insist that Shell impose an obligation on its customers not to export. In our opinion it should be possible to induce Shell to make such a promise. If for technical reasons it should not be feasible to insert such a clause in the text of the contract, it might perhaps be a good idea to exchange letters on this point" (exhibit 19).

The phrase "technical reasons" was manifestly a euphemism for legal restrictions, and consequently I. G. Farben was here blandly suggesting that what cannot be done in conformance with the law should be carried out by means of sub-rosa agreements which ignore and defy the law of the land. The deadlock was finally broken when Chemnyco convinced its parent that Shell could not legally enforce any such obligation on its customers, and that, therefore, they should issue the license upon Shell's promise "not knowingly to sell to others for export from the United States" (exhibit 20).

The potency of the world cartel in acetic acid was graphically illustrated in August 1934 when some American producer had the temerity to export some acid from New Orleans to England. Niacet, upon learning of this rash act, being "very anxious to find out who made this shipment" (exhibit 21), immediately got in touch with I. G. Farben's sales agent, Advance Solvents. As I. G. Farben's agents explained to Standard Oil in passing the query along, Niacet was worried because "this disturbs the whole international acetic acid situation and,

Digitized by Google

if such shipments continue, the foreign manufacturers are likely to start shipping the material in this direction and hurt the market" (exhibit 21). They then asked Standard Oil, "Should you be in a position to learn through your Louisiana company who made the shipment, we could be of service to Niacet who would greatly appreciate this cooperation" (exhibit 22). Standard Oil of Louisiana did find out who the culprit was, a wood-distillation producer. It thereby helped I. G. Farben and its fellow cartel members police the world marketing of acetic acid which meant, in this instance, keeping the American product out of foreign lands.

The effectiveness of the export prohibitions imposed by I. G. Farben and the world cartel is demonstrated by this country's official export statistics. They were practically nonexistent from 1927 to 1939, amounting to only one-fourth of 1 percent of domestic production during those years (exhibit 23). No exports at all were reported for 1927 and for the 6-year period. 1929 through 1935. Not until the war came in 1939, with its resultant blockade and shortages, did American producers dare to step into Latin-American and other foreign markets. During 1939 exports were almost as large as the combined total for the previous 12 years, and in 1940 they were three times as large. Even in 1941, with our own domestic demand rising rapidly, exports were still growing. There can be no doubt that the failure of American producers to sell abroad was the result of understandings with I. G. Farben and other foreign cartel members.

By depriving this country of peacetime exports, productive capacity was kept down in this country to the level of local requirements. When the defense and war production programs were initiated here, the United States was at a distinct disadvantage as against Germany and other foreign countries. It had no safety margin of export production and capacity to meet the rapidly growing demands at home. Germany and other foreign producers who were active in world markets had substantial capacity which ordinarily produced for export, but with the coming of war was immediately available for their own war demands.

I. G. FARBEN SHUTS DOWN JASCO'S ACETIC ACID PLANT

Coming back to the domestic situation, Union Carbide's assumption of direct control of the sale of Jasco's acetic acid marked the beginning of the end of the Baton Rouge project. I. G. Farben decided to come to a full understanding with Union Carbide as to the Baton Rouge plant, and even as to the acetylene arc process. At a conference held in Germany between I. G. Farben and Standard Oil officials on May 3, 1935, "it was decided to interrupt the experiments at Baton Rouge, and at once to undertake negotiations wtih U. C. C. In addition an effort will be made to issue licenses to other interested parties, such as du Point, in which case du Pont will have to be restricted to the production of acetylene for its own use, so as not to come into conflict with U. C. C.'s interests" (exhibit 24).

For the first time in the history of the Jasco project, Standard Oil dissented from I. G. Farben's decision. It balked at this effort to shut down the Jasco plant completely because "it did not want to lose its acetic acid customers" (exhibit 25). I. G. Farben ignored Standard Oil's viewpoint, contending that it was not "in the interests of Jasco and I. G." to continue operating the Baton Rouge plant (exhibit 25).

Both parties finally agreed on a compromise arrangement. Jasco was to continue operating the plant provided all costs in excess of $7,277 were borne by Standard Oil alone (exhibit 26). I. G. Farben continued of course to dictate Jasco policy, even though it no longer shared its expenses equally. Furthermore, to prevent Standard Oil from getting the full benefits of the acetylene arc process at Baton Rouge, it was agreed that "experiments, insofar as such cannot possibly be undertaken in the plant in operation, are to be restricted to a minimum" (exhibit 26).

Jasco was permitted to continue operating, not because Standard Oil wished it but because, on second thought, I. G. Farben decided "that it is desirable to keep the entire plant in operation while negotiations with U. C. C. and du Pont are going on" (exhibit 27). Union Carbide inspected the Baton Rouge plant in June and July of 1935 and found the process "of interest to them, not only for acid but probably also for other products" which can be made out of acetylene (exhibit 27). Union Carbide wanted to acquire the rights to this process even though they felt the patent situation so weak that it was "not strong enough to prevent others from developing similar competitive processes" (exhibit 27). Union Carbide's interest in the Jasco process, as expressed by their vice presi-

Digitized by Google

dent, arose out of "their desire to prevent disturbance in the market by a new process" (exhibit 27). A Standard Oil official corroborated this view with the comment that "it would seem that Carbide and Carbon's position on the arc process would be that it is necessary for them to acquire the process as a protective measure" (exhibit 28). This admission coming from the company most likely to be affected by the exploitation of the Jasco process testified to the important role which this process could have played in the synthetic acid industry in this country.

Negotiations between Union Carbide and I. G. Farben collapsed in September 1935 because Union Carbide did not regard "participation in the expansion of the Baton Rouge plant as very essential; and, secondly, that too close a connection between the two groups in a field of such importance to Union Carbide was not regarded by the latter as desirable" (exhibit 29). I. G. Farben had apparently hamstrung Jasco so effectively that Union Carbide was confident that the Baton Rouge plant would never be permitted to disturb the market.

The negotiations with du Pont on the Jasco process apparently were also unfruitful (exhibit 30). From I. G. Farben's viewpoint, when both of these negotiations terminated, there was no longer any reason for the Baton Rouge plant to continue operating. Accordingly, despite the May 1935 understanding between I. G. Farben and Standard Oil, the Baton Rouge plant ceased production in 1935 and never resumed operations again (exhibit 31).

JASCO PLANT WAS NOT CLOSED BECAUSE OF LEGITIMATE BUSINESS CONSIDERATIONS

Apologists for I. G. Farben claim that the Baton Rouge plant was shut down because it had proven to be a failure. It will be recalled that only a pilot plant had been set up at Baton Rouge, which did not at all reflect the economies of commercial scale operation. During the July 1935 negotiations with Union Carbide, I. G. Farben tacitly admitted that the pilot plant then in existence was not large enough for economical operation. I. G. Farben wanted to preserve rights under the Jasco process because Jasco "desired, by expanding the capacity to an economical size, to obtain, within a reasonable time, compensation for this investment from the profits expected (exhibit 27). This statement also revealed that I. G. Ferben had confidence in the profitablity of a commercial-sized plant. Standard Oil was of like mind, having concluded late in 1934 that "considerably greater profits can be realized by increasing the capacity" of the plant "to twice its present size" (exhibit 32).

Standard Oil also rated the Jasco process very highly at the time the Baton Rouge plant came to a halt in 1935. For example, Standard Oil reasoned that if Union Carbide acquired rights to the process they would not use it immediately but reserve it for future use "where appreciable expansion of capacity is required. Carbon and Carbide, from the standpoint of protection, should be willing to pay a reasonable amount, say $250,000 or $500,000, for acquiring the rights to use the process and also to have some control over its use" (exhibit 28).

In July 1935, Standard Oil made an analysis of the comparative costs of producing acetylene and acetic acid by the Jasco process at Baton Rouge and by the Niacet and Union Carbide processes than in use. With allowances for power costs 50 percent higher than those of Union Carbide and on the basis of a plant one-fourth as large as that of Union Carbide, the Jasco process could produce acetylene 25 percent cheaper and acetic acid at practically the same cost as that realized by Niacet and Union Carbide (exhibit 28). Standard Oil contended in this report that, on the basis of these cost estimates, "it is clear that Niacet cannot compete with an arc [Jasco] process at the same scale of production and the same power cost." Under these conditions, the Jasco process would cut the cost of producing acetylene in half, and reduce acetic acid costs by a third (exhibit 28). Again in September 1935, Standard Oil reported that "it has now been very definitely indicated that the production of acetic acid from arc gas acetylene is fundamentally cheaper than from acetylene derived from calcium carbide" (exhibit 33).

As late as October 1935, Standard Oil stated that "we believe that the Baton Rouge E project has a good chance of turning out to be the lowest cost acetylene producer in the world. We propose to put this E project into definite commercial form within the next few months by enlarging the plant into a 20- or 30-ton per day acetic acid plant" (exhibit 34).

The expansion of the plant, as suggested by Standard would not have required any tremendous sales drive. A 20-ton per day plant would account for only 10 percent of the Nation's consumption at that time. No price war would

Digitized by Google

have ensued if this new production did come into the market because, as Hochschwender wrote I. G. Farben,

"It is hardly to be expected, however, that Shawinigan, in order to compete against our product, will lower its selling price in the United States. This is not likely in the first place, because our volume of production is too insignificant, and, in the second place, because the American manufacturers, who are united with Shawinigan in Niacet, probably will not follow Shawinigan in a price reduction" (exhibit 34).

Standard Oil's estimates of September 1935 indicated that expansion of the pilot plant to a 30-ton per day acetic acid plant would have been extremely profitable. Such expansion would require an additional investment of $800,000 but costs would be 25 percent lower than in the pilot plant (exhibit 33). Assuming a selling price for the acid of 5 cents per pound, which is conservative, $442,000 profit would be realized annually. This "represents a pay-off on the additional investment required in less than two years, and a pay-off on the total plant investment in a little over three years" (exhibit 33).

Long after the Jasco plant was shut down, Standard Oil continued to see a promising future for the process. In January 1936 they stated that "we are planning some time this year to expand the capacity of our acetic acid plant at Baton Rouge to 30 tons per day. We believe our process for making acetic acid * * * is the cheapest existing process" (exhibit 35). Again in June 1936, Standard Oil told the Tennessee Eastman Corporation, a large consumer of acetic acid, that "we expected to expand our plant to a capacity of 30 tons per day and might later want to expand up to 60 tons per day or even higher" (exhibit 36).

I. G. FARBEN HAMPERS JASCO'S RESEARCH IN THE UNITED STATES

It will be recalled that under the compromise agreement of May 1935, by which Standard Oil could continue operating the plant, it was prohibited from conducting experiments with the process, except such as can be carried on incidental to actual operation. Since the plant never did start up again, that meant the end of all further research on the process in this country. Standard Oil's subsequent dependence on German research is revealed in a company letter of June 1936. It is there reported that "following the break-down of the Carbide & Carbon negotiation it was determined to await the completion of the I. G.'s acetic acid plant in Germany before deciding whether and on what scale to proceed with the enlargement of our own Baton Rouge plant. The I. G. plant is just now in operation and so far as we know is satisfactory" (exhibit 37).

At Baton Rouge, the research had been conducted by a Jasco staff which was composed of both Standard Oil and I. G. Farben people. But in Germany, I. G. Farben conducted its research without the direct participation of Standard Oil technicians. The results of such research were available to Standard Oil only insofar as I. G. Farben saw fit to report them. In that connection, it is significant that Standard Oil cautiously qualified its reference to the progress being made in Germany with the phrase, "so far as we know."

I. G. Farben apparently made no pretense of keeping Standard Oil, or even Jasco, up to date on the German research being done on the acetylene and acetic acid process. In August 1937, Japanese interests contacted I. G. Farben for information about the Jasco acetylene process. I. G. Farben thereupon asked Standard Oil to be permitted to handle the negotiations, instead of Jasco, because I. G. Farben already has had dealing with the Japanese "and in view of the fact that I. G. have the latest experience on this subject collected in their Leuna plant" (exhibit 38). Standard Oil agreed, and thus I. G. Farben was in a position to tell the Japanese more about the process and techniques than it was revealing to its American junior partner, Standard Oil, without the latter being any the wiser of it.

While I. G. Farben pursued its research activities in Germany unhampered by its Standard Oil ties, it very definitely discouraged similar research in this country, even when it was to be done through the jointly owned Jasco. In June 1937, Standard Oil suggested to Jasco at Baton Rouge that experimentation be conducted on a British process for making certain acetylene products. When I. G. Farben's representatives were asked to consent to such a study, they replied that I. G. Farben had a similar process in its laboratories, and "therefore, under the circumstances," they did "not deem it expedient for Jasco to undertake laboratory experiments in this direction" (exhibit 39). Standard Oil accepted this edict without any show of resistance and within a week wrote to its Baton Rouge

Digitized by Google

people that in view of I. G. Farben's objections and "since any work we would ordinarily do would come under the Jasco field, I suggest that we abandon the problem for the present" (exhibit 40).

The one-sided operation of the Jasco partnership was revealed once more to Standard Oil in 1938 when Shell was negotiating with I. G. Farben for a license to make acetic acid by a process different from that used by Jasco. Five years earlier Dr. Hochshwender had written to Standard Oil "pointing out process in question of interest to Jasco and requesting information * * * to permit further study of possibilities by I. G. Farben in Germany" (exhibit 41). Despite Standard Oil's cooperation, I. G. Farben held in 1938 that the process was out of the purview of Jasco. Standard Oil protested against this view on the rather plausible ground that after helping I. G. Farben with the process, they "do not see that subsequent failure of I. G. Farben to advise Jasco of further experimentation work conducted in Germany and outlined to Shell by I. G. Farben removes process from Jasco fields" (exhibit 41). After this outburst I. G. Farben agreed to make some disclosures as to the process but it never did go to Jasco (exhibit 42). Instead the United States patents were sold in 1940 to General Aniline and Film, then an affiliate of I. G. Farben (exhibit 43).

In contrast to the alleged theoretical benefits which American companies claim accrue to this Nation by virtue of their foreign ties, these incidents show that in practice those advantages often did not materialize. Instead, our own research efforts were stifled and we became dangerously dependent on foreign research.

I. G. FARBEN KEEPS THE JASCO PROCESS EQUIPMENT A GERMAN SECRET

I. G. Farben also did its best to keep Standard Oil, and consequently the United States, entirely dependent on Germany for the most modern electrical equipment required by the acetylene arc process. When Jasco was being organized in 1930, I. G. Farben agreed with a large German equipment manufacturer, Brown Boveri & Co., that neither would reveal the trade secrets of the other, and I. G. Farben would buy its equipment from this company. Standard Oil accepted the obligations of this agreement, thereby making Jasco completely dependent on Germany for its electrical machinery. By agreeing "not to make available to any competitor of Brown Boveri any data or experience which, based on these tests, will be useful in the construction of an electric rectifier plant for the operation of direct current arc furnaces in gases," Standard Oil made Jasco dependent on Germany for replacement and repair parts as well as the original installation (exhibit 44).

The question of repairs did come up in November 1932, when Allis-Chalmers, an American associate of Brown Boveri, sought the Baton Rouge plant design "to be able later on to manufacture repair parts for this plant" (exhibit 45). Standard Oil inquired of I. G. Farben whether or not it could submit the design to this American electric company. Chemnyco, acting on behalf of I. G. Farben, turned down Standard Oil's request, even though it admitted that such an arrangement would be advantageous for the Baton Rouge plant, and despite the fact that this American company was connected with the Brown Boveri people. They rejected the idea on the ground that "there is less likelihood that Brown Boveri of Mannheim will import to competitors of ours the experience gained in conjunction with us than there would be in the case of Allis Chalmers, with which company neither Standard nor I. G. has so far had close business relations" (exhibit 45).

I. G. Farben endorsed the views of Chemnyco, stating that "such designs must under no circumstances be handed over to Allis-Chalmers" (exhibit 46). Its refusal to let Allis-Chalmers gain access to the plant design was not founded on its legal obligations under the Brown Boveri agreement, because that agreement was never ratified. In fact, less than a month after this refusal, I. G. Farben took the position that the "ratification of this agreement would at the present time offer no advantages to us and would only handicap our operations. In case of the use of rectifier apparatus for arc purposes, cooperation with other firms, in addition to B. B. C., would be desirable" (exhibit 47).

I. G. Farben then emphasized that the patent situation "is so confused that we do not wish to preclude further developments by assuming rigorous obligations in this field" (exhibit 47). The pact of secrecy between I. G. Farben and Brown Boveri, therefore, operated only to prevent American companies from gaining knowledge of the Jasco process and its equipment, but did not in any way limit I. G. Farben's activities in Germany.

Digitized by Google

With the complete shut-down of the Baton Rouge plant in 1935, the equipment question became academic. In September 1938, I. G. Farben once again approached Standard Oil with the proposal that Standard Oil enter a new restrictive agreement, along with I. G. Farben and Brown Boveri. An improved type of rectifier had been developed in Germany by I. G. Farben and Brown Boveri "which is held to be greatly superior to the old device on which the E plant (Baton Rouge) was run" (exhibit 48). Unfortunately, however, I. G. Farben and Brown Boveri could not find any patent basis in the United States for a restrictive agreement, and so they sought the aid of I. G. Farben's American junior partner. As I. G. Farben explained to Standard Oil:

"It was proposed to seek broad patent protection for the new combination, but the fact of the long existing knowledge of the electric arc oven and of its characteristics has proved to make the procuring of such protection difficult. I. G. has one pending United States application which will be obtained with rather narrow claims. The agreement is therefore drawn from the viewpoint that the details of the new rectifier should be kept secret as much as possible. This is believed to be particularly in the interest of Jasco, due to the limited protection afforded by the aforementioned United States application" (exhibit 48).

Standard Oil indicated that it had no objection to the proposed agreement provided it does not prevent "I. G. from supplying Jasco with such information as it may need for its own use of this equipment" (exhibit 49). In this way, Standard Oil let I. G. Farben maintain a strategic hold over the equipment necessary for the Jasco process, despite the fact that its patent situation in this country was admittedly weak. Standard Oil's acquiescence in this arrangement is particularly significant, in view of the fact that it had contributed half the cost of developing this improved type of rectifier (exhibit 50).

I. G. FARBEN PREVENTED THE PRODUCTION AT BATON ROUGE OF OTHER ACETYLENE PRODUCTS

The 1935 shut-down of the Baton Rouge plant was precipitated because the acetic-acid production tended to interfere with I. G. Farben's international relationships. However, since the process actually produced acetylene in the first instance, products other than acetic acid could have been made at Baton Rouge and I. G. Farben permitted such developments. From the very inception of the Baton Rouge enterprise, Standard Oil had attempted to get I. G. Farben's permission to produce acetylene products other than acetic acid. In fact, when Standard Oil first suggested that acetic acid be produced there, back in September 1931, it at the same time submitted the idea that the plant could be subsequently expanded to provide for the production of acetaldehyde resins, vinyl acetate, ethyl acetate, acetic acid anhydride, and monochlor acetic acid (exhibit 3). I. G. Farben responded to this proposal by informing its New York agent, Chemnyco, that with respect to these acetylene products, "we shall be very glad to give you a list of our American patents and to examine the question as to which of those products may be manufactured in America by Standard without affecting our export interests" (exhibit 51). As used by I. G. Farben, "export interests" referred to its international agreements with chemical companies all over the world and not literally to commodity exports.

As to any one of the chemicals suggested by Standard Oil, the existence of an international restrictive agreement to which I. G. Farben was a party would have precluded the possibility of Jasco's entrance into that field on an unrestricted basis. For example, with respect to monochlor acetic acid, which is one of the products referred to, I. G. Farben had this to say: "Monochlor acetic acid is of interest only with a simultaneous production of indigo and is being manufactured and used in the United States by Dow, du Pont, and Naco. Additional manufacture of monochlor acetic acid might bring new outsiders into the indigo field and might, therefore, affect our agreements in the dyestuff field in America (exhibit 3). It therefore concluded, and so informed Standard, that "In view of agreements existing between I. G. and the other members of the European dyestuffs cartel on the one hand and the three American firms manufacturing indigo on the other hand, ter Moor (I. G. Farben executive) feels that our process for the manufacture of monochlor acetic acid should not be brought into Jasco" (exhibit 52). United States patents covering I. G. Farben's monochlor acetic acid processes were therefore only a means of protecting I. G. Farben's cartel interests and helped prevent the development of competition not only in this kind of acid but also in dyestuffs.

Digitized by Google

This decision is in line with an earlier comment, made by Chemnyco to I. G. Farben in a letter of November 1931, with respect to the prospects for branching out at Baton Rouge beyond the manufacture of acetic acid.

"Only superficial discussions have been held with Standard about the manufacture of products other than acetic acid. In view of the complicated nature of the problem caused by the great variety of our interests we think it expedient to broach this question today. We had no thought of handing over to Standard technical details and important figures relating to the various processes * * *" (exhibit 53).

It is of considerable significance that I. G. Farben did not take Standard Oil into its confidence with respect to its "great variety" of interests, and for that reason did not discuss freely with Standard Oil the technical details and essential facts pertaining to the production of acetylene derivatives other than acetic acid.

Another illustration of how I. G. Farben viewed this partnership with Standard Oil is reflected by its reasoning with respect to butanol. It first decided that since the American market was glutted and there were large surpluses on hand, it was not an attractive export market from the viewpoint of I. G. Farben's German plants. Consequently, "from this angle there are no objections to taking up manufacture in the United States" (exhibit 3). That apparently took care of the export interests in the literal sense of the term, but there were other complications. I. G. Farben was disturbed by the fact that "the amicable relations between I. G., Union Carbide, and Chemical Solvents [two of the three largest butanol producers in the United States] might suffer therefrom, which in turn may result in a very disagreeable price war in European markets" (exhibit 3). I. G. Farben therefore concluded that "it is not in the interest of Standard and I. G. to go into the manufacture of synthetic butanol" as long as the market "suffers from the small consumption of this product by the automobile industry" (exhibit 3). There is no indication that Standard Oil's interest was at all considered, since the decision was based on the fact that entry into the butanol field might increase competition in I. G. Farben's markets. For similar reasons, I. G. Farben decided against the manufacture of acetone, which is fermented butanol, and which is an essential ingredient of explosives (exhibit 3). Thus, except for acetic acid, I. G. Farben turned down Standard Oil with respect to every other acetylene derivative.

Late in 1934, Standard Oil tried once more to induce I. G. Farben to permit Jasco to enter the production of acetylene products other than acetic acid. It argued at that time that "considerably greater profits can be realized by increasing the capacity" of the Baton Rouge acetylene plant "to twice its present size" (exhibit 32). Such expansion would require only a modest amount of additional investment, and "practically no additional labor will be required for the operation at twice present capacity" (exhibit 32). Standard Oil conceded to I. G. Farben that if all the additional acetylene capacity were converted into acetic acid "considerable disturbance of the acetic acid market may occur, since under these conditions we will be producing about 20 percent of the acetic acid sold in this country" (exhibit 32). Accordingly, Standard Oil suggested that inquiry be made "to see if other materials which can be made from acetylene may offer a more desirable outlet for the additional acetylene produced by doubling plant capacity" (exhibit 32).

This renewed request fared no better than the first. There was little likelihood that I. G. Farben would permit Jasco to make acetylene products by virtue of the fact that Union Carbide and Niacet manufactured and marketed many of these chemicals. The policy with respect to acetic acid was applied with equal vigor to all other acetylene products. For example, in March 1934, I. G. Farben opposed the sale of acetaldehyde, which was being manufactured at Baton Rouge as an intermediate product in the conversion of acetylene to acetic acid. Du Pont was interested in purchasing this chemical, but apparently I. G. Farben opposed such sale for some superficial reason. Shortly after this transaction was frustrated, Dr. Hochschwender in New York wrote to I. G. Farben's representative at Baton Rouge as follows: "I should like to advise you of our real reason for refusing to sell acetaldehyde to du Pont. The reason is that, at the moment, we do not wish to disturb the market by offering acetaldehyde" (exhibit 54).

I. G. Farben was fully appreciative of "Standard's desire to expand its plant as well as to find new outlets for the acetylene manufactured at such a low cost" (exhibit 55). It just happened that there were other considerations which I. G. Farben rated higher than its partnership with Standard Oil or the welfare of

Digitized by Google

Jasco. When I. G. Farben considered the possibilities of manufacturing at Baton Rouge vinylchloride, an important plastic material, it reasoned as follows:

"As a general principle the bringing of a process into Jasco has the result that all of our rights outside of Germany fall to Jasco and thereby are withdrawn from our direct influence. We cannot tolerate such a situation in view of the significance which we attach to the M. P. and P. C. materials. There is a possibility that products which we offer at the moment only for special purposes may, at some future time, become substitutes for celluloid. There is the probability that in view of the existing difficulties in world trade we may want to begin to manufacture those products in England, France, Italy, etc. It goes without saying that for this reason we must reserve full liberty of action for the I. G. and should not become dependent upon Jasco" (exhibit 55).

A leading I. G. Farben official also objected to granting permission to Jasco to manufacture this plastic chemical because the process might be a valuable pawn in I. G. Farben's negotiations with du Pont over synthetic rubber. He told his colleagues that "until such time as the synthetic rubber question will be clarified (the question being whether butadiene or Duprene is the better product) I want to reserve the field of vinylchloride, in the event that Duprene should prove to be the superior product. In that event du Pont would no longer be interested in an exchange of experience in the narrower field of synthetic rubber and we would have to have available another bargaining object in order to induce du Pont to license its German Duprene patents" (exhibit 55).

Manifestly the Jasco arrangement did not bring to this country any processes which I. G. Farben would not have otherwise brought here.

The market for acetylene products, such as vinylchloride, was so promising that even outsiders saw the possibilities of the Baton Rouge plant. Röhm & Haas, an American plastic company which already had friendly relations with I. G. Farben, inquired in August 1937 as to whether Jasco could supply it with the raw materials for vinylchloride (exhibit 56). I. G. Farben decided that "it would not be desirable to have Röhm & Haas began to manufacture this product because it is the basic material for artificial fabrics about which we are negotiating with du Pont at the moment (exhibit 56).

No matter what the chemical, I. G. Farben seemed to have already agreed with other chemical interests that it would not encourage its manufacture in the United States. Röhm & Haas also sought Jasco acetylene for the manufacture of cyanide products in 1937, but I. G. Farben had to refuse because it was already trying to negotiate du Pont into taking a license, and, secondly, it was a member of the world cartel on cyanide.

"It would be contrary to the spirit [of the cartel] for I. G. to lend its aid in putting up an additional cyanide plant. The American parties to this agreement, namely, American Cyanamid Company and duPont, will be very much interested in supplying a large consumer such as Rohm & Haas. The intended Baton Rouge plant could, therefore, be built only with the consent of these firms, which consent could probably be obtained only by making concessions concerning the cyannatrium quota" (exhibit 56).

How the corporate mind of I. G. Farben operates was clearly revealed when it had to decide, back in 1936, whether or not Standard Oil should be allowed to produce acetic anhydride. This chemical, which is a dehydrated form of acetic acid, is one of the most important chemicals made from acetylene. In response to an inquiry, Standard Oil informed the Western Cartridge Co. on January 30, 1936, that "we should be able to supply your needs of acetic anhydride at as low a price as anyone else. We have made some very rough estimates which would indicate that we could supply acetic anhydride at a price of 8 to 10¢ per pound at Baton Rouge for the scale now contemplated. With larger scale of operation, this price could undoubtedly be somewhat lowered. We are sending to Germany for additional information on acetic anhydride production and will be able to talk firmer figures in about three to four weeks" (exhibit 35).

The "production" information sought by Standard Oil in "Germany" was an inquiry addressed to I. G. Farben as to whether its prior commitments preclude the possibility of Standard Oil getting a license to make anhydride for Western Cartridge (exhibit 57).

I. G. Farben was in a predicament because it had no ready excuse for refusing such a license to Jasco, especially since the break-down of negotiations with Union Carbide a few months earlier. Negotiations were pending with Hercules Powder Co. for a nonexclusive license, but that would not have pre-

Digitized by Google

cluded the issuance of another nonexclusive license to Standard Oil. Rather than consent to Standard Oil's entry into this field and thus revive the Jasco plant, I. G. Farben remained silent and ignored the query.

Two months later, I. G. Farben was stirred to action when Hercules Powder also asked Standard Oil whether it could supply anhydride. Chemnyco, in New York, was informed of this request on March 31, 1936, and immediately cabled the information to Germany. The next day, April 1, I. G. Farben wrote to Dr. Hockschwender, setting forth their position:

"We must take into consideration our relations to various other American firms in determining whether we should assist Standard Oil in manufacturing acetic acid anhydride for the supply of Western Cartridge Company. Dr. ter Meer and the Patent Division agree with us that I. G. is not prohibited by any agreements from giving Standard a license under one of its processes for the manufacture of acetic acid anhydride. Acetic acid anhydride does not belong to the products wihch come within our agreement with U. C. C.; moreover, in the license agreement drafted with Hercules Powder, it has been stipulated only to give Hercules an option for a nonexclusive license" (exhibit 58).

Unable to find a real reason for refusing a license to Standard Oil, I. G. Farben then proceeded to weave an elaborate pattern of excuses for delaying the granting of a license. Disregarding the fact that Hercules did "not intend for the time being, to manufacture this product themselves," and ignoring the fact that Hercules was seeking anhydride from Standard Oil, I. G. Farben insisted on seeing Hercules as a potential objector to a Standard Oil license. They reasoned that since "acetic acid anhydride is used almost exclusively for the manufacture of acetyl cellulose and constitutes an essential cost item in the manufacture of this latter product, Hercules would probably regard it as very disturbing if we assisted Western Cartridge Company indirectly in taking up the manufacture of acetyl cellulose, by giving Standard a license under our acetic acid process. If we granted Standard such a license, Hercules might hesitate to sign the draft license agreement. Dr. ter Meer considers it as expedient, therefore—and we agree with him—to postpone answering Standard's inquiry until the license agreement with Hercules has been signed. In case there should be a delay in the execution of the license agreement, it would seem wise to tell Standard that we are not yet in a position to come to a decision in view of pending license agreements with other companies" (exhibit 58).

In the event that this delay should not prove sufficient to stop Standard Oil, I. G. Farben conjured up still another barrier. Even after Hercules signed the agreement and got its nonexclusive license, "Dr. ter Meer feels that business fairness demands that we advise Hercules about our plans in regard to Standard and continue conversations with Standard only provided that Hercules raises no serious objections" (exhibit 58). The sudden interest in "business fairness" is explained by the fact that "Dr. ter Meer feels that Hercules will object" and thus prove to be the means of stalling Standard. Thus was the full acquiescence of Hercules Powder twisted and tortured to make it appear to be an insuperable wall of relentless opposition.

I. G. Farben then proceeded to fortify the potential "objections" of Hercules with equally imaginary opposition from du Pont and Union Carbide. The letter to Hochschwender explained that du Pont had been asked if they were interested in I. G. Farben's anhydride process rights even before they were offered to Hercules Powder, but "after a relatively superficial examination, du Pont answered this question in the negative and said that they had no objection to I. G. licensing its patents in the United States" (exhibit 58).

Obviously I. G. Farben would never have offered them to Hercules unless that rejection by du Pont had been final and unqualified. But that did not stop I. G. Farben from continuing to use the situation against Standard Oil, as indicated by their next statement in the letter to Hochschwender:

"In case Hercules should not object, Dr. ter Meer thinks that another conference with du Pont should be held. Ter Meer feels that when du Pont said that they had no objection to our granting licenses to third parties in the field of acetylcellulose and acetic acid anhydride, du Pont did not have in mind that we would grant licenses not only to one but to several companies which had not theretofore been active in this field" (exhibit 58).

The extremes to which I. G. Farben was willing to go is illustrated by its reasoning as to why Union Carbide should be deemed as preventing the issuance of a license to Standard Oil. They wrote Hochschwender that "although we have no agreements with U. C. C. concerning acetic acid anhydride, U. C. C.

Digitized by Google

dominates the market at the moment and would probably regard it as very disagreeable if we enabled another customer of theirs to manufacture acetic acid anhydride itself" (exhibit 58).

After exhausting its supply of fictitious excuses for not giving its American partners a license, I. G. Farben concludes its letter to Hochschwender with an appropriately hypocritical assurance that "while we are no doubt interested in successful operation of the arc process developed in Jasco and while we should like to make it possible for Standard to exploit the pilot plant, we feel, nevertheless, that in view of the considerations mentioned above, reserve is necessary for the time being in regard to acetic acid anhydride" (exhibit 58).

This intricate planning and plotting reveals how adroitly I. G. Farben has used its many international ties and friendships to stymie American business, making it appear all the while that other American firms were at fault.

Subsequent events proved conclusively that none of the American companies were opposed to a Standard Oil license. In accordance with the procedure suggested in I. G. Farben's letter to Hochschwender, Hercules was informed that "Standard intends to sell acetic anhydride to other producers of cellulose acetate" and not merely to it alone (exhibit 59). But the reaction was not the one sought by I. G. Farben. Hercules not only failed to protest, but went further and asserted that they were "very much interested in working out any arrangement whereby we could feel that we were getting our acetic anhydride at a price which was no greater than that paid by our competitors for acetic anhydride of equal strength" (exhibit 69).

Unable to stimulate opposition among American companies, I. G. Farben finally gave Standard Oil formal notice that it was "prepared to grant a license to Standard under I. G.'s patents covering the production of acetic anhydride as described in U. S. P. 1,865,405, and to give any technical information they have in this field which may be useful for you" (exhibit 61).

This victory for Standard Oil, coming 5½ months after the original request, was more apparent than real. The letter of notification, which came from Chemnyco, concluded with a strong hint of indefinite postponement before Standard Oil could get under way:

"We are of course aware that, at this time, nothing definite can be arranged with Hercules Powder or any other possible customer, since the question of production costs of acetic anhydride has not sufficiently been cleared up. We have asked the I. G. some time ago to send us a detailed description of the process, including all figures that are necessary for a preliminary calculation, and shall forward it to you as soon as received" (exhibit 61).

These long delays plus the shut-down of the acetylene plant at Baton Rouge were apparently sufficient to crush Standard Oil's efforts to get into the anhydride field. The fact is that Standard Oil never did make acetic anhydride.

The question of anhydride manufacture by Standard Oil at Baton Rouge came up a year later, in June 1937, when du Pont was entertaining such an arrangement. The protracted and indeterminate idleness of the acetylene plant was sufficient to kill this project in its early stages. A Standard Oil official wrote on June 7, 1937, that "in view of the uncertainty regarding the future of the 'E' (acetylene) plant at Baton Rouge, we have not looked into this anhydride question further" (exhibit 62).

These case studies of the operations of an international business partnership with the American member as junior partner, show clearly that the United States always loses more than it gains from such an arrangement. I. G. Farben used its American patents to improve its world position, not to establish new industry in this country. Standard Oil was treated by it as a mere tool rather than as a partner, and this country suffered as a result because it prevented the natural expansion of that company's activities in the chemical field. The record shows that as a rule, Standard Oil was aware of the policies being pursued by I. G. Farben, and was willing to go along with it.

I. G. FARBEN WAS THE NAZI GOVERNMENT'S PROXY IN INTERNATIONAL TRADE

Judged from the viewpoint of business relations alone, such ties between American and foreign business interests are dangerous enough. When they reach over into the realm of government policy, they become even more menacing. In the case of I. G. Farben, it necessarily began to reflect German Government policy and strategy as soon as Hitler became the effective dictator of that country.

Standard Oil was amply warned of these developments as early as January 1934. At that time, during a conference in Germany, Standard Oil officials

Digitized by Google

were told that, with respect to the manufacture of acetylene products at Baton Rouge, there were two obstacles: (1) The departments of I. G. Farben producing those chemicals would have to be given full consideration, and (2) "another complication is the present policy of the German Government in requiring examination and approval of foreign contracts" (exhibit 63). This reference to the German Government's direct participation in all of I. G. Farben's foreign activities should have put Standard Oil on notice that its dealings with its German partner from then on would go far beyond the scope of private business. Thenceforth I. G. Farben decisions should have been regarded as German Government decisions, and since this was 1934 that meant Nazi decisions.

During periods of war and war preparedness, international business agreements of this type can be extremely harmful, if, as is the case here, one party operates as a direct agent of Government policy, while the other is actuated primarily by ordinary business incentives. This is especially true when the nations represented by the partners are potential enemies. That was the situation when war broke out in September 1939, and during the years immediately preceding. During that whole period Hitler was patently girding his nation for war and making it more and more obvious that a clash between his Germany and this country was inevitable. The I. G. Farben-Standard Oil partnership continued to operate through the years as though the situation since 1930 had remained substantially the same. From 1934 until 1941 Standard Oil had been able to do business with Hitler.

Upon formal declaration of war, the two partners did make some adjustments in their joint enterprises. In the chemical field, they had joint interests in a host of patents throughout the world and in the Jasco plants at Baton Rouge. They first settled the problem of the Baton Rouge plant.

Chemnyco cabled I. G. Farben on September 6, 1939, that Standard Oil and it had agreed to a plan whereby both partners would surrender to Jasco their notes against the plants and "authorize dismantling the plants for salvage" (exhibit 64). I. G. Farben approved the proposal by reply cable of September 9, 1939, authorizing Chemnyco to proceed with the transaction. Accordingly, on September 15, both Standard Oil and Chemnyco wrote to Jasco, in substantially the same language that "you have heretofore advised us that the 'D' and 'E' plants at Baton Rouge, Louisiana, are of no further use to your Company and should be abandoned as of August 31, 1939. We have discussed this question with I. G. Farbenindustrie and we and they agree that said Plants should be abandoned under the circumstances" (exhibit 65).

Jasco reported on November 22, 1939, to its two owners that the plan outlined in the letters of September 15 had been carried out. With respect to the dismantling, Jasco reported that the plan was that "Jasco would make the best deal that it could in connection with the dismantling of the 'D' and 'E' plants at Baton Rouge, Louisiana. This has been done and Jasco has received payment in the sum of $100,000 for its interest in the dismantled plants" (exhibit 66). There are numerous features of this unusual transaction which merit further scrutiny. Obviously, I. G. Farben and Standard Oil had to settle accounts for but one reason, the likelihood that the United States would be drawn into the war against Germany. In view of the fact that as early as 1934 the German Government was a direct participant in I. G. Farben's dealings with Standard Oil, there is no doubt that in this transaction, with Germany already at war, I. G. Farben reflected Nazi policy. Standard Oil, on its side, acted as a strictly private business corporation.

The plan of procedure was apparently settled in a few days' time. Considering the importance of acetylene to any war production program, it seems strange that so drastic a step as dismantling was decided upon without making certain that the plant could not be put to use. It is significant that Jasco was ordered to dismantle and not to make the best possible disposition of the facilities. In view of the fact that Standard Oil's own subsidiary, Standard Oil of Louisiana, was to buy the acetylene plant, the insistence on dismantling in the original plan is extremely disturbing. Under those circumstances, there could not have been any financial reason for so extreme a move.

Dismantling of the acetylene plant was of no special advantage to Standard Oil. But the German Government, through I. G. Farben, was undoubtedly anxious to facilitate the destruction of any plant in the United States which might be useful in war production. Such disposition of these, the only physical assets of Jasco, also brought the Germans some badly needed dollar exchange.

It is true that back in May of 1939 Standard Oil was already in agreement with I. G. Farben "that it is no longer necessary or desirable to maintain the

Digitized by Google

'E' plant intact, since it is extremely unlikely that it will ever be operated again" and that "it is probably impossible to salvage any appreciable part of the structure" (exhibit 67). Undoubtedly, the 4 years of idleness had resulted in some deterioration. In that connection, however, it is significant that on May 23, 1939, Standard Oil reported that I. G. Farben was "looking at the depreciation and maintenance expense" of the acetylene plant as one way of "saving all possible expenses which require the use of dollars" (exhibit 67). The plant, therefore, must have been maintained at least up to that time. In any event, no matter what the commercial prospects of the acetylene plant might have been late in 1939, the outbreak of war made it imperative to reappraise the plant with an eye to its possible utility in war production. As far as the records show, Jasco did not make such an appraisal.

Considering the importance of the step being taken, it is particularly surprising that in authorizing the dismantling, both Standard Oil and I. G. Farben stated in their letters of September 15 merely that they agreed the plants should be abandoned "under the circumstances." Nowhere is there an explanation of what circumstances the parties had in mind.

Another interesting feature of this transaction is the fact that though it was inaugurated subsequent to September 1 and was not concluded until December 1, 1939, it was effective as of August 31, 1939, the day before war was declared.

Whatever the ultimate judgment on this transaction may be, there can be no gainsaying the fact that Jasco was at that time as much under I. G. Farben's domination as it had been in prior years. Also, the letters of September 15 show on their face that abandonment of the plant was suggested by Jasco and agreed to by the partners. There is also no denying the fact that acetylene shortages developed in 1940 and 1941, requiring Niacet to actually curtail its acetic acid production at a time when demand was rapidly growing.

SHELL OIL INTERESTS OFFERED TO HELP GERMANY EVADE BLOCKADE

How the national welfare is endangered when international corporations continue to pursue their private business objectives in world markets during wartime is also illustrated by the activities of Dutch Shell interests. Their American chemical subsidiary, the Shell Chemical Co., obtained a license from I. G. Farben in August 1939 under United States patents covering the production of acetic, propionic, and formic acids by a process materially different from that used at Baton Rouge by Jasco. As was brought out earlier, the Shell people had considerable difficulty in getting this license because I. G. Farben insisted on prohibiting all exports of these chemicals from the United States not only by Shell but also by its customers.

Shell's final capitulation to I. G. Farben did not end their interest in exports. Being primarily an international corporation, Shell was obviously as anxious to engage in export trade as I. G. Farben, being also an international corporation, was anxious to prevent such activity. On September 15, 1939, while the Netherlands were still neutral in the war, Shell offered to supply acids to I. G. Farben's foreign customers. Chemnyco relayed Shell's offer to Germany, stating that Shell "suggests that if under prevailing conditions you are prevented from delivering formic acetic and propionic acid to certain foreign countries you give Shell Development temporary permission to sell these acids from the production of the pilot plant which Shell is erecting in California. Shell is aware that according to the license agreement they are not allowed to export the acids from the United States, but they believe that it might be in the interest of both parties if they would make deliveries to customers whom you cannot supply. Shell is especially interested in selling formic acid to the Dutch East Indies. Shell is prepared to have sales made through your representatives and to discontinue such exports as soon as you so desire. Please cable whether and to what extent you are prepared to comply with Shell's request. If you agree with the above, Shell will erect a larger pilot plant than originally contemplated" (exhibit 68).

I. G. Farben rejected the proposal on September 29, 1939, apparently feeling confident that British blockades would be ineffective (exhibit 69).

The rejection of its offer did not discourage Shell. On October 2, 1939, in reply to the notice of refusal, Shell wrote to Chemnyco that "we are still much convinced about the desirability of export of the acids under the present circumstances, and that, therefore, we should appreciate it if I. G. on their side would consider this suggestion again, should any new development put I. G. in a position to do so" (exhibit 70).

Digitized by Google

By February 1940 the Germans recognized that they were going to have considerable difficulty in supplying their foreign customers. Consequently, I. G. Farben reconsidered the Shell proposal and granted them permission to export formic acid on the following conditions:

"(1) no deliveries, either direct or indirect, to be made to Europe;

"(2) all exports to be discontinued at any time upon I. G.'s request;

"(3) that I. G.'s hitherto established prices and terms of delivery are not underbid, but if possible be increased.

"It is to be understood that you will be prepared to make deliveries to I. G.'s representatives in the respective countries but I. G. does not object to your doing business at the same time with other firms. In consideration of the export concessions for formic acid, I. G. believes that for the time this concession is to remain in force, a payment of 2½% in addition to the contractual royalty of 5½% would be justified; this addition, however, to be independent of minimum royalties set forth in the agreement referred to above and to apply only to deliveries to firms other than I. G.'s representatives" (exhibit 71).

Harsh as these terms were, Shell was quick to accept them. Immediately upon receipt of the German conditions, Shell replied that they "were pleased to see that the I. G. appears willing to consent to the export of formic acid under certain conditions" (exhibit 72). The only provision they opposed was the payment of extra royalties on sales made directly instead of through I. G. Farben agents.

By initiating this proposal and then accepting the terms laid down by I. G. Farben, Shell Chemical indicated that it was willing to maintain the foreign trade of I. G. Farben which the British blockade was trying to prevent. Obviously, Shell was actuated entirely by its own narrow business interests and gave no consideration whatever to the fact that it was aiding the German Government in its direct war against Britain and its indirect war against the United States. Apparently the fact that the Shell Chemical Co. was an American corporation and that the British had heavy investments in the parent Dutch Shell organization did not affect the international trade policies of the company.

Regardless of how the ordinary British, American, or Dutch citizen might characterize this deal, it did not involve any technical violation of law. Shell, as an international corporation, was quite naturally and quite legally grabbing every opportunity to expand its foreign trade, letting the political and military chips fall where they may.

Not until Germany actually invaded Dutch Shell's native country in May 1940 did Shell abrogate this agreement with I. G. Farben. On May 13, 1940, the day Queen Wilhelmina had to flee from the Netherlands and only two days before Holland finally capitulated, Shell wrote to Chemnyco that "because of the recent political developments, we are no longer in a position to discuss any arrangement as referred to in your letter of May 9th. We have not yet decided whether or not we shall erect a plant for the production of the acids in question" (exhibit 73).

Thus ended Shell's effort to help maintain Hitler's foreign markets. The question still left unanswered is what would have happened if Shell's country of incorporation happened to be an ally of Hitler or at least not a victim.

CONCLUSIONS

These case studies are not peak or extreme examples of how international corporations make use of United States patents. What I. G. Farben has done in the acetylene field it has undoubtedly repeated in every branch of industry in which it is interested. Also, its methods and policies have most likely been aped by other enemy corporations. On our side, the practices of Standard Oil and Shell are probably representative of the way international corporations in general have cooperated with foreign business interests in their manipulation of American patents. After all, the corporations involved rank very high in the world of business and their policies and practices have a profound influence on the methods of doing business adopted by others. These case studies can therefore be considered to be typical and as such they point to an alarming situation in the patent field the correction of which is essential if maximum war production is to be attained.

Unfortunately it does not seem likely that private business can clean house by itself. First of all there are probably many legal limitations which would

Digitized by Google

prevent them from doing a thorough job. Far more important is the fact that these international corporations seem oblivious of the political and military implications of their world-wide patent pools and understandings with foreign corporations. World trade never was a mere matter of business but the dangers inherent in neglecting its political and military aspects never were as great as they have been in recent years. The mechanization of war and the advent of Hitler with his barter diplomacy have intensified tremendously the need for giving primary attention to these features of foreign trade. I. G. Farben, for example, in recent years was first and foremost an instrumentality of Nazi political and military strategy and only secondarily a business enterprise. But our own international corporations seem to have disregarded these radical developments. Standard Oil knew as early as January 1934 that every foreign business move made by I. G. Farben had to be disclosed first to the Nazi Government and approved by them. That did not affect Standard Oil's performance under the 1929 partnership agreement even though it necessarily curtailed I. G. Farben's performance thereunder.

The attitude of the international corporation seems to be that as long as it is legal and good business, that is in the opinion of corporate management, then it is all right to enter into patent pools and friendly agreements with foreign corporations no matter what the latter's motive might be or how such a deal might affect the welfare of the United States as a political and military power. In defense of this position, businessmen argue that political and military matters are the province of government and that by taking such a view business is merely sticking to its own knitting. They are right in saying that government should deal with the nonbusiness matters, and that means direct government participation in international business. The political and military aspects of this branch of business has gained so much in relative importance during the past decade that the tradtional machinery for coping with this problem has been woefully inadequate.

With specific reference to the patent phase of international business, we must make certain that patents can no longer be used by foreign interests and their American friends as legal devices to attain illegal ends. Remedial machinery and legislation must be provided so that what I. G. Farben did in the acetylene field will not be repeated in the future. The Alien Property Custodian should be given all the legislative and other governmental assistance needed in order to go beyond "surface appearances," as Mr. Crowley put it, in determining who controls the utilization of certain patents. In modernizing the patent controls, it should be fully recognized that international patent pools, and even individual patent holdings, have been used extensively as a means of legally evading the antitrust laws. Merely preventing the doing of the wrong thing will not assure us of the maximum benefits which can be derived from these foreign held or controlled patents. Government must take affirmative steps to see that the processes covered by the patents are developed and utilized wherever it is advantageous to do so. If private business hesitates to take these positive measures, then, as Mr. Crowley suggests, Government must move in that direction.

Government must act with speed and thoroughness if it is to end the era when United States patents could be used by foreign interests to enhance their own international position, hinder production here, evade the antitrust laws, keep American producers out of export markets, thwart American research, get the benefits of our discoveries without fully reciprocating, and, finally, obstruct our war-production program. By recognizing that world trade, including international patent pools, are matters of public concerns, not plain, ordinary private business, the patent system of this country can be made to operate more effectively in the public interest than it has in recent years.

EXHIBIT No. 134

ZINC

Statement by Allen Dobey

At the present time this country is faced with a serious shortage of high-grade zinc. Long ago civilian consumption of high-grade zinc was drastically curtailed. Further curtailment is in store. War Production Board officials believe that there will be enough high-grade zinc for military purposes during 1942. The possibility of a more acute shortage in 1943 and beyond can only be eliminated by rapid expansion of our present facilities for the production of this vital commodity.

Digitized by Google

It is our purpose here to inquire into the possible causes for this shortage and to suggest remedial measures within the jurisdiction of this committee.

Zinc metal is of varying grades, depending primarily on the process of smelting or refiining employed and measured by the extent of the impurities remaining in the zinc metal. The purer the zinc metal, the greater is its malleability, ductility, and durability.

The different grades of zinc metal are special high grade, high grade, intermediate, brass special, and prime western. Special high-grade zinc is zinc metal at least 99.99 percent pure. High-grade zinc is metal at least 99.9 percent pure. Intermediate zinc is metal at least 99.5 percent pure. Brass special zinc is metal at least 99 percent pure, and prime western zinc is metal at least 98.4 percent pure. Prime western zinc is frequently referred to as common metal.

High-grade zinc (including special high grade) is used principally for die casting from zinc-base alloy and in the manufacture of brass. There is also a growing use of high-grade zinc for galvanizing.

High-grade zinc is a vital war material. Its principal military uses are in shell casings, small-arms ammunition, and die-casting parts for tanks and airplanes.

We believe that the documents we are presenting to this committee in connection with this presentation will show the following:

(1) The New Jersey Zinc Co., a New Jersey corporation, with its principal offices in New York City (hereinafter referred to as New Jersey) by means of patent controls has restricted and is restricting the production of high-grade zinc in this country.

(2) New Jersey has continually and over a long period of years pursued a policy of limiting the production of high-grade zinc in this country for the purpose of stabilizing the domestic market.

(3) New Jersey has prohibited its principal licensee in this conutry, the E. I. du Pont de Nemours & Co., from producing high-grade zinc and has required such licensee to sell one-half of the zinc produced by the licensed process as brass special or prime western zinc notwithstanding the fact that the zinc produced was actually of intermediate grade. As an alternative the licensee was required to debase the metal.

(4) New Jersey's patent licensing policy has been and is delaying the construction of additional high-grade zinc refining capacity in this country.

(5) New Jersey has discouraged the production of additional high-grade zinc by interested parties in order to preserve New Jersey's present position in the high-grade zinc industry after the war.

(6) Under the guise of patent controls New Jersey has erected its own private trade barriers throughout the world whereby New Jersey has agreed not to export high-grade zinc to the territories of its foreign licensees and New Jersey's foreign licencees have agreed not to export high-grade zinc produced by New Jersey processes to the United States or to the territories of other New Jersey licensees.

(7) While refusing to license the production of high-grade zinc in this country, New Jersey, in order to obtain the maximum revenue from royalties, has encouraged unlimited production of high-grade zinc by New Jersey processes in foreign countries, including Germany. As a result New Jersey has made a vital and substantial contribution to the German war machine.

It should be pointed out that we believe that most (but not all) of the policies which New Jersey has pursued for the purpose of restricting the production and sale of high-grade zinc in this country have been within New Jersey's legal rights. At the present time no antitrust action is under consideration or contemplated. We believe that the situation disclosed by the documents we are producing can only be remedied by legislation providing for compulsory licensing of United States patents owned by United States companies.

PROCESSES FOR REFINING ZINC

The oldest method still in use for the smelting or refining of zinc is the horizontal retort process. For many years this was the only pyrometallurgical method of smelting zinc. In this process the zinc ore concentrates are placed in horizontal retorts and subjected to distillation by heat, the zinc passing off in the form of vapor which upon cooling condenses into the zinc metal. This process produces zinc of a prime western grade unless subjected to special treatment, or redistillation. The horizontal retort process is not practicably or economically suitable for the production of high-grade zinc.

Digitized by Google

About 1928, New Jersey developed the "vertical retort" process for the production of high-grade zinc or near high-grade zinc. Shortly thereafter, patents on this process and apparatus appurtenant thereto were issued by the United States Patent Office to inventors employed by New Jersey and assigned by them to the company.

The vertical retort process, like the horizontal retort process, is a method of producing zinc metal by pyrometallurgy. This process has definite advantages over the horizontal retort process because of its capacity to refine high-grade zinc and also because of its capacity to refine larger quantities of zinc at less cost. The vertical retort process is sometimes referred to as the "continuous retort" process by reason of the fact that the process may be operated continuously, unlike the horizontal retort process whereby the zinc metal is smelted in batches.

About 1933 New Jersey developed the "fractionation" process for the refining of zinc metal of the highest grade. Zinc metal refined by this process averages 99.995 percent pure zinc. In 1935 patents on this process and apparatus appurtenant thereto were issued by the United States Patent Office to inventors employed by New Jersey and assigned by them to the company.

The fractionation process is a purification or rectification process as distinguished from a smelting process and is similar to the process used in the rectification of alcohol and the separation and cracking of petroleum. It is a supplemental process for the refining of zinc which has already been smelted and operates to purify zinc metal.

The invention is broadly characterized by subjecting the metal to be purified in vapor form to counter-current and intimate contact with refluxing molten metal formed by condensation of the vapor.

From the above it will be noted that the United States patents relating to both the vertical retort process and the fractionation process are owned by New Jersey. New Jersey has also obtained patents on these processes in the following foreign countries: Canada, Newfoundland, Mexico, Great Britain, Germany, France, French Morocco, Tunis, Spain, Norway, Poland, Czechoslovakia, Belgium, Belgian Congo, Holland, Luxemburg, Sweden, and Italy.

Aside from the vertical-retort process and the fractionation process, the only other process in general use for the production of high-grade zinc is the electrolytic process.[1] Under this method of refining the zinc ore concentrates are dissolved and the zinc is separated from the other elements in the solution by the action of electric current. The basic patents on this process have expired.

At the present time there are only four plants equipped with the electrolytic process in operation in the United States: The Anaconda Copper Mining Co. has plants at Great Falls, Mont., and Anaconda, Mont.; the Sullivan Mining Co. has a plant at Kellogg, Idaho; and the American Zinc Lead & Smelting Co. has a plant at East St. Louis, Ill., which was purchased from the Evans-Wallower Zinc Co. in September 1940.

Unlike the vertical-retort process or the fractionation process, the operation of the electrolytic process requires an abundance of hydroelectric power. The fractionation process can be used either with horizontal or vertical retorts for the refining of zinc metal of the highest grade, but the use of the electrolytic process requires the erection of a plant specially equipped for this purpose. The construction of an electrolytic-process plant consumes a longer period than that required for the construction and equipment of any other type of plant suitable for the production of high-grade zinc. The initial cost of the construction of an electrolytic-process plant is much greater than the initial cost of the construction of either a vertical-retort plant or a horizontal-retort plant equipped with fractionation.

DOMESTIC LICENSES OF NEW JERSEY

New Jersey has persistently refused to issue licenses in this country for the production of high-grade zinc under either the fractionation process or the vertical-retort process patents. Nevertheless, as will be noted more fully hereinafter, New Jersey has issued licenses freely under its foreign fractionation process and vertical-retort process patents, including licenses to German and Italian concerns for unlimited production.

[1] The St. Joseph Lead Co. has produced a very limited quantity of high-grade zinc by an electrothermic process.

Digitized by Google

The American Smelting & Refining Co. is New Jersey's only domestic licensee under the fractionation-process patents. This license limits production to a maximum output of 5,000 tons of high-grade zinc per year and arose out of unusual circumstances.

In 1934 inventors employed by New Jersey and inventors employed by the American Smelting & Refining Co., had interferences pending in the United States Patent Office in connection with applications for patents on the fractionation process. The applications filed by the inventors for New Jersey related to the fractionation process as applied to the purification of zinc metal only. One of the applications filed by the inventors of the American Smelting & Refining Co. related to the fractionation process as applied to the purification of metals generally. As a result of this interference, New Jersey and the American Smelting & Refining Co. arrived at a settlement agreement dated June 27, 1934 (exhibit 1) pursuant to which the American Smelting & Refining Co.'s inventors ceded priority in the interference to the inventors of New Jersey and pursuant to which New Jersey's inventors filed a new broad application relating to the fractionation process as applied to metals generally. Thereupon the applications of New Jersey's inventors, including the new broad application, were allowed on March 12, 1935, and the patents were assigned to New Jersey. In accordance with and pursuant to the settlement agreement of June 27, 1934, New Jersey then granted the American Smelting & Refining Co. an exclusive license to use the fractionation process for the purification of all metals other than zinc. As a further part of this settlement, the American Smelting & Refining Co. was given an additional license under the fractionation process patents which authorized the licensee to use the fractionation process for the refining of not more than 5,000 tons of slab zinc metal per year. The license further provided that the zinc metal refined by the fractionation process was to be sold only to Revere Copper & Brass, Inc., and the General Cable Corporation (both companies are subsidiaries of the American Smelting & Refining Co.), and the metal so produced and sold was to be used only by the purchasers in their own manufacturing operations. It was also provided that in the event the purchasers did not require the entire licensed output (5,000 tons per year) of the American Smelting & Refining Co., the balance of the high-grade zinc should be sold to New Jersey, if it so wished, or to a purchaser designated by New Jersey, at a price less than the metal would command in the open market.

It was further provided that in case the purchases by Revere Copper & Brass, Inc., and the General Cable Corporation did not consume the entire licensed output of American Smelting & Refining Co., the American Smelting & Refining Co. should have the option of selling the balance of the licensed output for export to any country in which at the time of export New Jersey had not granted a license under its foreign fractionation process patents. American Smelting & Refining Co. agreed to mark the zinc metal refined by the fractionation process as required by New Jersey in order to assist New Jersey in identifying the origin of the zinc metal and excluding it from entry into countries in which at the time of export New Jersey had licensed some one else under its foreign fractionation process patents.

It was futher provided in the license agreement that the American Smelting & Refining Co. should have the option to refine part or all of the 5,000 tons of high-grade zinc in Mexico instead of in the United States, in which event, however, the zinc was not to be exported to the United States or to any country in which at the time of export New Jersey had granted a license to another under its foreign fractionation process patents.

Thus the zinc license granted by New Jersey to American Smelting & Refining Co. under the fractionation process patents was circumscribed and limited in minute detail, so much so that it seems desirable for the sake of clarity to repeat the restrictions upon the licensee by quoting directly from the license from New Jersey to American Smelting & Refining Co. granted pursuant to the settlement agreement of June 27, 1934. I quote:

"The Zinc Company * * * hereby gives and grants to the A. S. & R. Company a nonexclusive license * * * for the purpose only of distilling or redistilling and refining or purifying in the United States not more than five thousand (5,000) tons of zinc in any one calendar year, the said five thousand (5,000) tons to constitute the maximum licensed output of the A. S. & R. Company in any calendar year, the said zinc to be sold only to Revere Copper and Brass, Inc., and/or General Cable Corporation, their successors or assigns, for use only by said pur-

Digitized by Google

chasers in their own manufacturing operations, provided, that in the event the purchases by the said purchasers do not require the entire licensed output of the A. S. & R. Company under this agreement, the balance of high-grade zinc so produced shall at the option of the Zinc Company be sold to the Zinc Company or to a purchaser designated by the Zinc Company at a price computed according to the following formula * * *. If within thirty days from the receipt by the Zinc Company of the notice from the A. S. & R. Company of the balance of zinc metal remaining on hand and available under the provisions of this clause, the Zinc Company shall not give the A. S. & R. Company disposal instructions for such balance of metal on hand, then the A. S. & R. Company shall have the right to sell such balance on the open market as it sees fit. The A. S. & R. Company shall have the option, in case the purchases by Revere Copper and Brass, Inc., and General Cable Corporation do not require the entire licensed production of the A. S. & R. Company under this agreement, of selling such balance for export to any country not included in the prohibited territtory referred to in clause 7 hereof."

Parenthetically it may be noted that clause 7 describes prohibited territory as any foreign territory in which New Jersey has granted a license to another under its foreign fractionation process patents.

Upon the execution of the settlement agreement of June 27, 1934, the American Smelting & Refining Co. proceeded to construct a fractionation process plant for the refining of high-grade zinc at Amarillo, Tex.

On September 12, 1940, New Jersey agreed to permit American Smelting & Refining Co. to produce not to exceed 6,000 tons of high-grade zinc for the current year 1940 and on April 14, 1941, New Jersey agreed to permit American Smelting & Refining Co. to produce not to exceed 7,000 tons of high-grade zinc for 1941. I quote from the correspondence in this connection (exhibit 2):

AMERICAN SMELTING AND REFINING COMPANY,
120 Broadway, New York, September 13, 1940.

Mr. M. L. HAVEY,
Vice President, the New Jersey Zinc Company,
160 Front Street, New York, N. Y.

DEAR MR. HAVEY: We acknowledge with thanks your letter of the 12th instant consenting to waive for the calendar year 1940 the limitation on our production of refined zinc under license agreement dated June 27, 1934, and we accept the conditions to which you refer, namely, that such production shall not exceed 6,000 tons during said year and that such waiver shall not constitute a precedent.

Your compliance with our request is greatly appreciated.

Very truly yours,
SHL.J S. H. LEVISON.

[Copy]

Office of the Vice President.

THE NEW JERSEY ZINC COMPANY,
160 Front Street, New York, April 14, 1941.

AMERICAN SMELTING AND REFINING COMPANY,
120 Broadway, New York, N. Y.
(Attention Mr. S. H. Levison, General Manager, Zinc Department.)

GENTLEMEN: Mr. Levison requested on the 10th instant that we waive for the calendar year 1941 the limitation on your production of refined zinc under license agreement dated June 27, 1934, so that your plant may be continued in full operation for the balance of this year. Mr. Levison estimated that total production for 1941 would not exceed 7,000 tons.

Under the existing conditions we are willing to and do hereby waive the said restriction on production for the calendar year 1941, with the limitation, however, that such production shall not exceed 7,000 tons and also that this waiver shall not be deemed to constitute a precedent for any further waiver in the future.

Will you please let us have your acknowledgment and acceptance of these conditions?

Very truly yours,

[Sgd.] M. L. HAVEY, *Vice President.*

AMERICAN SMELTING AND REFINING COMPANY,
120 Broadway, New York, April 15th, 1941.

THE NEW JERSEY ZINC COMPANY,
160 Front Street, New York, N. Y.
(Attention Mr. M. L. Havey, Vice President.)

GENTLEMEN: This will acknowledge your letter of April 14, 1941 in which you waive the restriction in our agreement of June 27, 1934 to the extent that we can produce up to 7,000 tons of refined zinc during the current year.

We agree, of course, that the production will not exceed the 7,000-ton figure during 1941 and recognize that your action is not to be deemed to constitute a precedent for any future waiver.

Very truly yours,

S. H. LEVISON.

SHL:S

B/C—L. K. Lacey, H. Y. Walker, K. C. Brownell, W. R. Boyle, E. J. Bruderlin, C. J. Roberts.

These waivers, of course, were subject to the original restrictions of the 1934 license upon the disposition of the zinc, that is, the metal was to be sold only to subsidiaries of the American Smelting & Refining Co. for use by such subsidiaries only in their own manufacturing operations, etc.

On September 23, 1940, the American Smelting & Refining Co. endeavored to procure a license from New Jersey under New Jersey's United States fractionation process patents for the construction of a high grade zinc refining unit at Beckemeyer, Ill. The American Smelting & Refining Co.'s request for the license was made by Mr. E. L. Newhouse, Jr., a vice president of the American Smelting & Refining Co. in charge of the federated metals division of the American Smelting & Refining Co. Mr. Newhouse's request is reported in an interoffice memorandum written by Mr. C. H. George, head of the patents division of New Jersey, dated September 23, 1940. I quote from Mr. George's memorandum (exhibit 3):

MEMORANDUM

SEPTEMBER 23, 1940.

Mr. E. L. Newhouse, Jr., President of Federated Metals Division of American Smelting and Refining Co., 120 Broadway, New York City, came in to see Mr. Hayes this morning. Mr. Hayes called me to his office and told me that Mr. Newhouse desired to have a license under our zinc refining processes; he asked me to discuss the matter with Mr. Newhouse in order to obtain the information necessary for us to determine whether there are any limitations in our previous commitments on the granting of such a license and to study the probable effect on our business if such license should be granted.

Mr. Newhouse told me that their plant at Beckemeyer, Illinois (in the St. Louis industrial district), is producing about 800 tons per month of Prime Western grade metal from drosses, skimmings, and other residues. He would like to have a license to build a refining plant of about the same capacity as the one at Amarillo—namely, about 5,000 tons per year. He wants to produce High Purity zinc, to be used in the manufacture of die-casting alloys of Zamak type, which Federated produces under license from us. At the present time their High Purity zinc is purchased from us (about 1,200 tons per year), the Anaconda Company, and St. Joseph Lead Company.

I asked Mr. Newhouse whether the production contemplated would supply their requirements of High Purity zinc for the production of these alloys, but he did not give a definite answer, claiming that he did not know and that furthermore it was impracticable to predict the future market for these alloys in view of the ever-increasing demand.

I asked Mr. Newhouse also whether his request was limited to a license for one unit of about 5,000 tons per year, or whether he contemplated eventlly refining the entire production of his Beckemeyer plant, which amounts to nearly 10,000 tons per year. He was not conclusive about this matter either, saying that at the moment his plans did not extend beyond one unit.

Digitized by Google

On September 24, 1940, New Jersey refused to grant the American Smelting & Refining Co. a license under the fractionation-process patents, as appears from an interoffice memorandum of that date written by Mr. George, head of New Jersey's patents division. I quote (exhibit 4):

MEMORANDUM

SEPTEMBER 24, 1940.

Mr. Havey and I called on Mr. Newhouse this afternoon and explained our position relative to his request yesterday for a license for a refining unit at his Beckemeyer, Illinois, plant. I told Mr. Newhouse that we had given his request our careful consideration and that it seemed certain to us that if we should grant his Company a license, we should receive requests promptly from other common metal producers for similar licenses, which we would find it difficult to refuse. I said we could not believe it would be to the interest of the Zinc Company to make these refining processes generally available to the industry at this time. I pointed out that over several years we have been besought by the common metal producers for such licenses—particularly following the news of the Amarillo plant, which exception, however, we were able to explain as surrounded by special circumstances; that our refusals have been accepted merely as being based on existing policy, so it seems certain that the news of a refining plant at Beckemeyer would be taken as indicating a change in our policy and that we should have to expect that requests for licenses to others would come along promptly. I explained to Mr. Newhouse that it was only with the greatest reluctance that we had come to a decision that precluded our complying with a request from him or his Company, but that we had not been able to reach any other conclusion.

Mr. Newhouse said he could easily understand our viewpoint. He proceeded to explore what seemed to him to be other possibilities. For instance, he asked whether we might not consider a refining unit at Beckemeyer as part of the arrangement for Amarillo, but I replied that our position had been too closely defined to permit of our making such an interpretation. A little later he proposed that we permit the AS&R Company to refine more metal at the Amarillo unit, but I said this also would entail the granting of a license on new terms, something which we were not in position to do. Some mention was made of the production of metal for export under draw-back, and Mr. Newhouse inquired whether that principle could be invoked for his benefit at Beckemeyer. Our answer was No, that in addition to violation of our policy against the granting of licenses in this country we would be in trouble with respect to our foreign-license agreements.

Mr. Newhouse asked whether, in vew of the present situation, we didn't think it might be patriotic on our part to grant licenses so as to facilitate the production of High Grade zinc. My reply was to the effect that, so far as I understood the situation, the greatest difficulty was in the production of common metal; that if the supply of common metal eased, with continuing shortage of High Grade, we had no reason to believe that we would not be able to supply the necessary facilities for the refining of sufficient common metal to supply the demand for High Grade.

Mr. Newhouse and Mr. Havey engaged in some general conversation in regard to the market situation, in the course of which Mr. Newhouse suggested that perhaps, not being able to get a license from us, they might be entitled to some extra consideration n allowance of metal supply for next year, their present contract calling for about 1,200 tons per year, all of which he said they take. Mr. Havey explained our policy on the allotment of metal and was careful to make no commitment as to any extra allowance for next year.

In the close of the conversation Mr. Newhouse thanked us for explaining our position so fully to him and said he was familiar with our policy of granting equal treatment to all; he asked that we inform him of any change in our licensing policy.

CHG.JH

The American Smelting & Refining Co. has recently proceeded with the construction of an electrolytic plant for the production of high-grade zinc at Corpus Christi, Tex. This plant is not yet in operation. From an interoffice memorandum dated February 21, 1941, written by R. F. Goodwin, of the American Smelting & Refining Co., to H. Y. Walker, vice president of the American Smelting & Refining Co., it appears that the production of additional high-grade zinc would

Digitized by Google

have been greatly facilitated if the American Smelting & Refining Co. had been able to obtain a satisfactory license under New Jersey's fractionation process patents. I quote from this memorandum (exhibit 5):

FEBRUARY 21ST, 1941.

Memorandum to Mr. H. Y. WALKER,
Building:

Late yesterday afternoon, Mr. John Church, Chairman of the Non-Ferrous Metals Priority Committee of the O. P. M., called me by telephone from Washington. According to the telephone operator, he originally asked for Mr. K. C. Brownell, and, as Mr. Brownell was not in his office, the call was put on Mr. Boyle's line. When Mr. Church told Mr. Boyle that he wanted to talk about Buchans' zinc concentrates, the latter had the call switched to me.

Mr. Church, over the 'phone, said that he wanted to talk to me about our proposed new zinc plant, saying that it was his understanding that the reason that an electrolytic zinc plant was contemplated was that Buchans' concentrates were not particularly suitable for a retort plant, but that if he were wrong, and they were suitable for such a plant, then, in the interest of saving time in construction, he thought the new plant should be a retort plant equipped with fractionation.

I told him that he was talking to the wrong party, and that he should talk to you, in view of the fact that this new zinc plant was being handled by your department.

Mr. Church repeated to you the substance of his conversation with me, and your rely was to the effect that Buchans' concentrates were suitable for retort smelting, and that a retort plant with fractionation could probably be completed at a saving of 60 to 90 days, as compared to the time required for the construction of an electrolytic plant. You pointed out, however, that a license from the New Jersey Zinc Company would be required for a fractionation plant. Mr. Church then said you already have a license for such a plant at Amarillo, and you replied that this was good only for 5,000 tons of zinc per annum, or a little over 400 tons per month. Mr. Church then suggested that New Jersey Zinc would probably give a license for the 2,000-ton monthly capacity contemplated for the electrolytic plant, but you pointed out that we had had some negotiations with New Jersey Zinc some time ago for a license to cover a substantial monthly tonnage, but that it developed in view of licenses already granted in Great Britain and on the Continent, that there would be no place left to sell the zinc, except in a few unimportant countries of the world.

For this reason, the previous negotiations were dropped, and Mr. Church then said he understood that obviously such a license, if granted now for the tonnage under consideration, would be of no particular use after the present emergency was over.

The entire conversation was of a friendly and understanding nature, and Mr. Church did not imply that he would insist on a retort fractionation plant to cover the present emergency, regardless of the effect of the license complications on the future outcome of the plant.

He ended the conversation by stating that he now understood the situation, and implied that under all the circumstances an electrolytic plant would be desirable.

R. F. GOODWIN.

The American Smelting & Refining Co., with its limited license to produce 5,000 tons of high-grade zinc per year, is the only domestic licensee of New Jersey under the fractionation process patents. New Jersey has issued two licenses in this country under its vertical retort process patents.

On October 1, 1929, New Jersey, in consideration of stipulated royalties and other fees, licensed the Grasselli Chemical Co. under the vertical retort process patents, with the restriction that the licensee was to produce not to exceed 100 tons of slab zinc metal per day, of which not more than 50 tons was to be of intermediate grade and the remainder to be of a grade no better than brass special (exhibit 6). On October 2, 1929, New Jersey and Grasselli amended the license agreement to eliminate the restriction upon the amount of zinc that could be produced by the licensed process but the restriction that one-half of the metal produced was to be of a grade no better than intermediate and the remainder to be of a grade no better than brass special was retained.

The Grasselli Chemical Co. erected a vertical retort plant at Meadowbrook, W. Va. If New Jersey had permitted Grasselli to use New Jersey's patented lead eliminator in connection with the vertical retort process, Grasselli would

Digitized by Google

have been able to produce high-grade zinc at this plant (exhibit 7). Even without the lead eliminator, all of the zinc produced by Grasselli at Meadowbrook by the vertical retort process was approximately 99.7 percent pure, of intermediate grade.

To conform with the license restrictions, it would have been necessary for Grasselli to debase one-half of the zinc metal produced through the addition of lead after the molten metal emerged from the process. In order that the Grasselli Chemical Co. might avoid the expense of thus debasing one-half of the zinc metal, the Grasselli Chemical Co. and New Jersey entered into an agreement on May 20 ,1931, whereby New Jersey agreed that Grasselli was to sell one-half of the zinc produced by the process as intermediate zinc and the remainder produced by the process as brass special or prime western zinc, notwithstanding that all of the zinc was of intermediate grade. I quote from the correspondence on this matter (see exhibit 6):

[Copy]

THE GRASSELLI CHEMICAL COMPANY,
Cleveland, Ohio April 14, 1931.

Mr. F. N. SPENCER,
Vice President, New Jersey Zinc Company,
160 Front Street, New York, N. Y.

DEAR MR. SPENCER: As you know, the Spelter we have been producing at Meadowbrook on your vertical retort furnaces conforms closely to the following analysis:

Iron	.004 to .008
Lead	.10 to .20
Cadmium	.03 to .05

Our license agreement with your good selves provides that not more than one-half of the output may be intermediate grade of the following specification:

Zn	Minimum	99.50
Pb	Maximum	0.20
Fe	"	0.03
Cd	"	0.50
Pb+Fe+Cd	"	0.50
Al	"	0.00

and that the remainder shall be of a grade no better than Brass Special. We, of course, would like to avoid the trouble and expense of debasing any part of the output. On the other hand, we want to live up to the terms of the contract in every particular.

The bulk of our Spelter, as you know, goes to the galvanizing trade, and I do not believe it is competitive with high-grade.

While I do not like to bother you with matters of this kind, yet I shall appreciate it very much if you will kindly let me know whether or not there is any objection on your part to our producing and selling as Prime Western and Brass Special, metal conforming to the analysis mentioned in the first paragraph of this letter which, according to the contract, should be of a grade no better than Brass Special.

Awaiting your reply, and with kindest personal regards, believe me to be

Yours very truly,

[s] E. W. FURST, *Vice President.*

EWF:MC/L

[Copy]

MAY 20, 1931.

E. W. FURST,
Vice President, the Grasselli Chemical Company,
Cleveland, Ohio.

DEAR MR. FURST: Referring to your letter of April 14, 1931, and to conference held here April 22 at which you, Mr. Thompson, Mr. Hayes, and I were present:

We understand that the metal being produced on the vertical retort furnaces at Meadowbrook is all running better than Brass Special, whereas under the

Digitized by Google

terms and conditions of our license agreement, not more than fifty per cent of the output was to be Intermediate Grade. You expressed the desire to sell as Prime Western and Brass Special that proportion of the output which, according to the contract, should be of a grade no better than Brass Special, but which actually comes wtihin Intermediate limits. In other words, all the output now being of Intermediate Grade, you wish to sell one-half of it as Intermediate and the remaining half as Prime Western and Brass Special, even though this latter half analyzes as Intermediate and so is unlicensed under our agreement.

As we explained to you, we are reluctant to do anything which might adversely affect the position of our High Grade Horse Head Zinc, and that is the reason for the restriction in our license to you. On the other hand, we recognize thta conditions in the zinc industry at this time are most difficult, and we are desirous of doing anything we can to aid you in the operation of the new furnaces under these circumstances.

With this purpose and in these circumstances, we hereby waive, temporarily, the requirement in our license agreement that one-half of the output of the vertical retort furnaces shall not be better than Brass Special, as described in Section 4 of said agreement dated October 1, 1929. And we consent to your producing, while the said waiver is in effect, as your entire output, metal no purer than that specified in the analysis given in the first paragraph of your letter of April 14, 1931, on the understanding that you will sell not more than one-half of said metal as Intermediate Grade and the remainder as Prime Western and Brass Special. It is stipulated, however, that such waiver and consent shall be revocable by us at any time on thirty days notice and that in no event shall they extend beyond April 30, 1932, the full terms of the license agreement again becoming of full force and effect thereafter, except, that such revocation or termination of the waiver period shall not be deemed to have the effect of prohibiting the sale or delivery thereafter as Prime Western or Brass Special of metal produced during the waiver period.

Yours very truly,

[s] F. N. S., *Vice President.*

Frank N. Spencer/M.

On October 31, 1936, the Grasselli Chemical Co. assigned its rights under its license from New Jersey to E. I. du Pont de Nemours & Co., and E. I. du Pont de Nemours & Co. assumed all the obligations of Grasselli under the license agreement.

The procedure whereby du Pont, with the consent of New Jersey, sold one-half of the zinc produced at its vertical retort process plant at Meadowbrook as Brass Special or Prime Western zinc, notwithstanding that all of the zinc was of intermediate grade, was continued until some time in 1941, after the investigation in this case had been completed.

On July 9, 1930, New Jersey, in consideration of the transfer to it of a patent owned by the Hegeler Zinc Co., licensed the Hegeler Zinc Co. under the vertical retort process patents, with the restriction that the licensee was not to produce in excess of 50 tons of slab zinc metal per day, said zinc metal to contain not less than 0.5 percent total impurities, of intermediate grade (exhibit 8). By a supplementary agreement of the same date New Jersey licensed Hegeler under its vertical retort process patents to produce 750 tons per month of slab zinc metal to contain not less than 0.2 percent total impurities, of intermediate grade, said metal to be used only in the rolling mill plant of the licensee at Danville, Ill., and none of the metal to be sold as slab zinc but only as rolled metal (exhibit 9).

We have been advised that the Hegeler licenses have never been exercised. In any event, the licenses do not permit the licensee to produce high-grade zinc.

ANACONDA'S APPLICATION FOR A NEW JERSEY LICENSE

In October 1939 the Anaconda Copper Mining Co. requested New Jersey to grant Anaconda a license under New Jersey's fractionation process patents. The circumstances surrounding this request are set forth in a memorandum written by

Digitized by Google

Mr. C. H. George, head of the patents department of New Jersey, dated October 16, 1939. I quote (exhibit 10):

[Copy]

OCTOBER 16, 1939.

Mr. HENRY HARDENBERGH,
Vice President:

Mr. Laist, of the Anaconda Copper Mining Company, telephoned me last week and asked whether we would grant the Anaconda Company a license on our refining processes. He said he is finding it difficult to produce the grade of metal required by his sales department, due to the competition offered by Bunker Hill and ourselves in the die casting field and particularly to the propaganda being spread by Bunker Hill about the extreme purity of their metal. Anaconda's process was not intended, he said, to produce metal with such low leads, and he thought it might be cheaper to refine his product by our method rather than to make the changes or adopt the other expedients necessary to obtain the product required.

With the approval of yourself and Mr. Havey, I called on Mr. Laist this morning to discuss the matter further. He reviewed his position in considerable detail, and from what he said it appears that their product runs just a little under 99.99; he referred to it as 99.99%, or "a scant 99.99." Perhaps it would be a little easier to produce metal 99.97–8, but below that the efficiency of the process runs off. They can get the lead down to .004 at an excess cost of about $4.00 per ton, but beyond that the cost and the difficulties increase rapidly. He thought that to get the lead down to .002 would cost at least another $4.00, and when I asked him about getting down to .001, the figure necessary to equal Bunker Hill, he answered that he did not believe he could get down that low. To get these low leads apparently it is necessary to clean the cells and renew the anodes frequently, the frequence depending on the degree of purity sought. The solutions also must be kept very pure. The anode difficulties can be reduced by employing silver-lead anodes as proposed by Tainton, from whom Anaconda has a license, but while he talked a good bit about the use of such anodes, Mr. Laist did not say that he wanted to use them.

As an alternative Mr. Laist said there was considerable sentiment among his people for selling their product as it is produced normally, with a price differential under that for Special High Grade. He said that the premium of one cent over St. Louis gives them a net of only about $16.00 per ton after allowing for freight, whereas by debasing their metal to Intermediate and selling it on the St. Louis plus basis, they pick up about $7.00 a ton, so that there is a difference of only about $9.00 per ton in favor of the High Grade. He was careful to point out that they had made no decision to take any such action but said he merely wanted to indicate that it had been talked about a great deal among their people.

* * * * * * *

I asked Mr. Laist about the tonnages he has in mind for license, and he said Anaconda is selling from 2,000 to 3,000 tons of Special High Grade per month and that provision should be made also for the metal produced by Anaconda for United States Refining. * * * This would mean from 400 to 500 tons per month for U. S. Refining in addition to the 2,000 to 3,000 tons for Anaconda, or a total of 2,400 to 3,400 tons per month. * * *

* * * * * * *

I told Mr. Laist that we were desirous of rendering assistance to Anaconda in this matter if we could do so without materially injuring our own business. I mentioned that, of course, it would not do our business any good, to which statement he assented, but that I recognized that Anaconda could by one means or another produce the grade of metal demanded by its sales department. Obviously it would do us no good to make the task more difficult for Anaconda nor to increase its cost, *our principal interest being to avoid the production of additional High Purity zinc.* I indicated to him that in order to warrant us in asking for authority to grant such a license we would have to show sufficient advantage to the Zinc Company in the way of a royalty to justify such a departure from our policy. I said it was not very clear to me what such a royalty should be but that we would take the matter under consideration. Mr. Laist said he thought the total cost of the operation including royalty would be the

Digitized by Google

determining factor, and I undertook to give him an estimate of the probable cost based on the figures he gave me, together with our further views.

[s] C. G., *General Manager, Patents Department.*

CHG.JH
[Italics supplied.]
cc–Mr. M. L. Havey, Vice President.

New Jersey agreed to grant Anaconda a license under the fractionation process patents, as appears from a letter dated October 19, 1939, written by Mr. George of New Jersey to Anaconda. I quote (exhibit 11):

[Copy]

OCTOBER 19, 1939.

MR. FREDERICK LAIST,
General Metallurgical Manager,
Anaconda Copper Mining Company,
25 Broadway,
New York, N. Y.

DEAR MR. LAIST: Since our conversation last Monday I have consulted with our people about your request for a license on our refining process. As I understood your position you would like to consider the use of our process for the further purification of your product, now ranging from 99.97 to 99.99%, so as to give you a better competitive position, particularly in the die casting field.

* * * * * * *

We are prepared to grant to your Company a nonexclusive license under our United States patents relating to our zinc redistillation and refining processes for the production of not more than 30,000 tons (of 2,000 pounds each) of refined zinc metal per annum on the following general terms:

* * * * * * *

Grade of metal.—The Special High Grade metal now marketed by us ranges from 99.994 to 99.996% Zn, say, an average of 99.995%. We have been convinced as the result of extensive experimental work that metal of this analysis is eminently suitable for the manufacture of the die casting alloys now in general use and that the use of zinc of a higher degree of purity would not be of any advantage. Under present conditions we do not intend to engage in any market contest based on extreme purity of product and would expect your Company to join us in this policy and to keep its product within these limits.

* * * * * * *

Nonexport of product to territory licensed to others.—Your Company would undertake not to practice the licensed inventions except in the United States and perticularly not to export nor, so far as lies in its power, permit the export of the products of these inventions to any other country in which at the time we have licensed another with respect to these inventions. Upon taking a license your Company would be informed of the countries with respect to which licenses had already been granted, and from time to time thereafter it would be notified of any additional licenses issued. Your Company would undertake to comply with reasonable requirements from us as to the marking of the product of the inventions in such manner as would assist in identifying its origin and excluding it from entry into the prohibited territories.

General.—All agreements to which this Company is a party are subject to final approval by our Executive Committee. However, we express our willingness to recommend to our Executive committee for their acceptance the terms and conditions outlined in this letter (subject to the detailed terms and conditions of a formal agreement), providing we receive your acceptance of our offer within sixty days from this date. At the expiration of such period, unless further extended, our offer shall be considered as withdrawn.

Yours very truly,

[s.] C. G., *General Manager, Patents Department.*

C. H. George/JH
cc—Mr. Henry Hardenbergh, Mr. M. L. Havey.

As appears from a memorandum written by Mr. George of New Jersey dated October 20, 1939, one of the important considerations moving New Jersey to offer a license to Anaconda under the fractionation process patents was the

Digitized by Google

fear that Anaconda might sell its 99.99 metal at a differential under the special high grade zinc price. I quote from Mr. George's memordum (exhibit 12):

MEMORANDUM

OCTOBER 20, 1939.

* * * * * * *

* * * Mr. Laist indicated however, that he could get the lead down to a reasonable point by fractional condensation at a cost of about $4.00 per ton, but admitted that the yield would be only 50 percent. He pointed out also that by selling Special Intermediate metal at St. Louis at $3.00 premium over Prime Western, with $2.00 for Brass Special, he could pick up perhaps $7.00 in freight on delivery in the East as compared with a net of about $16.00 premium on High Grade, a difference of only $6.00 to $9.00 per ton. This leads to the most important consideration and that is that Anaconda might sell its 99.99 metal at a differential under the Special High Grade. Of course, this would probably lead eventually to adjustments by other producers also, with the result that in the end the relative position would be unchanged but with a lower level of prices all around.

* * * * * * *

C. H. G.

CHG.JH

From the foregoing documents it appears that in this instance New Jersey departed from its established policy of refusing licenses under its fractionation process patents for two reasons: (1) Anaconda was already producing high grade zinc by the electrolytic method, New Jersey's "principal interest being to avoid the production of additional high purity zinc," and (2) unless New Jersey offered the license Anaconda might sell its high grade zinc, slightly less pure than New Jersey's metal, at a differential under the established price for special high grade zinc.

Anaconda did not take a license from New Jersey under the fractionation process patents. We do not know the reasons for Anaconda's decision in this matter.

DOMESTIC APPLICATIONS

As already indicated, it has been the settled policy of New Jersey not to issue any domestic licenses under its fractionation process patents. The fractionation process inevitably produces zinc metal of the highest grade, regardless of the quality of the molten metal refined by the process. It has also been the settled policy of New Jersey not to grant domestic licenses under its vertical retort process patents for the production of high grade zinc.

Let us consider a few illustrations of New Jersey's domestic licensing policy with respect to both the fractionation process and the vertical retort process patents.

In May of 1930 New Jersey refused to license the Athletic Mining & Smelting Co., of Joplin, Mo., under the vertical retort process patents except upon the condition that the licensee's production by the licensed process should be of a quality no better than brass special and of limited tonnage. I quote from a letter written by Mr. George of New Jersey to Mr. Orr, president of the Athletic Mining & Smelting Co., dated May 26, 1930 (exhibit 13):

[Copy]

MAY 26, 1930.

Mr. CHARLES T. ORR,
President, Athletic Mining and Smelting Co.,
Joplin, Missouri.

DEAR SIR:

* * * * * * *

We wish to help stabilize the zinc industry and not to add to the demoralization already existing by indiscriminate licensing of our process. Our policy in this country, therefore, is to license only approved companies who are willing not only to explain their plans and disclose their standing in the industry to us but who we feel sure will handle the licenses to the best advantage of the zinc

Digitized by Google

industry as a whole. Also, we license the production only of metal of a quality not better than Brass Special and of limited tonnage.

* * * * * * *

Yours very truly,

[s.] C. G., *Manager, Patents Division.*

C. H. George/JH.

To members of the Antitrust Division, the term "approved companies" has come to have a well-defined meaning. To us it means an old established company in the industry, not a newcomer, and a company that believes firmly in the philosophy of limited production and price stability. It does not include a company that cuts prices.

In August of 1930 New Jersey refused to license the Constitution Mining & Milling Co., of Spokane, Wash., under its vertical retort process patents except upon the condition that the zinc metal produced by the licensed process contain no less than 0.5 percent total impurities, of intermediate grade, and be of limited tonnage (exhibit 14).

In June of 1936 New Jersey refused to license the American Metal Co. of New York City under New Jersey's fractionation process patents. I quote from an interoffice memorandum dated June 18, 1936, written by Mr. George of New Jersey (exhibit 15):

MEMORANDUM

JUNE 18, 1936.

Mr. Zimmer, of the American Metal Company, telephoned me this morning and asked about our policy relative to the zinc refining processes. I told him it was our policy not to grant license on these processes in this country. He said that had been his understanding, because he remembered that when we were talking about the vertical-retort process we had proposed to withhold license on the lead eliminator so that there would be no production of High Grade zinc. He said that, however, he had heard that a plant is being built at Armarillo by the American Smelting & Refining Company. I told him that was true but that that plant was limited in size and that the uses of its products were limited, also that the license was part of another arrangement. He indicated that he understood the circumstances and concluded the conversation by saying that "your policy, then, in this respect has not been changed," to which I answered in the affirmative.

C. H. G.

CHG.JH.

In August 1936 the American Zinc, Lead & Smelting Co., of St. Louis, Mo., sought to obtain a license from New Jersey under the vertical-retort process patents. By letter dated August 18, 1936 (exhibit 16), written by Mr. C. H. George, head of the Patents Department of New Jersey, to M. H. I. Young, president of the American Zinc, Lead & Smelting Co., New Jersey offered to license the American Zinc, Lead & Smelting Co. under the vertical-retort process patents for the production of approximately 75 tons of zinc metal per day on the condition that the zinc metal produced by the licensed process should be of a grade no better than brass special, and upon further condition that the licensee would not export zinc metal produced by the process to any other country in which at the time of export New Jersey had licensed another under corresponding foreign vertical-retort process patents.

On September 2, 1936, Mr. Young, of American Zinc, Lead & Smelting Co., wrote Mr. George, of New Jersey, and specifically inquired as to the grade of metal he would be authorized to produce under the contemplated license from New Jersey. I quote (exhibit 17):

AMERICAN ZINC, LEAD AND SMELTING COMPANY,
Mascot, Tennessee, September 2, 1936.

Mr. C. H. GEORGE,
General Manager, Patents Department, New Jersey Zinc Company,
160 Front Street, New York, N. Y.

DEAR MR. GEORGE:

* * * * * * *

* * * If we adopt the use of your process, we would, of course, prefer to produce all of our metal by same. It is my understanding, however, that if we

Digitized by Google

wish to produce the grades above Brass Special it will be necessary to produce by some method other than yours. I shall appreciate your advising me whether my understanding is correct.

* * * * * * *

Very truly yours,

[s.] H. I. YOUNG, *President.*

HIY: C.

Mr. George replied to this letter by telegram dated September 9, 1936, as follows (exhibit 18):

Date: Sept. 9, 1936. Time: 11:00 A. M.

To: H. I. YOUNG,
President, American Zinc, Lead & Smelting Co.,
943 Paul Brown Building, St. Louis, Mo.:

Reference your letter second instant and our acknowledgment fourth Stop In view of possible effect on our own business of increased production of grades above Brass Metal we are not willing to license such production by our vertical-retort process Stop Limitation in proposal contained in our letter of August eighteenth therefore remains unchanged.

THE NEW JERSEY ZINC COMPANY.

C. H. George/JH.

By letter dated September 10, 1936, Mr. Young of American Zinc, Lead & Smelting Co. again wrote Mr. George of New Jersey requesting reconsideration by New Jersey of New Jersey's requirement that the metal produced under the proposed vertical retort process patents license be of a grade no better than brass special. I quote from Mr. Young's letter of this date (exhibit 19):

AMERICAN ZINC, LEAD AND SMELTING COMPANY,
St. Louis, Missouri, *September 10, 1936.*

Via Air Mail

Mr. C. H. GEORGE,
General Manager, Patent Department, The New Jersey Zinc Company,
160 Front Street, New York, N. Y.

DEAR MR. GEORGE:

* * * * * * *

I should like for you to give further consideration to the decision you have arrived at in connection with the grade of metal. We shall be using in our plant by any process we use ores that on account of their purity produce metal of Intermediate grade. This metal has been going onto the market for a number of years, and we have customers that depend upon us for this supply. We cannot afford to take the metal and debase it, which will be necessary if we meet the guaranteed specifications you are insisting upon. We should like for you to give further consideration to permitting us to make all grades from Prime Western up to and including Special Intermediate, limiting us to a maximum annual production of grades better than Brass Special of 10,000 tons.

We are very much interested in the use of your process, and if we spend in excess of $1,000,000 for this installation, we would naturally expect to discontinue the operation of all our present type of retorts.

* * * * * * *

Very truly yours,

[S.] H. I. YOUNG, *President.*

HIY:MR

New Jersey refused to reconsider the matter, as appears from an interoffice memorandum written by Mr. George, of New Jersey, dated September 17, 1936. I quote (exhibit 20):

MEMORANDUM

SEPTEMBER 17, 1936.

Mr. Young came in yesterday afternoon as proposed in his letter of September 10. He said he wanted to ascertain whether our restriction to Brass Special grade of any metal produced in his proposed vertical retort plant would extend to a requirement that the metal product be degraded if it should be better than Brass Special. I told him that we would require that no metal better than Brass Special be produced or sold, even though it should be necessary to degrade the

Digitized by Google

product. I explained to him that while he might be able, as he said, to produce Intermediate metal by the horizontal retort method from the ore he proposes to use in the vertical retort plant, nevertheless we would not care to license under our patents the production of the higher grades of metal.

* * * * * * *

Mr. Young asked that I let him know if we find it possible to change our position with regard to the restriction on the grade of metal to be produced.

C. H. G.

CHG.JH

American Zinc, Lead & Smelting Co. declined the license on these terms. I quote from a letter written by Mr. Young to Mr. George dated January 8, 1937 (exhibit 21):

AMERICAN ZINC, LEAD AND SMELTING COMPANY,
St. Louis, Missouri, January 8, 1937.

Mr. C. H. GEORGE,
General Manager, Patents Dept., The New Jersey Zinc Company,
160 Front Street, New York, N. Y.

DEAR MR. GEORGE: We have given careful consideration to the use of your continuous retort at East St. Louis, and inasmuch as we would not be permitted under your license to make metal better than Brass Special grade, we find it will be impossible for us to consider this type of equipment.

If at any time within the next year your policy as to grade is changed, I shall appreciate your advising me.

* * * * * * *

Very truly yours,

[S.] H. I. YOUNG, *President.*

HIY:JT

On August 27, 1937, Mr. Young wrote Mr. George inquiring whether there had been any change in New Jersey's policy with respect to granting licenses under its vertical retort process patents.

By letter dated August 31, 1937, Mr. George replied as follows (exhibit 22):

[Copy]

AUGUST 31, 1937.

Mr. H. I. YOUNG,
President, American Zinc, Lead and Smelting Co.,
943 Paul Brown Building, St. Louis, Missouri.

MY DEAR MR. YOUNG: I have your letter of August 27, 1937, inquiring as to whether our policy with respect to the licensing of our vertical retort smelting process has been changed since your inquiry last year.

It is still our policy not to license this process in this country for the production of slab zinc of a grade better than Brass Special.

Yours very truly,

[s.] C. G., *General Manager, Patents Department.*

C. H. George/JH

In September 1938 Mr. Young appears to have again taken up the matter of a vertical retort license with New Jersey. An interoffice memorandum written by Mr. George dated September 16, 1938, reads as follows (exhibit 23):

MEMORANDUM

SEPTEMBER 16, 1938.

When Mr. Young and Mr. Seymour were here yesterday, I mentioned to Mr. Young that I would be glad to discuss with him the licensing of his Company with respect to our vertical retort smelting process on the basis of a production of fifty percent Intermediate and fifty percent Brass Special. Mr. Young said he was definitely interested and would like to confer with his people and then discuss the matter further with me when he is here during the last week of the month.

I pointed out to Mr. Young that such a license agreement would contain a restriction also on the exportation of the product of the vertical retort plant to any other licensed territory. I told him also that the royalty would be $3.00 per ton instead of $2.50 as quoted him before. I explained our reasons

Digitized by Google

for the change, particularly the improvement in the process both as to performance and economies, and the shortening of our patent period.

C. H. G.

CHG.JH

Apparently Mr. Young was still negotiating for a license from New Jersey in August 1939, as appears from exhibit 24 attached.

On July 24, 1940, Mr. Young was still negotiating with New Jersey, as appears from a letter of this date written by Mr. Young to Mr. Hardenburgh, vice president of New Jersey. I quote (exhibit 25):

ST. LOUIS, MISSOURI, *July 24, 1940.*

Mr. HENRY HARDENBURGH,
Executive Vice President, The New Jersey Zinc Company,
160 Front Street, New York, New York.

DEAR HENRY: I would appreciate your dropping me a note, at your convenience during the next week or ten days, advising of the best grade of metal you will permit us to produce and sell in the domestic market under license agreement covering the use of your continuous retort.

I know you restrict production of 99.99%, but would you like to know whether you will permit the production and sale of zinc covering the A. S. T. M. specifications of high-grade, which is 99.9% to 99.95%.

* * * * * * *

Very truly yours,

——— ———, *President.*

HIY: LJ

Mr. Hardenburgh replied to Mr. Young by letter of August 6, 1940, as follows (exhibit 26):

THE NEW JERSEY ZINC COMPANY,
August 6, 1940.

Mr. HOWARD I. YOUNG,
President, American Zinc, Lead and Smelting Company,
943 Paul Brown Building, St. Louis, Missouri.

DEAR MR. YOUNG: Your letter of July 24th having to do with the possibilities of producing various grades of slab zinc in our vertical retorts has raised a new question which is somewhat disturbing. Before making any formal reply to your inquiry I think it might be well if you and I could sit down together and discuss just what you have in mind in this connection.

If you will let me know when you next expect to be in New York, I will hold myself available.

Very truly yours,

[S.] HENRY HARDENBERGH, *Vice President.*

Henry Hardenbergh/O.

We do not know what happened at the meeting between Mr. Young and Mr Hardenbergh. We would be very much surprised to find that New Jersey offered Mr. Young a license which would permit him to produce high-grade zinc under New Jersey patents. Such an offer would be contrary to New Jersey's frequently announced policy. In September 1940 Mr. Young's company, the American Zinc, Lead & Smelting Co., purchased the old Evans-Wallower zinc plant at East St. Louis, Ill. and we understand that this plant is now producing high-grade zinc by the electrolytic method.

In June 1936 New Jersey refused to grant a license for the production of high-grade zinc by the vertical retort process to the St. Louis Smelting & Refining Co. of St. Louis, Mo. An interoffice memorandum written by Mr. George, of New Jersey, dated June 29, 1936, reads as follows (exhibit 27):

MEMORANDUM

JUNE 29, 1936.

On June 23, 1936, Mr. J. A. Caselton, Second Vice President and Secretary of the St. Louis Smelting & Refining Company (a subsidiary of the National Lead Company), 722 Chestnut Street, St. Louis, Mo., called on Mr. Spencer to discuss the possibility of obtaining a license for their affiliated company, the Combined Metals Reduction Company, with respect to the vertical retort furnace. He said they were considering what should be done with the ore from their properties in Nevada in the Pioche-Comet Districts and wanted to include the vertical retort process in their considerations. It is proposed to build a plant in Utah,

Digitized by Google

apparently in the Salt Lake Valley (where it is probable that natural gas from the Wyoming fields is available). * * * Mr. Spencer told Mr. Caselton that we do not grant licenses in this country for the production of High Grade zinc, but Mr. Caselton, while indicating that they desired to make High Grade zinc, suggested that he would like to have some information about the process anyway. Mr. Spencer brought him down to me and asked me to take care of the inquiry. * * *

* * * After consultation with Mr. Hayes, Mr. Spencer directed me to call on Mr. Carter, President of the National Lead Company, and discuss this matter with him. I went over to see Mr. Carter on June 24 and explained the situation to him. I first took occasion to express on behalf of Mr. Hayes regret that we found ourselves unable to cooperate fully with the National Lead Company in that we could not consistently grant that Company a license under our process to produce High Grade zinc because of the effect on our own High Grade zinc business. I told him that there was already too much production and that it would not be consistent for us to add to our own difficulties by being a party to the bringing in of new production by another. I remarked that Mr. Caselton had said that the withholding by us of a license to them on the vertical retort furnace would not necessarily keep them out of the High Grade zinc business, as they might adopt the electrolytic method; the answer was, of course, that while that might be true, we had been under pressure for a long time from other producers for such licenses, and we could not hope to make them understand the difference between granting a license to a newcomer and the granting of licenses to established smelters. Mr. Carter indicated his acquiescence in that point of view.

* * * I cited Mr. Spencer's statement to Mr. Caselton that we could not license the production of High Grade zinc and suggested that it might well be that such a limitation would have the effect of eliminating our process from consideration. * * *

Mr. Caselton said that there did not appear to be much attraction for anyone to go into the High Grade zinc business if the industry is already overproducing. He said he had understood sometime ago through Mr. Doehler, who is a member of their Board, that there was a shortage of High Grade zinc and that Mr. Doehler had been experiencing some difficulty in securing adequate supplies for his die casting business. I told Mr. Carter that that condition had passed, that the shortage had been more apparent than real, and that it seemed a good many of the consumers had overbought their positions. I pointed out to him that the situation now is relatively easy and that the market is off five points. * * *

CHG.JH

In February 1941 the National Lead Co. of St. Louis, Mo., endeavored to obtain a license for the production of high-grade zinc by New Jersey's fractionation process. It will be recalled that the National Lead Co. is the parent corporation of the St. Louis Smelting & Refining Co., which company in 1936 had unsuccessfully sought a license from New Jersey for the production of high-grade zinc by the vertical retort process. The National Lead Co. was no more successful in obtaining a license from New Jersey for the production of high-grade zinc in 1941 than its subsidiary had been in 1936. New Jersey not only refused a license to the National Lead Co. but endeavored to discourage the National Lead Co. from producing high-grade zinc by any process. I quote from an interoffice memorandum written by Mr. George, head of New Jersey's patent department, on February 20, 1941 (exhibit 28):

MEMORANDUM

FEBRUARY 20, 1941.

By appointment, Mr. Paul brought in this afternoon Mr. Jean McCallum of the National Lead Company, St. Louis, who had expressed interest in our refining processes. Mr. McCallum opened the discussion by inquiring whether it would be possible to arrange for the refinement by our methods of Prime Western zinc. I replied by inquiring whether the Prime Western zinc he had in mind was metal already available or would come from new production. Mr. McCallum was not inclined to give a direct answer to the question, indicating that it might be either or both. I told him that the answer would be different in the

Digitized by Google

two cases. I explained that it is our policy not to grant licenses in this country with respect to these refining processes, although we had granted a limited license to the American Smelting and Refining Company for one unit with paid-up consideration as a part of the settlement of a patent dispute. I told him further that so far as our refining metal for someone else is concerned, we would have to give first attention to the requirements of the Government under the present emergency. I indicated that the Government already has our refining capacity under its consideration and that, of course, we must meet its requirements either from our existing active capacity, our reserve capacity or from new capacity to be created. I told him I thought there would not be much chance under present conditions of having metal refined except at the behest of the Government. I pointed out to Mr. McCallum that so far as new production would be concerned I did not believe the spread in price of one cent between High Grade and common metal would be sufficient, after allowing perhaps half for freight and other expense, to pay for the cost of refining and leave enough profit for division between two parties. He seemed to be inclined to agree with this view.

In further discussion Mr. McCallum remarked that they had had under consideration for a good many years the construction of an electrolytic plant in Nevada, probably near Las Vegas, where advantage could be taken of Boulder Dam power, for the treatment of ore from their Pioche District. He said that for some years they had been producing ore in that District and selling it all to the Anaconda Company. He seemed to think it would be necessary for them to produce High Grade zinc in order to make the project commercially practicable. I mentioned briefly my conversation in 1936 with Mr. Caselton on this same subject. I referred to the urge for production of zinc in the world under present conditions and the expanded capacity for production being created, and expressed the opinion that when the present emergency is over the zinc industry will be in for a period of severe adjustment. I mentioned particularly the effect on the applications of High Grade zinc of the efforts now being made to divert zinc from these uses with the substitution of other materials and expressed the opinion that it will take a long time to regain the lost markets. Mr. McCallum said these were among the considerations that had caused them to hesitate but that he was exploring the situation. He said I had given him all the information he required for his present purposes but that he would get into communication with us again if he found he needed anything additional.

In May 1937 New Jersey refused to license the United States Steel Corporation under the fractionation process patents. I quote from an interoffice memorandum written on May 12, 1937, by Mr. George, head of New Jersey's patents division (exhibit 29):

MEMORANDUM

MAY 12, 1937.

Mr. Queneau came in today and inquired of me as to whether we would grant to the United States Steel Corporation a license with respect to our zinc refining processes for a production of 12,000 tons per year. Mr. Queneau referred to the development of their new galvanizing process which utilizes high purity zinc and said that he would be willing to engage that the entire production of refined zinc should be used by the American Steel & Wire Company and other subsidiaries of the Corporation and none sold in the market. He indicated that such a plant would be located at Donora, where he said they now have a capacity of 72,000 net tons of common metal per year. * * *

Earlier in the conversation Mr. Queneau had been complimentary in his references to the fulfillment by the Zinc Company of its obligations with respect to delivery and price, not only *during the recent shortage of metal*, but at the beginning of the War. He recalled that Mr. Farrell, then President, had mentioned that the Zinc Company was one of the few companies that had lived up to their contract obligations with respect to both deliveries and price.

I reported the substance of the conversation to Mr. Spencer, and a little later he directed me to tell Mr. Queneau that it is our policy not to grant licenses in this country with respect to these refining processes because of the effect on our own business. He said I should say to Mr. Queneau, however, that we are ready to enter into a contract with the Corporation to supply it with the 12,000 tons of high purity zinc estimated as its requirements for next year. He

Digitized by Google

said we would be willing even to enter into a contract for the following year also if that were desired.

The Minerals Yearbook (published by the Bureau of Mines) tells us that "the recent shortage of metal" referred to in this memorandum of May 12, 1937, was attributable to a power shortage in Montana. As a result of the power shortage the Anaconda Copper Mining Co. was forced to close its electrolytic plants at Great Falls and Anaconda, Mont. during the months of January and February 1937 and was forced to operate these plants at reduced capacity for a considerable period of time. The resulting shortage of zinc that existed was particularly a high-grade zinc shortage, and foreign metal was imported in large quantities to meet domestic needs. Thus on June 18, 1937, the Societe Generale des Minerais of Brussels, Belgium, wrote New Jersey as follows (exhibit 30):

SOCIETE GENERALE DES MINERAIS, SOCIETE ANONYME,
June 18, 1937.

THE NEW JERSEY ZINC COMPANY,
160 Front Street, New York.

(Attention Mr. George, General Manager Patents Division.)

99.99% ZINC

DEAR SIRS: We have learnt through the commercial data which we receive from America that there is a considerable shortage of Fine Zinc in the U. S. A. and that moreover some quantities of European Electrolytic zinc have been sold in U. S. A.

We are therefore taking the liberty, in the event that this is useful and agreeable to you, of placing at your disposal a certain tonnage of 99.99 Zinc for import into the U. S. A.

* * * * * * *

Yours very truly,

SOCIETE GENERALE DES MINERAIS, SOCIETE ANONYME.

The point we wish to bring out here is simply this: In 1937 a shortage of hydroelectric power resulted in an acute shortage of high-grade zinc in this country, even in normal times. Today the demand for hydroelectric power is greater than ever before. Today the demand for high-grade zinc is greater than ever before. It is impossible to alleviate the present shortage of high-grade zinc by the importation of metal from Europe, as was done in 1937. Indeed, we must now export high-grade zinc to England, Russia, and China. Clearly, expanded facilities for the production of high-grade zinc should embody the New Jersey processes which do not require hydroelectric power and not the electrolytic process which is dependent upon an abundance of hydroelectric power. In addition, as already pointed out, plants embodying New Jersey processes can be built in less time and at less cost than electrolytic plants.

On August 22, 1940, New Jersey offered to license the United States Steel Corporation under the vertical retort process patents, subject, however, to the restriction that all of the metal produced by the licensed process should be used by the licensee or its subsidiaries in their own manufacturing operations, and none of the metal should be sold in the open market. New Jersey proposed to restrict the use of the metal to the licensee's own manufacturing operations, notwithstanding the fact that New Jersey was in doubt as to whether such a restriction was legal. Thus an interoffice memorandum written by Mr. George, of New Jersey, dated July 26, 1940, reads as follows (exhibit 31):

JULY 26, 1940.

Mr. HENRY HARDENBERGH,
Vice President:

We have here two questions:

1. May we properly limit the license to the production of slab zinc for use only in the operations of the licensee, none to be offered for sale to others?

Digitized by Google

Mr. Davis thinks we may do so. Mr. Wing thinks we may not, but he believes we may properly limit the grant to a specified maximum tonnage.

Following the suggestion by Mr. Wing in the last paragraph of his letter, I suggest that we introduce into the preamble of the license agreement a clause reading as follows:

> "Whereas, the Licensee desires to utilize the process and apparatus embracing the said inventions for the production of slab zinc for use in its own manufacturing business, its requirements for such purposes being estimated at 73,000 tons per annum, and."

I think we should then show in the granting clause that the license is "for the production of slab zinc for use only in the operations of the licensee, none to be offered for sale to others." We have the advice of eminent patent counsel, Mr. Davis, that such a limitation would be in accordance with the law as confirmed by the Supreme Court. The prospective licensee, so far as he is concerned, is agreeable to the limitation; apparently no public question would arise, for the Corporation heretofore has not been a seller of zinc, so whatever process is adopted and used by it there will be no effect on the market situation. It seems unlikely, therefore, that any question about the propriety of such a limitation would arise from any source. Even if the situation should develop unfavorably, the onus on us would not be much greater than it is now; our license agreement with the AS&R Company with respect to our zinc refining processes, under which we limit the use of the product of those processes, already has us committed to such a position.

2. May we properly limit the grade of the product of the licensed process?

Mr. Wing thinks we may not, and Mr. Davis regards the matter as extremely doubtful.

As Mr. Davis points out, the implications in connection with this point are much more unfavorable. And here the prospective licensee is unwilling to accept such a limitation, so that even if a license so limited finally should be taken, we might expect constant pressure for revision. The danger of a public question arising also would be greater, I think, than in the other case, because here the situation as to High Grade zinc would come into question, and our market position could probably be shown to be directly affected by any such limitation imposed upon the Steel Corporation, particularly if such a license position should be extended to include additional companies.

For these reasons, I think we are not warranted in attempting any limitation as to grade. We can save our position in this instance, as well as it can be saved—short of refusing a license, by restricting production under such license to the requirements of the licensee for his own use, a course seemingly warranted by advice of counsel.

[S.] C. H. GEORGE,
General Manager, Patents Department.

CHG.JH

New Jersey's offer to license United States Steel under the vertical retort process patents, subject to the restriction indicated, was extended into 1941 (exhibit 32). We do not know whether United States Steel has accepted the restrictive license offered by New Jersey.

THE CANADIAN APPLICATION

As early as 1929 the Consolidated Mining & Smelting Co. of Canada became interested in New Jersey's vertical retort process. On November 26, 1929, a Mr. Diamond of Consolidated and a Mr. Stiles, chief engineer of Consolidated, visited Mr. George of New Jersey in this connection. I quote from Mr. George's report of the conversation (exhibit 33):

"* * * Mr. Diamond said that they are contemplating the construction of a smelting plant in the eastern part of Canada and are desirous of seeing our furnace before deciding upon the kind of plant they will build. He said that neither he nor Mr. Stiles are very familiar with pyrometallurgical operations as all their experience has been in the electrolytic end. He remarked that they are producing 450 tons of lead per day and 300 tons of zinc at Trail, also a large quantity of silver. Their power situation at Trail apparently is not entirely

Digitized by Google

satisfactory as they are now experiencing a shortage of water for power purposes the same as the municipalities on the Northwest Coast.

"C. H. G."

Mr. Diamond and Mr. Stiles were shown New Jersey's vertical retort plant at Palmerton, Pa. Thereupon Mr. Diamond and Mr. Stiles again visited Mr. George on November 29, 1929. I quote from Mr. George's report of the conversation on this date (exhibit 34):
